later both Saxons and Franks were added to its population. The Carolingian kings ruled over it by means of a number of counts, among whom those of Hameland, Teisterbant (Testrebante), and Nimeguen were the most prominent; but hitherto it has not been discovered how these counts are connected with the later dynasty of the counts of Guelderland and Zutphen, which makes its appearance in the 11th century. There is documentary proof at Braunweiler of the existence of a Count Otto at the end of the 10th century, and a charter of 1096 is sealed by Gerhard of Gelder. Count Gerhard II. of Gelder married Ermgard of Zutphen, and their son Henry succeeded to the double inheritance. Both Henry (1131-1182) and his son and successor Otto I. (1182-1207) considerably extended their domains, and Otto deserves to be remembered for the civic rights which by a happy innovation he bestowed on the town of Zutphen in 1190. Gerhard III. (1207-1229) obtained from the emperor Frederick II. the right of removing the toll of Arnheim to Lobith, where it long proved the principal source of income to the countship. Otto II., son of Gerhard III., greatly augmented his power and territory, and secured the internal stability of his government by erecting numerous free communes, such as Harderwijk, Arnheim, Emmerich, Lochem, &c. Reinald I. (1271-1326) had the chagrin of seeing the dukedom of Limberg, which fell to him by the death of his father-in-law, seized by John I. of Brabant in 1288; but from the emperor Henry VII. he received, in 1310, the right of bestowing full municipal privileges on any free communities he might establish, and in 1317 he was raised to the rank of prince of the empire by Frederick of Austria, which implied possession of legislative authority and liberty to coin his own money. A steady increase of power rewarded the exertions of Reinald II. (1326-1339), and shortly before his death (March 19, 1339) he received the hereditary title of duke of Guelderland from the emperor Louis of Bavaria. The new duchy, however, had an ill beginning of its history. Reinald III., the natural successor, found a bitter rival in his brother Edward, and in 1361, after a contest of eleven years, he was completely defeated in the battle of Tiel; and though ten years later, on Edward's death, he recovered his rightful position, he survived his restoration only three months. A protracted contest between the hostile factions was at length decided in favour of William a nephew of the last duke, and son of William of Juliers, who succeeded in 1378, but did not receive imperial recognition till 1383. Between 1384 and 1386 he assisted the Teutonic knights against the Prussians; and in 1393 he became duke of Juliers by the death of his father. He died 16th February 1402, and was followed by his brother Reinald IV., whose reign of three and twenty years was mainly noticeable for several contests with Holland, the surrender of Emmerich and other portions of territory, and the gradual consolidation of the Guelderland states. Reinald IV. dying childless in 1423, the coronet passed to his grand-nephew Arnold, the son of John of Egmond. Arnold of Egmond was at first recognized by the emperor Sigismund in 1424, but in 1425 the emperor revoked his sanction, and gave his support to Adolphus of Cleves. In the war that followed the people of Guelderland stood true to Arnold, but his extravagance and carelessness brought the financial affairs of his duchy into confusion; and at length, in 1444, after the defeat of his forces by Adolphus at Linnich, he was constrained to pawn part of his territory to Cleves. The states had complained of the maladministration in a diet of 1436, and the malcontents ultimately, in 1456, found a leader in the duke's own son Adolphus, who, after an apparent reconciliation with his father made the old man a prisoner in January 1465, and confined him in the castle of Büren. A civil war now broke out, and Charles the Bold of Burgundy

seized the opportunity for his own advantage; in 1471 Adolphus was forced to set his father at liberty; and Arnold, in return for the service done him, made over his duchy to the Burgundian duke for 20,000 gulden, only reserving the usufruct till the close of his own life. On 23d February 1473 Arnold died, and Charles was duke of Guelderland. The town of Nimeguen made an heroic effort to oppose the Burgundian accession, but it fell after a lengthened siege. On Charles's death at the battle of Nancy in 1477, a party in the powerful city of Ghent became anxious to marry Charles of Egmont to their princess, Mary of Burgundy. Before the year was out, however (29th June 1477), the young man had perished before the walls of Tournay, against which he had led an army of Burgundians and Flemings to recover it from the French. By his marriage with the Princess Mary, Maximilian of Austria considered himself the rightful possessor of Guelderland, and he succeeded by 1482 in quelling all opposition. But ten years later young Charles of Egmond, the son of Adolphus, set foot once more in his native country; the people soon flocked to his standard; and victorious campaigns proved the capacity of the leader and the enthusiasm of the soldiers. The fierce contest continued for years, and Charles carried the war into the enemy's territories. In 1507 he pushed into Holland and Brabant, in 1512 appeared before Amsterdam, and in 1514 made capture of Groningen. It was not till 1528 that Charles V. granted him the lifelong occupation of Guelderland, Zutphen, Groningen, Coevorden, and Drenthe. In return he agreed that if he died childless his possessions should revert to the emperor; but such was his hatred of the house of Austria that towards the close of his life he planned to make France his heir. This, however, was prevented by the states of Guelderland insisting on his appointing as his successor William, the youthful son of the duke of Cleves and Juliers. Charles died 30th June 1538, and William assumed the title of duke. But Charles V. was not disposed to give up the rights secured by the treaty of Gorinchem, and after a contest in which much damage was done to various parts of the Low Countries, William was obliged to surrender his claims on 7th September 1543. On the rise of the Dutch republics most of Guelderland threw off the Spanish yoke. One "quarter" only, that of Roermonde, continued subject, and it received the name of Spanish Gelderland; the other three "quarters," Nimeguen, Zutphen, and Arnheim, became Dutch Guelderland, and had their provincial diets twice a year. By the peace of Utrecht Spanish Guelderland or the Upper Quarter (Overkwartier) passed to Prussia, including the town of Guelders, but excluding Venloo, which went to the Netherlands, and Roermonde, which went to Austria. By the peace of Paris (1814) the temporary divisions of the French revolutionary period were abolished, and all Guelderland was incorporated with Holland except the portion which still forms the Prussian circle of Düsseldorf.

GUELDERLAND, the modern province of the Netherlands, has an area of 1932 square miles, and its population in 1821, 1835, 1840, 1860, and 1873 was respectively 269,926, 323,167, 345,762, 401,864, and 437,778. The largest towns are Nimeguen (23,509 in 1876), Arnheim (38,017), Zutphen (14,513), Apeldoorn (13,851), Ede (10,982), and Rheden (10,536); and there are at least eighteen other communes with more than 5000 inhabitants.

See Pontanus, *Historie Geldriae* (Harderwijk, 1639); Van Spaen, *Historie van Gelderland* (Utrecht, 1814); Nijhoff, *Gedankwaardigheden uit de Geschiedenis van Gelderland* (Arnheim, 1830, &c., 6 vols.); Nijhoff, *Het vornaemste uit de geschiedenis van Gelderland* (Arnheim, 1869); J. C. Kremer, *De Graven van Hameland, en de Oorsprong der Graven van Nassau, Gelre, Cleve, en Zutphen* (Arnheim, 1873); Baron Sloet, *Oorkondenboek der Graafschappen Gelre en Zutphen*; P. H. Witkamp, *Aardrijkskundig Woordenboek van Nederland*, 1877.

GUELDER ROSE, so called from Guelderland, its supposed source, termed also Marsh Elder, Rose Elder, Water Elder (Germ., *Wasserholder*, *Schneeball*; Fr., *Viorne-Obier*, *l'Obier d'Europe*), the *Viburnum Opulus* of Linnæus, is a shrub or small tree of the natural order *Caprifoliaceæ*, and a native of Britain and other parts of Europe, and of Russian Asia. It is common in Ireland, but rare in Scotland. In height it is from 6 to 12 feet, and it thrives best in moist situations. The leaves are smooth, 2 to 3 inches broad, with 3 to 5 unequal serrate lobes, and glandular adnate stipules. In autumn the leaves change their normal bright green for a pink or crimson hue. The flowers, which appear in June and July, are small, white, and arranged in cymes 2 to 4 inches in diameter. The outer blossoms in the wild plant have an enlarged corolla, $\frac{3}{4}$ inch in diameter, and are devoid of stamens or pistils; in the common cultivated variety all the flowers are sterile, and the inflorescence is globular, hence the term "Snowball Tree" applied to the plant, the appearance of which at the time of flowering has been prettily described by Cowper in his *Winter Walk at Noon*. The guelder rose bears juicy, red, elliptical berries, 4 lines in length, which ripen in September, and contain each a single compressed seed. In northern Europe these are eaten, and in Siberia, after fermentation with flour, they are distilled for spirit. The plant has, however, emetic, purgative, and narcotic properties; and Taylor (*Med. Jurisp.*, vol. i. p. 448, 2d ed., 1873) has recorded an instance of the fatal poisoning of a child by the berries. Both they and the bark contain valerianic acid. The woody shoots of the guelder rose are manufactured into various small articles in Sweden and Russia. See London, *Arboretum*, vol. ii., 1838; and Syme, *Eng. Bot.*, iv. p. 202, pl. 639.

GUELDERS, or GELDERN, a town of Rhenish Prussia, in the government district of Düsseldorf, chief and only town of the circle of Geldern, is situated on the Niers, 28 miles N.W. of Düsseldorf. Its industries include the manufacture of cloth and hats, wool-spinning, and wool, silk, and linen weaving. It has a Catholic and a Protestant church and two convents. The town was built in 1097, and was till 1343 the residence of the counts and dukes of Guelderland. It was fortified by Philip II., but its fortifications were razed by Frederick II. of Prussia in 1764. The population in 1875 was 5184.

GUELFS and Ghibellines. The names Guelfo and Ghibellino, as applied to parties in Italy, are Italianized forms of names which at an earlier period designated parties in Germany. Guelfo is the Italian form of Welf, and Ghibellino the Italian form of Waiblingen, a castle of the emperor Conrad. In Germany these names, which are said to have been first used as battle-cries at the battle of Weinsberg in 1140, designated the struggle between the Welfs of Altdorf and the imperial line of the Hohenstaufen. In Italy the names acquired a different meaning, being generally applied respectively to the party of the pope and the party of the emperor. The conflict between the authority of the emperor and the independence of the Italian towns began before the names were used in Germany. These parties first came into prominence in the Lombard league of 1167. In the war which followed we find the following distribution of parties: on the Ghibellin side were Cremona, Pavia, Genoa, Tortona, Asti, Alba, Acqui, Turin, Ivrea, Ventimiglia, Savona, Albenga, Imola, Faenza, Ravenna, Forli, Cesena, Rimini, the marquis of Montferrat, the counts of Lomello, Guasto, Bosio, &c.; on the side of the Guelfs were Venice, Treviso, Padua, Vicenza, Verona, Brescia, Ferrara, Mantua, Bergamo, Lodi, Milan, Novara, Vercelli, Alessandria, Piacenza, Parma, Reggio, Modena, Bologna. These names spread further in consequence of the bitter rivalry which existed between several pairs of Italian towns, for instance, between Rome and Tusculum, Pisa and Genoa,

Ferrara and Mantua, Bergamo and Brescia. A further step in this direction was the division of the towns themselves into Guelf and Ghibellin parties. The struggle for the imperial throne between Philip of Swabia and Otto of Brunswick (1198–1208) enlisted the sympathies of Italy. The Guelfic towns Milan, Piacenza, Brescia, Reggio, Modena, took the part of the Welf Otto. The 13th century witnessed a great increase of the jealousies between rival towns, and more serious divisions of the leading families in the towns themselves. Examples of this were the quarrels between the Montecchi and Capelletti at Verona, the Lambertazzi and Geremei at Bologna, the Rossi and Coreggi at Parma, the Doria and Spinola, the Grimaldi and Pieschi at Genoa, the Buondelmonti and Amedei, the Donati and Uberti at Florence, the Colonna and Orsini at Rome, the Bagnacavalli and Polenta at Ravenna, the Delle Torre and Visconti at Milan, the Cancellieri and Panciatichi at Pistoia, the Salimbeni and Tolomei at Siena.

Of the principal towns in North and Central Italy, Arezzo was generally Ghibellin. Bergamo was torn in sunder by party quarrels: the Suardi fought against the Coleoni, and afterwards both these against the Rivoli and Bonghi; it was generally more Guelf than Ghibellin. Bologna was generally Guelf. Brescia was much divided. It was generally Guelf, but was conquered by the Ghibellins in 1322. It came under the power of the Visconti of Milan in 1337. Cremona was generally Guelf, but occasionally Ghibellin. Always unhappy, it was wasted by the most violent party conflicts. The family of Cavalcabò led the Guelf party in this town in the 14th century. Ferrara was Ghibellin under the Torelli; it became Guelf under the Este. Florence, after 1158, was the chief support of the Guelfs. The struggles which desolated it were between different branches of the Guelf—the Bianchi, and Neri, and others. Forlì was Guelf till 1315, afterwards Ghibellin under the Ordelaffi. Genoa was divided between the two parties. Lucca was generally Ghibellin, but had hard work to maintain its position against the attacks of Florence. Mantua was Guelf up to 1220, afterwards mainly Ghibellin. Padua was the enemy of Venice; in 1227 it was Guelf, fighting against the Ghibellin Vicenza; about 1318 it became Ghibellin under the house of Carrara. Parma was divided in its sympathies. It was generally more Guelf than Ghibellin. Pavia was Ghibellin unless compelled to be otherwise. Perugia became Guelf in 1198. It was much torn by party quarrels. Piacenza was generally Guelf. Pisa was chiefly Ghibellin during a great part of its history. Pistoia was divided up to 1267, after which time it became mainly Guelf. Ravenna was chiefly Guelf under the family of Polenta. Rimini belonged to the family of Malatesta, which was divided between Guelf and Ghibellin. Siena was at first Ghibellin; in 1270 it became Guelf. Venice was scarcely touched by these party quarrels. Verona was much divided. Up to 1259 it was mainly Guelf; under the Della Scala it was Ghibellin. Vicenza was Ghibellin after 1227; at a later period it followed the fortunes of Padua. Viterbo was Ghibellin after 1328.

It would be generally true to assert the principle that the Guelfs were more attached to liberty than the Ghibellins. The town of Alessandria was the creation of the Lombard league, a protest against the reduction of Italy under a German sovereign. Yet Dante, the keenest patriot, the most ardent aspirant towards the unity of Italy, was a Ghibellin. With him Ghibellinism meant (1) unity under a strong head, and (2) the abolition of the temporal power of the popes. No one, he thought, but an emperor could sit firmly in the saddle or guide the reins of so fierce a steed. The best hope of obtaining this object lay in Henry VII. of Luxembourg. But the object itself was probably impossible of realization. The death of Henry at Buonconvento

extinguished the last hope of uniting Italy under the supremacy of Cæsar.

To give a full account of the party quarrels of Guelf and Ghibellin would be to write the history of mediæval Italy. The names began to die out gradually at the beginning of the 15th century. Twenty years before the two parties had united in opposing John of Bohemia. The expedition of Charles IV. into Italy destroyed what shreds still remained of respect for the authority of the empire, and with the extinction of Ghibellinism Guelfism perished also; yet we find the name of Guelf appearing in Milan in 1404, after the death of Gian Galeazzo Visconti, and also in 1447, in the struggle between Ludovico Sforza and the Duchess Bona of Savoy. In the conquest of Milan by Louis XII., in the beginning of the 16th century, we find the supporters of the emperor and Sforza called Ghibellins by Roman writers, and the French party called Guelf.

Of the literary supporters of either cause we can only mention a few. Brunetto Latini, the master of Dante, was a Guelf. Dante himself, as we have seen above, was a Ghibellin; so was his friend Guido Cavalcanti. Petrarch was a Guelf; the three historians Villani are singularly impartial. For further information, see Wachsmuth, *Geschichte der Politischen Parteinungen*, vol. ii. (o. v.)

GUERLPH, the chief town of Wellington county, Ontario, Canada, is situated in a fine agricultural district on an elevation on the river Speed, a branch of the Grand River, and on the Grand Trunk Railway and the Wellington, Grey, and Bruce division of the Great Western Railway, 45 miles west by south of Toronto. The river is navigable at this point, and there is a considerable shipping trade in wheat. Abundant water power is obtained for flour-mills, saw-mills, and woollen-mills, and there are also breweries, tanneries, and manufactories for agricultural instruments and sewing machines. The population in 1871 was 6878.

GUERCINO. See BARBIERI.

GUÉRET, a town of France, chief town of the department of Creuse, is situated on a mountain declivity near the Creuse, about 250 miles south from Paris. It has a church of the 13th century, a communal college, a normal school, two hospitals, a botanical garden, a library, a picture gallery, and a museum for natural history and antiquities. The principal industries are the manufacture of beer, leather, potash, combs, and buttons; and there is a considerable trade in wood and cattle. Guéret grew up in the 8th century round an abbey founded by Clotaire in 720. The population in 1876 was 4973.

GUERICKE, OTTO VON (1602–1686), an experimental philosopher, distinguished by his original discoveries of the properties of air, was born at Magdeburg, in Prussian Saxony, November 20, 1602. Having studied law at Leipsic, Helmstädt, and Jena, and mathematics, especially geometry and mechanics, at Leyden, he visited France and England, and, returning to Saxony, took up the profession of engineer-in-chief at Erfurt. In 1627 he was elected alderman of Magdeburg, and in 1646 mayor of that city, and a magistrate of Brandenburg. It was whilst holding these offices that Guericke devoted his leisure to scientific pursuits, especially in pneumatics. Incited by the discoveries of Galileo, Pascal, and Torricelli, he attempted the creation of a vacuum, a desideratum in science from before Aristotle. He began by experimenting with a pump on water placed in a barrel, but found that when the water was drawn off the air permeated the wood. He then took a globe of copper fitted with pump and stopcock, and discovered that he could pump out air as well as water. Thus Guericke became the inventor of the air-pump (1650). This important discovery was publicly explained before the emperor Ferdinand III. at the imperial diet which assembled at Ratisbon in 1651. Guericke at the same time

illustrated in a simple but effective way the force of atmospheric pressure. Placing side by side two hollow hemispheres of copper, he exhausted the air from between them by means of pump and stopcock, and it is recorded that thirty horses, fifteen back to back, were unable to pull them asunder. The apparatus used on this occasion is still preserved in the imperial and royal library at Berlin. Guericke further demonstrated, by the aid of the air-pump, that in a vacuum all bodies fall equally fast, that animals cannot exist therein, and other phenomena. He also invented the air-balance, and the anemoscope, a species of weathercock. The discovery of the property of electro-repulsion is also attributed to him; and he made successful researches in astronomy, predicting the periodicity of the return of comets. In 1681 he gave up office, and retired to Hamburg, where he died May 11, 1686.

His principal observations are given in his work, *Experimenta nova, ut vocant, Magdeburgica de vacuo spatio* (Amsterdam, 1672). He is also the author of a *Geschichte der Belagerung und Eroberung von Magdeburg*. See Hoffmann, *Otto von Guericke*, Magdeburg, 1874.

GUÉRIN, GEORGES MAURICE DE (1810-1839), a French poet, whose few compositions in prose and verse, published posthumously, show him to have possessed a true and rare genius, was descended from a noble but poor family, and was born at the château of Le Cayla in Languedoc, 4th August 1810. He was educated with a view to the church at a religious seminary at Toulouse, and then at the Collège Stanislas, Paris, after which he procured entrance to the society at La Chesnaye in Brittany, founded by Lamennais, bishop of Rennes. Here his most intimate companions were persons whose tastes were literary rather than ecclesiastical; and his dreamy and meditative temperament found its solace and happiness more in intercourse with nature than in theological study or the exercises of piety. It was therefore only after great hesitation, and without being satisfied as to his religious vocation, that under the influence of Lamennais he joined the new religious order in August 1833; and when, in September of the same year, Lamennais, who had come under the displeasure of Rome, severed connexion with the society, Guérin's doubts as to his vocation returned in full force, and on the 7th October he renounced his novitiate. Early in the following year he went to Paris, where he obtained an engagement on the periodical press, but finding it impossible to submit to the mental drudgery of continuous literary work he became a teacher at the Collège Stanislas. In November 1838 he married a Creole lady of some fortune; but a few months afterwards he was attacked by a malady which proved to be consumption, and which terminated by death his short period of leisure and happiness, 19th July 1839. In the *Revue des Deux Mondes* for May 15, 1840, there appeared a notice of Guérin by George Sand, to which she added two fragments of his writings—one a composition in prose entitled the *Centaur*, and the other a short poem. His *Reliquie*, including the *Centaur*, his journal, a number of his letters, and several poems edited by G. S. Trébutien, and accompanied with a biographical and critical notice by Sainte-Beuve, appeared in 1860 in two volumes; and a translation of it was published at New York in 1867. Though Guérin was essentially a poet, his prose is more striking and original than his poetry. Its peculiar and unique charm arises from his strong and absorbing passion for nature, a passion whose intensity reached almost to adoration and worship, but in which the pagan was more prominent than the moral element. According to Sainte-Beuve, "no French poet or painter has rendered so well the feeling for nature—the feeling not so much for details as for the *ensemble* and the divine universality, the feeling for the origin of things and the sovereign principle of life."

The name of EUGÉNIE DE GUÉRIN (1805-1848), the

sister of Maurice, cannot be omitted from any notice of him, if only on account of the ties of love that united them; but her *Journals*, published in 1861, English translation 1865, and her *Lettres*, published in 1864, English translation 1865, indicated the possession of gifts of as rare an order as those of her brother, though of a somewhat different kind. In her case mysticism assumed a form more strictly religious, and she continued to mourn her brother's loss of his early Catholic faith. Five years older than he, she cherished a love for him which was blended with a somewhat motherly anxiety. In him she centred her chief earthly hopes, and after his death her only remaining earthly purpose was to rescue his name from oblivion by the collection and publication of the scattered fragments of his writings. She died, however, on the 31st May 1848, before her task was completed.

See the notices by George Sand and Sainte-Beuve referred to above; Sainte-Beuve, *Causeries du lundi*, vol. xii., and *Nouveaux lundis*, vol. iii.; G. Merlet, *Causeries sur les femmes et les livres*, Paris, 1865; Selden, *L'Esprit des femmes de notre temps*, Paris, 1864; Marelle, *Eugénie et Maurice de Guérin*, Berlin, 1869; Harriet Parr, *M. and E. de Guérin, a monograph*, London, 1870; and Matthew Arnold's essays on Maurice and Eugénie de Guérin, in his *Essays in Criticism*.

GUÉRIN, JEAN BAPTISTE PAULIN (1783-1855), French painter, belongs to the group who specially represent the Restoration. Born at Toulon, on the 25th March 1783, of poor parents, he learnt, as a lad, his father's trade of a locksmith, whilst, at the same time, he followed the classes of the free school of art. Having sold some copies to a local amateur, Guérin started for Paris, where he came under the notice of Vincent, whose counsels were of material service. In 1810 Guérin made his first appearance at the Salon with some portraits, which had a certain success. In 1812 he exhibited Cain after the murder of Abel (formerly in Luxembourg), and, on the return of the Bourbons, was much employed in works of restoration and decoration at Versailles. His Dead Christ (Cathedral, Baltimore) obtained a medal in 1817, and this success was followed up by a long series of works, of which the following are the more noteworthy:—Christ on the knees of the Virgin, 1819; Anchises and Venus, 1822 (formerly in Luxembourg); Ulysses and Minerva, 1824 (Musée de Rennes); the Holy Family, 1829 (Cathedral, Toulon); and Saint Catherine, 1838 (St Roch). In his treatment of subject, Guérin attempted to realize rococo graces of conception, the liveliness of which was lost in the strenuous effort to be correct. His chief successes were attained by portraits, and those of Charles Nodier and the Abbé Lamennais became widely popular. Guérin died January 19, 1855. We possess no account of his life and works beyond that which is afforded by brief notices in contemporary biographical dictionaries.

GUÉRIN, PIERRE NARCISSE (1774-1833), French painter, was born at Paris, May 13, 1774. The artistic ideal of the first empire found complete expression in his work, the most famous examples of which show a peculiar combination of the dry pseudo-classic style, then popular, with tragic pathos of a highly exaggerated character; yet from his atelier went forth, as if in necessary protest against the defects of their master, the leaders of the Romantic and Realistic movements,—Delacroix and Géricault. The first teacher of Guérin was Nicolas Brenet, whom he left to place himself under Jean Baptiste Regnault, the representative, as contrasted with David, of a distinct form of the classic reaction—modified by a tincture of Italian tradition. Guérin became the most distinguished of his pupils, and carried off one of the three "grands prix" offered in 1796, in consequence of the competition not having taken place since 1793. The pension was not indeed re-established, but Guérin fulfilled at Paris the conditions imposed upon a *pensionnaire*.

and produced various works, one of which brought him prominently before the public. This work, *Marcus Sextus* (Louvre), exhibited at the Salon of 1799, excited wild enthusiasm, partly due to the subject—a victim of Sulla's proscription returning to Rome to find his wife dead and his house in mourning—in which an allusion was found to the actual situation of the *émigrés*. Guérin on this occasion was publicly crowned by the president of the Institute, and before his departure for Rome (on the re-establishment of the *École* under *Suvée*) a banquet was given to him by the most distinguished artists of Paris. In 1800, unable to remain in Rome on account of his health, he went to Naples, where he painted the *Grave of Amyntas*. In 1802 Guérin produced *Phædra* and *Hippolytus* (Louvre); in 1810, after his return to Paris, he again achieved a great success with *Andromache* and *Pyrrhus* (Louvre); and in the same year also exhibited *Cephalus* and *Aurora* (Collection *Sommariva*) and *Bonaparte and the Rebels of Cairo* (Versailles). The Restoration brought to Guérin fresh honours; he had received from the first consul in 1803 the cross of the legion of honour, and in 1815 Louis XVIII. named him Academician. The success of Guérin's *Hippolytus*, of *Andromache*, of *Phædra*, and of *Clytæmnestra* (Louvre) had been ensured by the skilful selection of highly melodramatic situations, treated with the strained and pompous dignity proper to the art of the first empire; in *Aeneas* relating to *Dido* the disasters of Troy (Louvre), which appeared side by side with *Clytæmnestra* at the Salon of 1817, the influence of the Restoration is plainly to be traced. In this work Guérin sought to captivate the public by an appeal to those sensuous charms which he had previously rejected, and by the introduction of picturesque elements of interest which, even now, distract attention from the artificial mannerism too painfully apparent in his treatment of tragic subject. But with this work Guérin's public successes came to a close. He was, indeed, commissioned to paint for the *Madeleine* a scene from the history of *St Louis*, but his health prevented him from accomplishing what he had begun, and in 1822 he accepted the post of director of the *École de Rome*, which in 1816 he had refused. On returning to Paris in 1828, Guérin, who had previously been made chevalier of the order of *St Michel*, was ennobled. He now attempted to complete *Pyrrhus* and *Priam*, a work which he had begun at Rome, but in vain; his health had finally broken down, and in the hope of improvement he returned to Italy with *Horace Vernet*. Shortly after his arrival at Rome *Baron Guérin* died, on July 6, 1833, and was buried in the church of *La Trinità de' Monti* by the side of *Claude Lorraine*. A careful analysis and criticism of his principal works will be found in *Meyer's Geschichte der Französischen Malerei*, but his life has not yet been made the subject of special treatment.

GUERNSEY, the second in size of the Channel Islands, is situated between 49° 25' and 49° 31' N. lat. and between 2° 30' and 2° 41' W. long., 30 miles W. of Normandy, and 51 miles S. of Portsmouth. The total area at low water is estimated at 15,560 acres, or rather more than 24 square miles, and of this about 10,000 acres are under cultivation. Gradually rising from the north to the south, the island attains its maximum elevation of 349 feet above mean tide at *Haut Nez*, above *Point leart*. According to *J. A. Bird's "Geology of the Channel Islands"* in *The Geological Magazine*, London, 1878, it consists geologically of three very unequal portions, one characterized by a very felspathic syenite and gneiss, another by a hornblende "granital," and a third by a micaceous syenite. The felspathic portion yields magnificent crystals of feldspar, surpassing those of the porphyritic granites of Cornwall or Cumberland; and the hornblende portion occasionally affords crystals of black hornblende in similar perfection. No

Secondary or Tertiary rocks are found in position, but post-Tertiary clays containing flints are found all round the island and even on its summit, and *Mr Bird* is disposed to assign them to the interglacial period of submergence. The soil of Guernsey is generally a light sandy loam, and the subsoil consists for the most part of angular gravel, except in certain places occupied by a curious clay, chiefly composed of a silicate of alumina, which proves destructive to vegetable life. While the island does not grow sufficient grain for its own consumption, it has a large export of fruits and other garden produce. Parsnips were formerly one of the principal items, but they are now less extensively cultivated, having been supplanted by potatoes and turnips. Grapes, which were exported to the amount of 50 tons in 1873, are the source of an increasing trade. Granite is largely shipped at *St Sampson*.

For administrative purposes Guernsey is united with *Alderney*, *Sark*, *Herm*, and the adjacent islands in the bailiwick of Guernsey. The island proper is divided into the ten parishes of *St Peter Port*, *St Sampson*, *Vale*, *Câtel*, *St Saviour*, *St Andrew*, *St Martin*, *Forest*, *St Peter du Bois*, and *Torteval*. The administration is under the supervision of a lieutenant-governor appointed by the crown; and the parliamentary assembly consists of a bailiff, twelve jurats, a procureur or attorney-general, the benefited clergy, and twelve delegates elected by the people. Taxation is very light, and the annual revenue amounts to about £10,000. Ecclesiastically the island is a deanery of the Winchester diocese of the Church of England.

The only town of any great importance is *St Peter Port* on the eastern coast. In 1861 it had a population of 16,388 (6968 males and 9420 females), and in 1871, 16,166 (6731 males and 9435 females). The sea frontage of the town extends for about a mile, and is protected in nearly all its length by a wall with an esplanade. On the improvement of the harbour, which was begun in the 13th century by order of *King Edward I.*, a sum of £285,000 has been expended since 1854. It is formed by two piers, which enclose an area of 73 acres, the southernmost of the two running out to *Castle Cornet* and then sending out a breakwater for about 3000 yards. The whole of the works are of the most massive description. Among the principal buildings of the town, which has been greatly improved by the formation of a new street from the harbour up to the hill, are the Government house, the court-house, *Elizabeth college*, the town hospital, *St Stephen's church* built in 1866, the Roman Catholic church designed by *Pugin*, and the new vegetable market constructed at a cost of £16,000. On the higher ground above the town is a monument in memory of the *Queen's visit* to the island in 1816, and on the pier there was erected in 1863 a monument to the *Prince Consort* by *Mr Durham*, a copy of the monument in the gardens of the Horticultural Society at *South Kensington*. *St Sampson*, which is the only port besides *St Peter Port*, is situated at the eastern end of the *Braye du Val*, a depression which at no distant date used to form an arm of the sea at high tides, cutting the island into two unequal parts. The harbour accommodation has been improved at *St Sampson* contemporaneously with that of *St Peter Port*. To the south of the latter is the strong fort of *St George's* with barracks for 5000 men, and smaller forts, batteries, and martello towers are to be found on suitable points all round the coast.

By the old Guernsey laws, all the male population from sixteen to sixty are obliged to serve in the militia; but the custom of paying exemption fines has gradually become so common that the real force is very far below its nominal limit. Guernsey is both populous and wealthy, and the wealth is very evenly distributed among the people. In 1873 the assessment value of the town parish was

£3,564,750, or £2262 per head, and that of the rural parishes £1,831,620, or £1233 per head. Like the neighbouring part of France, Guernsey still possesses numerous traces of its early inhabitants, in the form of sepulchral caves, dolmens, and maenhirs. The most remarkable group of the second class is in the north at Anresse. Details will be found in Mr Lukis's paper in vol. i. of the *Archæological Journal*, and in vols. i. and viii. of the *Journal of the Archæological Association*, as well as in the special chapter in Dr Ansted's *Channel Islands*. The island is usually identified with the Sarnia of the latter Roman writers. Its present name would appear to be a corruption of the Norse for Green Isle. For details on its history see CHANNEL ISLANDS. An account of a number of its more eminent natives, many of whom have served with high distinction in the British army, will be found in *Sarnia, or brief Memorials of many of her Sons*, Guernsey, 1862. Among the better known families are the Saumarezes, the Tupperes, and the Careys.

Besides the works referred to under CHANNEL ISLANDS, see *Documents relatifs à l'île de Guernsey*, Guernsey, 1814; *Views of Guernsey*, with descriptive letterpress, Edinburgh, 1867; John Jacob, *Annals of the Bailiwick of Guernsey*, London, 1830; Le Marchant, *Laws and Customs of Normandy as used in Royal Court of Guernsey*.

GUERRAZZI, FRANCESCO DOMENICO (1804-1873), Italian writer and politician, was born at Leghorn, August 12, 1804. He studied law at Pisa, and happened to become acquainted there with Byron, who produced a very strong impression on his lively imagination. Having taken his degree in law, he went back to Leghorn to practise his profession, but engaged at the same time in literary pursuits. In 1827 he published his first novel, *The Battle of Benevento*, a work displaying powerful imagination and strong patriotic feeling. While exiled in 1834 to Portoferraio, on the island of Elba, he wrote *Isabella Orsini* and *The Siege of Florence*, the latter producing great enthusiasm in Italy. The two compositions which followed, *Veronica Cibo* and *The New Tartufes*, are of inferior value. In 1844 Guerrazzi was again exiled to Portoferraio. When the revolution broke out in 1848, he was named deputy, then president of the counsel of ministers, and finally, in the beginning of 1849, along with Montanelli and Mazzoni, triumvir and dictator of Tuscany. He had to expiate these few months of power by years of imprisonment and exile. He was banished first to Corsica, where he wrote *Beatrice Cenci*, *The Tower of Nonza*, and *Fides*; and then to Genoa, where he composed the *Memento Homo*, *The Hole in the Wall*, *Messer Arlotto Mainardi*, *Paolo Pellicione*, *The Italian Plutarch*, *The Lives of Andrea Doria*, *Francesco Ferruccio*, *Pasquale Paoli*, *The Siege of Rome*, and *The Ass (L'Asino)*, a humorous work. When the kingdom of Italy was constituted, Guerrazzi was several times sent to parliament as deputy. Towards the end of his life he withdrew to a villa he had on the sea-shore, near Cecina, not far from Leghorn, where he wrote his novel entitled *The Dying Century*. He died there on the 25th September 1873, and was buried in the church of Montenero, near Leghorn. His letters are being collected for publication under the direction of the poet Joseph Carducci.

See Guerrazzi's own *Apology*, Florence, 1851; Bosio, *F. D. Guerrazzi and his Works*; De Gubernatis, *Ricordi Biografici*, Florence, 1873; and Corona, *F. D. Guerrazzi*, Biella, 1873.

GUERRERO, formerly TIXTLA, the chief town of the state of Guerrero, Mexico, is situated at an elevation of about 5000 feet in a narrow and unhealthy valley in the Sierra Madre, 28 miles from the coast and 150 miles S.W. of Mexico. Mining is carried on, but not to any great extent, and coarse cloth is manufactured. The population in 1869 was 6501.

GUESCLIN. See DU GUESCLIN.

GUEVARA, ANTONIO DE (c. 1490-1545), Spanish chronicler and moralist, was a native of the province of Alava, and passed some of his earlier years at the court of Queen Isabella. In 1528 he entered the Franciscan order, and he afterwards accompanied Charles V. during his journeys and residencies in Italy and in other parts of Europe. After having held successively the offices of court preacher, court historiographer, bishop of Guadix, and bishop of Mondoñedo, he died in 1545. His earliest work, entitled *Relox de principes, o Marco Aurelio*, published in 1529, and, according to its author, the fruit of eleven years' labour, is a kind of romance designed, after the manner of Xenophon's *Cyropædia*, to delineate in a somewhat ideal way for the benefit of modern sovereigns the life and character of an ancient prince distinguished for wisdom and virtue. It was very often reprinted in Spanish; and before the close of the century had also been translated into Latin, Italian, French, and English. It is difficult now to account for its extraordinary popularity,—its thought being neither just nor profound, while its style is stiff and affected. It gave rise to a literary controversy, however, of great bitterness and violence, the author having ventured without warrant to claim for it an historical character, appealing to an imaginary "manuscript in Florence." Other works of Guevara are the *Decada de los Césares*, or "Lives of the Ten Roman Emperors," in imitation of the manner of Plutarch and Suetonius; and the *Epistolas Familiares*, sometimes called "The Golden Epistles," often printed in Spain, and translated into all the principal languages of Europe. They are in reality a collection of stiff and formal essays which have long ago fallen into merited oblivion (see Ticknor, *Hist. of Span. Lit.*; vol. ii.).

In Spanish literature occurs also the name of LUIS VELEZ DE GUEVARA (1570-1644), who is said to have written nearly 400 comedies, of which however only a few, and these of little value, have been preserved. This Guevara is chiefly noteworthy as having been the author of a prose romance entitled *El Diablo Cojuelo*, which suggested to Le Sage the ideas and materials of his *Diable Boiteux*.

GUGLIELMI. There are several Italian musicians of this name, the most celebrated of them being Pietro, born at Massa Carrara in May 1727. He received his first musical education from his father, and afterwards studied under Durante at the Conservatorio di San Loretto, Naples. His first operatic work was produced at Turin in 1755, and the success was such as falls to the lot of few primary efforts. Guglielmi's reputation was thenceforth established, and soon his fame spread beyond the limits of his own country, so that in 1762 he was called to Dresden to conduct the celebrated opera there. He remained for some years in Germany, where his works met with much success, but the greatest triumphs were reserved for him in England. He went to London in 1772, and stayed there five years, returning to Naples in 1777. He still continued to produce operas at an astounding rate, but was unable to compete successfully with the younger masters of the day. In 1793 he became maestro di capella at St Peter's Cathedral, and died at Rome, November 19, 1804. He was a very prolific composer, and occupies a respectable if not absolutely first-rate position among the earlier masters of Italian comic opera. There is indeed in most of his scores a vein of humour and natural gaiety not surpassed by Cimarosa himself. In serious opera he was less successful. But here also he betrays at least the qualities of a competent musician. Considering the enormous number of his works, his unequal workmanship and the frequent instances of mechanical and slipshod writing in his music need not surprise us. The following are among the most celebrated of his operas:—*I due gemelli*, *La serva inamorata*, *La pastorella nobile*, *La*

beta peccatrice, Rinaldo, Artusesse, Didone, and Eneo e Lavinia. He also wrote oratorios and miscellaneous pieces of orchestral and chamber music. Of his eight sons two at least acquired fame as musicians—Pietro Carlo (1763–1817), a successful imitator of his father's operatic style, and Giacomo, an excellent singer.

GUIANA, GUYANA, or GUAYANA, an extensive territory in the north-eastern part of South America, comprehending in its widest acceptation all the extent of country lying between the rivers Amazon and Orinoco from 3° 30' S. to 8° 40' N. lat., and from 50° 22' to 68° 10' W. long. It is bounded on the N. by the Orinoco and the Atlantic, E. by the Atlantic, S. by the rivers Negro and Amazon, and W. by the Orinoco and the Cassiquiare. Its greatest length from east to west is about 1200 miles, its greatest breadth, from the mouth of the Orinoco to the confluence of the Rio Negro with the Amazon, about 800 miles; and the estimated area is 690,000 square miles. This vast territory is divided into Brazilian (formerly Portuguese) Guiana, Venezuelan (formerly Spanish) Guiana, and Colonial Guiana. The first two divisions, comprising about five-sixths of the entire region, are claimed by or included in Brazil and Venezuela respectively; and stretching eastward from the mouth of the Orinoco towards that of the Amazon lie the territories of British, Dutch, and French Guiana, which are in that order noticed below.

Columbus in 1498 decided that the Orinoco must flow through some vast continent. Vincent Yanez Pinzon, a Spanish navigator, is believed to have first sailed up the Amazon from the coast. Vasco Nuñez landed on the coast of Guiana in 1504, but the discovery is also claimed for Diego de Ordaz, one of the captains of Cortez in the conquest of Mexico in 1531. Sir Walter Raleigh ascended the Orinoco in 1595 in search of the El Dorado. The first settlement is stated to be that of some Dutch people in 1580 near the river Pomeroon. This possession was contested by the Spaniards, but in 1613 a colony of Zealanders on the banks of the Essequibo was reported in a flourishing condition. English and subsequently French colonization was attempted up the Surinam river. The English returned in 1652 to Paramaribo, and in 1662 the whole colony was granted by Charles II. to Lord Willoughby. In 1669, however, Dutch Guiana covered all the territory now divided into British, Dutch, and French. In 1712 the French attacked the settlement and exacted a contribution. In 1732 Berbice received a constitution

from the states-general, and in 1763 there was a formidable insurrection of negro slaves who had been introduced from Africa. In 1781 Rodney took possession; and though the colonies were restored to Holland in 1783, they surrendered again to the British in 1796. The Dutch resumed authority in 1802, and in 1803 the proper history of British Guiana began.

I. BRITISH GUIANA, when finally acquired in 1803, and formally ceded in 1814, consisted of the three colonies, Demerara, Essequibo, and Berbice, so named after the principal rivers which drain them. These were consolidated into one colony in July 1831. It is bounded on the N. and N.E. by the Atlantic, E. by Dutch Guiana, from which it is separated by the river Corantyn, S. by Brazil, and W. by Venezuela. It lies between 0° 40' and 8° 40' N. lat., and 57° and 61° W. long., and has an estimated area of 76,000 square miles, but the boundaries are still disputed by Venezuela and Brazil. An engagement, however, exists between the British and Venezuelan Governments that neither shall occupy territory claimed by both. The colony has now three divisions, called counties:—Berbice, extending from the Corantyn about 95 miles along the sea-coast; Demerara, from the Abari about 65 miles, including Georgetown, the capital; and Essequibo, from the river of that name about 120 miles to the Barima near the Orinoco mouth. There is thus a length of coast of 280 miles, with an extent inland varying from 300 to 450 miles.

Surface.—From the coast-line seaward the ocean deepens very gradually, and at low tide extensive mud-flats and sandbanks are left bare. Traced inland, this fluvio-marine deposit is found to rise to 10 or 12 feet above high-water mark, and to end at an older deposit of sand and clay beds, which forms an extensive undulating country, rising to not more than 150 feet above the sea, and stretching back to where the solid rock strata underlying it crop out. Upon the rich alluvial soil of the depressed coast-land, and for a few miles up the rivers, the sugar estates are situated. They are not only protected by dams from the sea, but, as in wet weather water rapidly accumulates in the savannahs behind, they are similarly defended on that side also. A narrow sand reef, some little distance farther inland, running parallel with the coast-line, marks a previous sea limit, and still farther back a higher range of coarse white sand probably marks a yet earlier coast. The eastern portion of the colony from the sources of the Corantyn and Essequibo is a rough inclined plane, sloping down to the sea-level from a height of about 800 feet, the most elevated part being mountainous and rising to 2000 feet above the sea. This plain extends westward and northward, broken by ranges of mountains, its western portion constituting part of the extensive savannah which stretches eastward from Brazil. Two great parallel mountain systems cross the colony from west to east, the greater being that of the Pacaraima and Merumé mountains, and the lesser including the Canucu, Cumucumu, and Coratamung mountains, while the Sierra Acarai, a densely wooded chain rising to 2500 feet, forms the southern boundary of Guiana and the watershed between the Essequibo and the tributaries of the Amazon. The Pacaraima mountains, a wide extent of rough country traversed by broad valleys, extend from about 4° to 6° 30' N. lat., and rise to 3000 feet between the Potaro and Siparuni rivers, and to 7500 feet at Roraima mountain, which rises, a perpendicular inaccessible wall of red sandstone, at the extreme western limits of the colony. The southern portion of Pacaraima shows rugged hills and valleys strewn with rocks, but to the north, where the sandstone assumes table-shaped forms, there are dense forests, and the scenery is of extraordinary grandeur. The Imataca range lies between the Cuyuni and Barima

rivers in 7° to 8° N. lat. A sandstone formation can be traced from the northern Pacaraima mountains on the west to the Corantyn on the east. Interbedded with it are three great layers of greenstone. The surface of a very large portion of the colony is composed of gneiss, which is seen in large rounded bosses in the river beds. Schist of different kinds is associated with gneiss in many localities. Quartz-porphry and felstone occupy extensive areas over the surface of the granite and underlying the gneiss. A large proportion of the surface rock in the interior is granite. The white sand at the sandhills on the Demerara and elsewhere is very pure and well-adapted for glass-making. Gold has been found about 40 miles up the Cuyuni river. Attempts to work it have met with small success, and have been complicated with questions of boundary.

Rivers.—The colony is traversed by numerous large rivers, the principal being the Essequibo, Corantyn, Mazaruni, Cuyuni, Berbice, and Demerara. The Corantyn forms the boundary between British and Dutch Guiana. It rises in 2° N. lat., 100 miles eastward of the Essequibo, flows generally northward, and falls into the Atlantic by a broad estuary in 6° N. lat., 57° W. long. It is navigable for small vessels for 150 miles from its mouth, and is remarkable for its magnificent cataracts. The Cuyuni, coming from Venezuela, runs a course of 120 miles through territory claimed as British. The Essequibo rises in the Sierra Acarai, 0° 40' N. lat., and after a course of at least 600 miles discharges itself into the ocean by an estuary 15 miles in width, in 7° N. lat., 58° 40' W. long. In this estuary are a group of islands where sugar is grown, several being from 12 to 15 miles long and 3 miles broad. The principal are Hog Island, Wakenaam, and Leguan; a smaller one is named Tiger Island. The entrance of the Essequibo is difficult owing to deposits of mud and sand. Its course lies through forests of gigantic vegetation. About 43 miles from its mouth it is joined by the Mazaruni, which is itself joined by the Cuyuni at 8 miles from its mouth. The cataracts, of which one of the greatest is the King William's Cataract of Schomburgk, in 3° 14' 35" N. lat., put a stop to the navigation of the Essequibo by large vessels about 50 miles up. In 3° 57' 30" N. lat. and 58° 3' W. long. it receives the Rupunui, which has a course of 220 miles. Another large tributary is the Potaro, upon which is the celebrated Kaieteur (Old Man's) Fall, so named from an Indian legend, and discovered on April 24, 1870, by Mr C. B. Brown of the Geological Survey, who, owing to cataracts, took a fortnight to reach the fall from the coast up the Essequibo and Potaro. This fall, in 5° 8' N. lat. and 59° 19' W. long., is produced by the river flowing over a sandstone and conglomerate table-land 822 feet into a deep valley below. For the first 741 feet the water falls perpendicularly, as one great continuous whitish column, circled by rainbows, into a basin below, continuing thence over a sloping cataract 88 feet in height, and through the interstices of great blocks of rock, to the river-bed below. The head of the fall is 1130 feet above the sea. The river 200 yards above the fall is 400 feet wide, and the width of the fall itself varies, according to the season, from 240 to 370 feet. The Demerara or Demerary rises probably near 5° N. lat., and after a northward course nearly parallel with the Essequibo for more than 200 miles, enters the Atlantic near 6° 50' N. lat. and 58° 20' W. long. It is navigable for 85 miles, and at its mouth at Georgetown is 1½ miles across. A bar, or deposit of mud and sand, prevents the entrance of large vessels at low tide. Farther east is the Berbice, whose source is probably about 3° 40' N. lat. It is 2½ miles wide at its mouth in 6° 21' N. lat., 57° 12' W. long., and is navigable for 175 miles by vessels drawing 7 feet of water. The Canje creek falls into the Berbice near its mouth. Several large streams called creeks fall

directly into the Atlantic between the Berbice and the Demerara. The Boerasiri creek divides the counties of Demerara and Essequibo, and between the Essequibo and the Barima are the rivers or creeks Pomeroon, Morucca, and Waini.

Climate.—The climate, especially in the interior, is healthy. The even temperature is considered suitable for pulmonary complaints; and tubercular consumption is unknown. There are no hurricanes, and gales are not frequent. Occasionally there is a long drought, but the following order of seasons is generally maintained. From the middle of April to June there is a long season of heavy rains, which decrease in July; the long dry season lasts from August to November; December and January comprise the short rainy season, and February and March the short dry season. The winds during the rains are generally westerly. In the dry seasons they blow from the ocean and modify the heat. The thermometer seldom rises above 90° or falls below 75° Fahr. At Georgetown the mean annual temperature is 81° 2'. The rainfall in 1878 was 69.94 inches, the average having been 74 inches for 1873-77.

Population.—The census of 1871 was as follows:—113,570 born in British Guiana (including 70,000 to 80,000 negroes, 10,000 born of Indian and Chinese parents, and the "coloured" population), 42,681 immigrants from India, 6295 Chinese, 7925 from Madeira and Azores, 13,385 negroes from West-Indian Islands, and 9635 Europeans and others; total 193,491, exclusive of aborigines, estimated at 7000. The estimated total population on 31st December 1876 was 225,365, and further explorations have increased the estimated number of aboriginal Indians. The aborigines are remnants of Indian tribes, such as the Arawaks, Warraus, Caribs, and many others, scattered in the interior of the country. They maintain themselves by fishing and hunting. Traces of "Indian picture-writing" or sculptured figures, have been found in some granite blocks up the Essequibo. On December 31, 1877, 22,500 East Indian immigrants were working under a five years' indenture on the estates, and 26,000 not under indenture. Since 1857, 10,315 East Indian coolies (including women and children), with savings amounting to £260,479, have availed themselves of their right to return passage. A number re-emigrate to the colony. The Indian Government supervises the emigration. In the colony an immigration department regulates labour, wages, and general treatment. About 5000 are now annually introduced. Chinese have also been introduced with and without indenture.

Vegetation.—The vegetation is most luxuriant. The interior affords an exhaustless supply of valuable timber, such as the mora and greenheart, largely used for shipbuilding. The climate insures a continuous succession of tropical flowers and fruits. Many of the trees yield gums, febrifuges, oils, and juices of more or less value, among which may be mentioned caoutchouc, and a gum called "balata," with properties intermediate between those of caoutchouc and gutta percha. The bark of the crab tree is used for tanning. The silk-cotton tree, which grows 100 feet high and 12 feet round, yields a light-grey silky cotton used for stuffing pillows. Among the palm-trees are the picturesque mountain cabbage palm, growing to the height of 100 feet, the cocoa-nut palm; the sago palm; the eta palm, much esteemed for its beauty and fruit; and the cockarite palm, which produces the most delicate cabbage of all the palm species. The mangrove tree, 15 to 20 feet high, skirts the sea-coast. The tobacco plant grows wild, and indigenous cottons are numerous. A little rice is grown. The fruit of the plantain and banana is largely used for food, and the stems furnish fibre for paper-making. Orange, lime, guava, cashew, and pine-apple are among the fruits. Indigo used to be cultivated. Arnotte, from which the well-known dye is obtained, is indigenous; and logwood and vanilla are also found. Maize, cassava, yams, papaw tree fruit, sweet potatoes, peppers, and other productions are valuable for food or medicine. The largest of the water lilies, the *Victoria regia*, was first discovered in Guiana.

Animals.—Among the wild animals are the tapir or bush cow, the manatec (the flesh of which is sometimes eaten), the jaguar or "tiger." Three kinds of ant-bear the sloth, opossum, armadillo,

acouri (or hare), numerous monkeys, and vampires, measuring 30 inches from point to point of extended wing. The cayman, alligator, or crocodile of South America, 15 to 20 feet long, abounds in the rivers and canals. Among other reptiles are the iguana (the flesh of which is said to be suitable for eating), many lizards, and snakes (some venomous). Tortoises and turtles are common on the banks of the streams and in sandy districts of the coast. The bird, insect, and fish life of Guiana is of indescribable richness and variety.

Produce, Industries, and Commerce.—There are 120 sugar and 12 small coffee estates in the colony. Cotton was formerly exported, but the cultivation has now ceased. Coffee, the export of which in 1830 was 9½ million lb, is not now produced for the foreign market. The deep rich soil has induced large investments in the formation of sugar estates; but the industry has undergone great fluctuations. Exports in 1839, when negro apprenticeship terminated, fell from an average of 66,000 to 38,443 hhds. The equalization of the English duties on free and slave-grown sugar still further restricted cultivation, exports in 1849 being only 32,000 hhds. In 1854 matters had begun to mend. The prospect of obtaining coolie labourers from India and China caused new capital to be introduced and fresh energy employed. Cultivation was improved and extended, vacuum pans came to be more used, steam ploughs and tile draining were successfully introduced. The value of machinery imported from 1867 to 1876 was £850,000. A quantity of 2 to 3 hhds. (of about 17 cwts.) per acre is often obtained, but the average is 30 cwts. The juice expressed by the powerful rollers is about 60 per cent. of the weight of canes. The "Demarara crystals" are very popular for their purity and saccharine strength, and command high prices. The sugar exports in 1876 were 119,891 hhds., fully equal to 100,000 tons; in 1877, 111,156 hhds.; and in 1878 (a year with prolonged drought), 86,075 hhds. Nearly all this last quantity went to the United Kingdom, but 20,000 and 92,000 hhds. went to the United States in 1876 and 1877 respectively. The rum exported in 1876 was 36,000 puncheons; in 1877 it was 32,531, and in 1878 28,752. The quantity of rum issued for consumption in the colony in 1878 was 330,392 gallons. The export of molasses (of which less is made as the quality of the sugar improves) is principally to the United States and British provinces, the quantity being 14,320, 19,862, and 17,084 casks in 1876, 1877, 1878. The same years the timber exports (nearly all to the United Kingdom) were 464,436, 357,430, and 303,693 cubic feet. The woodcutting industry, under Government licence, is a considerable one, as is shown by the export of about 5 million shingles annually. Up the rivers and creeks charcoal-burning is carried on; 32,266, 35,631, and 46,746 barrels of charcoal were exported in 1876, 1877, 1878. There are 1,250,000 cocoa-nuts exported yearly. In 1853 the total value of imports was £847,183; in 1877, £2,229,908 (£1,079,898 from the United Kingdom); in 1878, £2,150,714. The exports were in 1853, £1,014,944; in 1877, £3,049,157 (£1,954,766 to the United Kingdom); and in 1878, £2,507,571. The tonnage, inwards and outwards, was 234,039 tons in 1853, and 519,986 tons in 1877.

Government.—The government is vested in a governor appointed by the British crown and a court of policy, originally instituted by the Dutch in 1773 for Demerara, and including Essequibo in 1789. Berbice had until 1831 a separate constitution. The unofficial members of the court were elected by a college of kiezlers or electors, who were themselves elected by duly qualified inhabitants. In 1795 this college commissioned some of their own members to act with the court of policy in financial matters. This resulted in an independent body, called financial representatives, being elected by the inhabitants who were qualified to vote for kiezlers. The financial representatives and the court of policy meet in annual session as the "combined court," to discuss finance and pass the annual tax ordinance. The civil list is not permanent, being renewed every seven years. All other ordinances or local laws are passed by the court of policy,—every ordinance being subject to confirmation by the queen. The colony is divided into five electoral districts, with a total of 863 registered electors. These districts elect for life one or two kiezlers, seven in all, and one or two financial representatives, six in all. When a vacancy occurs in the court of policy the seven kiezlers nominate two persons, one of whom is selected by the court. There are five unofficial members chosen as above, and five official members, viz., the governor, attorney-general, Government secretary, auditor-general, and immigration agent-general. The public revenue in 1853 was £250,017, and the expenditure £236,557. In 1877 the revenue was £389,872, and in 1878 £405,092. Half of this revenue is derived from import duties, and the remainder principally from wine and spirit duties, rum duty, and retail spirit licences. The expenditure in 1877 was £380,566, and in 1878 £417,995. The public debt in 1877 was £323,563. Public and mercantile accounts are kept in dollars (4s. 2d. sterling) and cents.

The Roman Dutch law is in force in civil cases, modified by orders in council and local ordinances; the criminal law is based on that of Great Britain, and administered in the same way, except that there is no grand jury. The supreme court consists of the chief justice and two puisne judges. Appeal in cases involving

£500 and upwards lies to the privy council. There are an inferior court of civil justice, courts of admiralty and vice-admiralty, of petty debt (conducted by stipendiary magistrates), of bail and review (of magistrates' decisions). One judge sits in the supreme criminal court; and there is an inferior criminal court. Questions of law are decided by three judges in the court of crown cases reserved. Besides a police magistrate for Georgetown, there are thirteen districts, each with a stipendiary magistrate appointed by the secretary of state.

Towns.—For a notice of GEORGETOWN, the capital (resident population about 40,000); see vol. x. p. 430. The lighthouse, with revolving light visible for many miles, is at the north end, near the mouth of the river. The lightship is 11 miles off in 6° 56' N. lat. and 58° 13' W. long. The chief town of Berbice is New Amsterdam, on the east bank of the Berbice river. It is well laid out, and has a population of 6000. The Berbice lightship is in 6° 29' 10" N. lat. and 57° 23' 40" W. long.

Religion and Education.—The diocese of Guiana was established in 1842. The official list shows—1 bishop, 1 archdeacon, 10 rectors, 14 curates, 2 incumbents, and several missionary clergymen and chaplains to institutions. The Church of England has 69 churches or chapels. The Coolie Mission Association and Diocesan Society maintain missionaries and catechists. The Church of England claims 90,000 members. The Church of Scotland has 10 ministers. The Roman Catholics also have several churches and mission stations. The Church of England receives an annual grant of £10,000 from the public revenue, the bishop's salary (£2000) being paid from imperial funds; the Church of Scotland has £5000, and the Roman Catholic Church £2500 from public revenue. There are also 14 Wesleyan Methodist ministers, a Moravian mission, and several chapels of Congregational Dissenters and others belonging to the London Missionary Society. The system of education supported by the general revenue is denominational. There are 177 schools sanctioned by the board of education. The estimate for primary education in 1879 was £29,695. The Church of England has 81 schools, exclusive of those on estates for coolies.

Sawkins, "On Geology of British Guiana" in *Quarterly Journ. of Geol. Soc.*, London, 1871; Brown's *Canoe and Camp Life in British Guiana*, 1876; Brett's *Indian Tribes of Guiana*, 1876; *Colonial Office List*; *British Guiana Directory*; Bennet's *British Guiana*; Boddam-Whetham's *Roraima*, 1879. (J. L. O.)

II. DUTCH GUIANA, or SURINAM, lies to the E. of British Guiana, from which it is separated by the Corantijn or Corantyn in 57° 5' W. long. Its coast extends for upwards of 220 miles to the mouth of the Maroni or Marowijne, which forms the boundary towards French Guiana. The Dutch claim possession of 58,530 square miles; but of this extensive area, equal to more than four times that of Holland, not more than 3230, according to Wolbers, had been explored in 1868, the colonial territory did not comprise more than 640 square miles, and the actual area under cultivation was little over 200. In 1875 this last was 29,852 acres (47 square miles), and in 1876, 22,180. The principal settlements have been made in the lower valley of the Surinam, or between that river and the Saramacca on the W. and the Commewijne on the E. At its mouth the Surinam is 3 miles broad, and at Paramaribo, the capital, about half a mile. Ships of from 18 to 19 feet of draught can reach the anchorage in front of the town, which has room for 100 vessels. The water is of a dirty yellow colour with brown bubbles on its surface, and its current can be traced far out at sea. As yet no one has seen the source of the Surinam, but it is understood to be high up in the Tumac Humac hills. The principal tributaries are the navigable Para on the left hand and the Paulus Creek on the right, both of which join it about 6 or 7 miles above Paramaribo.¹ The Marowijne or Marouï is a much larger river than the Surinam. Its water is clear as crystal, so that stones can be distinguished at a depth of 12 feet. Unfortunately its mouth, though about 4 miles broad, is full of sand-banks, and consequently it has been less visited than might have been expected from the excellent character of the country through which it flows. The banks are high

¹ An interesting account of a voyage up the Surinam by Zinnemann, with a good map on a large scale, will be found in *Tijdschrift van het Aardrijkskundig Genootschap*, 1877.

enough to confine the floods, though at Arminia, about 45 miles inland, the difference of level between the dry and the rainy season is 23 feet. Between the rivers of Dutch Guiana there are remarkable cross channels available during the floods at least. The Maroni is even connected with the Corantyn on the one hand (though there is 200 miles of country between) and with the Oyapock on the other. As it communicates with the Cottika, which is in turn a tributary of the Commewijne, a boat can pass from the Maroni to Paramaribo; thence by the Sommelsdijk canal it can reach the Saramacca; and from the Saramacca it can proceed up the Coppename, and by means of the Nickerie find its way to the Corantyn.

Climate.—The climate of Surinam has long enjoyed a reputation for exceptional unhealthiness which it does not appear to deserve. Though hot and moist like a Turkish bath, it seems congenial even to the European constitution. The mean temperature of the year is 80·4° Fahr., that of the coldest month 78° and that of the warmest 99°. On the average of the eight years from 1847 to 1854 the rainfall at Monbijou is 129 inches, at Paramaribo 101, at Gelderland 108, at Groningen 91, and at Nickerie 67. According to the tables at the end of the *Jaarboek of the Kon. Nederlandsch Meteor. Instit.* (Utrecht), the greatest quantity falls in May, June, July, September, and December. There are no endemic diseases; and though cholera, fevers, and small-pox have appeared from time to time, they are not more violent than in more temperate regions. Leprosy and elephantiasis, introduced it is believed from Barbados, are not infrequent among the negro population. The former is locally known as boassi. In 1790 there were only 7 patients in the lazaretto of Voorzoorg, but by 1797 they had increased to 300, and in 1812 to 500. A new establishment was founded at Batavia on the right bank of the Coppename in 1823. Between 1831 and 1839 an average of 103 suspected persons were examined yearly, and 46 declared infected. In 1853 there were 448 inhabitants (216 males and 232 females) in the settlement; of these however 112 were personally free from the disease, though born and brought up among the patients.

Population.—Between 1838 and 1852 the free population of Surinam increased from 8893 (4242 males and 4651 females) to 13,193 (6709 males and 6484 females). In 1855 the total number of slaves was 31,780, of whom 27,914 (13,556 males and 14,358 females) were on the plantations and 3866 (2027 males and 1839 females) in private service. Since the abolition in 1863 many attempts have been made to augment the working population of the colony. Up till 1874 the total number of immigrants was 9049, of whom at least 2028 died. In 1870 a convention was signed between Holland and England for the regulation of the coolie traffic, and a Dutch Government agent for Surinam was appointed at Calcutta. In 1873 2448 immigrants arrived from British India, and 1405 in 1874; but owing to dissatisfaction on the part of England with the Dutch arrangements there were none in 1875 and 1876. In December 1875 the whole population was stated at 51,329 (26,074 males and 25,255 females), exclusive of about 17,000 bush negroes and an uncertain number of Indians. There were 706 Europeans besides the soldiers and seamen in garrison and harbour, and the immigrants amounted to 4007 (2834 males and 1173 females), and comprised 2959 from British India, 598 from the West Indies, 352 Chinese from China, and 67 from the Dutch Indies, and 37 settlers from the Netherlands.

The bush negroes (bosch-negers) are the descendants of runaway slaves. They consist of three tribes—the Aukianians, the Saramaccans, and the Bekour or Moesinga. The first, who number from 3000 to 4000, have their chief settlements in the district near the junction of the Lava

and the Tapanahoni with the Upper Marowijne, but they are also settled on the Sara-Creek, on the Upper Cottika, and on the Curmotibo. The Saramaccans, who are numerically about as important, dwell between the Saramacca and the Upper Surinam. The bush negroes retain curious traces of their former connexion with Christianity, though they are and consider themselves pagans. Their chief god is Gran Gado (grand-god), his wife is Maria, and his son Jesi Kist. Various minor deities are also worshipped, Ampuka the bush-god, Toni the water-god, &c. Among themselves they speak a language based on a bastard English, mingled with many Dutch, Portuguese, and native elements. The Moravian missionaries have promoted its cultivation, but it is almost certain to give way before the Dutch.¹

Vegetation.—A large portion of Dutch Guiana is covered with primeval forests; but hitherto the lack of labour and cost of transport have prevented the utilization of its vast supplies of timber and cabinet wood. In some years indeed the export of these materials is actually exceeded by the import. An idea of the wealth that awaits the future prospector may be obtained from Focke's paper in the *West Indië* for 1855, where a list is given of 77 different kinds. Among the more important are the bolletrie (*Lucuma mammosum*), known in the Netherlands as pardenflesch or horse-flesh; the bruinhart (*Youacapoua americana*, Aubl.); the barklak (*Lecythis ollaria*), which is never attacked by worms; the geelhart (*Acalandra Rodiaci*, Schomb.); the male and female letterwood; the purpuurhart (*Copaifera bracteata*, L.); the kankar tree (*Bombax Ceiba*); the locust or courbaril, which is good both for timber work and furniture; and the kopie (*Gouyia tomentosa*), largely used for flooring. Besides the banana, to which the negro is indebted for a large part of his sustenance, maize, sorghum, or Curaçoa maize, yams, kayers (*Arum esculentum*), arrowroot, okro or gunbo, the ground nut or pienda (*Arachis hypogæa*), Spanish pepper, the anrua (*Solanum macrocarpum*), the bilambi, the zuurzak (*Anona muricata*), the pomme de Cythère (*Spondias cytherea*), and the *Mammea americana* may be mentioned from the vast list of plants of interest for their edible products.²

Commerce.—The great staple of Surinam industry was formerly sugar. Between 1849 and 1863 the average quantity exported was 302,857 cwts.; in 1865, two years after the emancipation of the slaves, it sank as low as 151,842 cwts.; and though it has again increased, the average between 1864 and 1874 is only 212,906 cwts. In 1876 the production was 218,115 cwts., and the export 198,274 cwts. The first cocoa from Surinam was sent to Amsterdam in 1733; but it is only since about 1855 or 1860 that it has risen into favour with the colonists. In 1876 the production was no less than 262,907 cwts., and the export 26,062 cwts. Cotton and coffee are next in order, the former having a yield in 1876 of 3806 cwts. and the latter of 245 cwts. The total exports of the colony had a value of 2,762,568 gulden or florins; of which Great Britain took 969,945, the United States 872,277, and the Netherlands 505,064. Of the total imports, valued at 3,183,252 gulden, the mother country furnished the value of 1,228,408.

Minerals.—The gold-diggings of Surinam are beginning to attract attention, the commission of 1874 having found a rich auriferous district about the Marowijne. By May 1876, 519,000 acres of land had been rented to private persons, and a fair amount of success has attended their labours. The lead, silver, and iron ores may yet prove of importance.

Administration.—In 1865 several changes were introduced into the government of Surinam. The Code Napoléon was adopted, subject to modification from time to time by orders in council. A house of assembly was constituted, the members of which were never to be less than nine nor more than thirteen,—four being appointed by the Government and the others by the electors. The franchise was given to all citizens paying 40 gulden of taxes. Elected members serve for six years. The ordinances of the governor in council become law only if passed in the assembly and sanctioned by the king; but a royal decree may overrule the strongest opposition of the assembly, and not infrequently the national assembly of the Netherlands disallows what has been introduced in the budget by the colonial assemblies. Besides the supreme

¹ Seventeen publications are mentioned by Willschlägel in his *Kurzgefasste Neger-Englische Grammatik* (Bautzen, 1854). Focke issued a *Neger-Englisch Woordenboek* (Leyden, 1855), and Willschlägel a *Deutsch Neger-Englisches Wörterbuch* (Löbau, 1865).

² Further information on the rich tropical flora of the colony will be found in Teenstra, *Landbouw in de Kolonie Suriname*, Groningen, 1835; Van Fermin, *Hist. Nat. de la Hollande équinoxiale*, Amsterdam, 1765; Dozy and Molkenboer, "Prodronus Floræ bryologice Surinamensis," in *Verhandl. van de Holl. Maatsch. der Wetensch. te Haarlem*; and A. C. Focke, "De quibusdam orchidibus Surinamensibus" in Mohl and Schlechtendal's *Botan. Zeitung*, 1853.

court at Paramaribo, there are three cantonal and three district courts. The president and four permanent members of the supreme court are nominated by the crown.¹ "The king," says Mr Palgrave, "is almost everything;" the "Lords," in a consultative capacity, are something; and the "Commons" are merely honorary.

History.—The Dutch began to visit the coasts of Guiana about 1580, and we find Adriaan van Iliaaf sending vessels thither in 1599. In 1614 the states of Holland granted to any Dutch citizen four years' monopoly of any harbour or place of commerce which he might discover in that region. The first settlement, however, in Surinam (in 1630) was made by an Englishman, whose name is still preserved by Marshal's Creek. When Cayenne was taken by the French in 1664 a number of Jews who had settled in that part of Guiana removed to the Surinam district, where they soon constituted an important and flourishing community. In 1666 the English settlement was taken by storm by the Zealanders under Crijssen or Krijssen (the name is spelt in various ways), and 100,000 lb of sugar were exacted as a ransom. By the peace of Breda the Dutch were formally recognized as masters of Guiana, and though the Willoughbys, who considered their rights infringed, did all they could to weaken the colony and draw off a large part of its English population to Jamaica, it continued to flourish, and was confirmed to the Dutch by the treaty of Westminster in 1674. For some time the Zealanders claimed that they alone had right to the country, but it was ultimately decided that the possession was a national one in the full sense of the word. The New Dutch West Indian Company, founded in 1674 to replace the older company which had failed, received Guiana by charter from the states general in 1682.² In the following year the company sold one-third of their territory to the city of Amsterdam, and another third to Cornelis van Aerssens, lord of Sommelsdijk. The new owners and the company incorporated themselves as the Chartered Society of Surinam, and Sommelsdijk agreed to fill the post of governor of the colony at his own expense. The lucrative trade in slaves was retained by the West Indian Company, but the society could import them on its own account by paying a fine to the company. Sommelsdijk's rule was marked by rare wisdom and energy. He repressed and pacified the Indian tribes; he erected forts and disciplined the soldiery; he constructed the canal which still bears his name; he established a high court of justice; he introduced the cultivation of the cocoa-nut; and in short he devoted himself in all ways to the welfare of the colony. But on 17th June 1688 he was massacred in a mutiny of the soldiers. The "third" which Sommelsdijk possessed was offered by his widow to William III. of England, but it was ultimately purchased by the city of Amsterdam for 700,000 fl. In 1712 the French, under Cassard, sailed up the river and put Paramaribo to ransom; and after their departure there was hot dispute between the Society and the colonists as to who should pay the indemnity. During the rest of the 18th century the chief troubles of Surinam were the bush negroes and the slaves. Peace with the Aukan negroes was made in 1760, and with the Saramaccans in 1762; but in 1776 the governor Neypveu still found it necessary to surround the colony with a military cordon against the attacks of the Bonni tribe. By the spring of 1786 pacification was complete. In 1795 the Society was abrogated, and the affairs of Surinam placed under a committee of twenty-one members. The English, who had assumed the protectorate of the colony from 1799 to 1802, took actual possession in 1804, and appointed Sir Charles Green governor. In 1807 the slave trade was abolished. At the restoration of the Dutch authority in 1815 the colonists of the district of Nickerie sought to remain under English rule, or at least to receive the right of trading with English colonies. In 1825 the privileges of the Jews were annulled, and the rights of ordinary citizens bestowed on them instead. Surinam and the West Indies were placed under a common government in 1828, but the governor was to reside at Paramaribo. In 1832 several negro slaves who had set fire to the city were publicly burned alive. The administration of Surinam was separated from that of the West Indies in 1845. Baron van Raders, who assumed the governorship in that year, had the honour of greatly improving the state of the slave-laws, and of declaring the commerce of Guiana open to all nations at peace with the Netherlands. The suppression of slavery and the organization of immigration, as already indicated, are the main moments of the recent history of the colony.

Among the older works on Surinam the first rank is held by Hartainck's masterly *Beschrijving van Guiana of de Wilde Kust in Zuid Amerika*, 2 vols. 4to, Amsterdam, 1770. A valuable *Geschiedenis der Kolonie van Suriname*, by a number of "learned Jews," was published at Amsterdam in 1791; and it has been supplemented and so far superseded by Wolbers, *Geschiedenis van Suriname*, Amsterdam, 1861. Sketches of Surinam life are given in the form of a tale in Schaik's *De Manja, Famili- Tafereel*

uit het Surinaamsche Volksleven, Arnheim, 1866; and a number of excellent pictorial illustrations will be found in A. Halberstadt's *Kolonisatie van Europeaan te Suriname*, Leyden, 1872, fol. The English reader is indebted to W. G. Palgrave for a brilliant study on *Dutch Guiana*, London, 1876, reprinted from the *Contemporary Review*. See also the *Jaarboekje of the Lief-rliebende Genootschap "Oefning Kweekt Kennis,"* at Paramaribo; the *Stadkundig Jaarboekje*, published by the *Vereniging voor de Statistiek in Nederland* (Amsterdam); and the *Surinaamsche Almanak*, published by the *Maatsch. tot Nut van't Algemeen*, Leyden and Amsterdam. (H. A. W.)

II. FRENCH GUIANA is bounded on the west by the Maroni or Marowijne, which separates it from Dutch Guiana. Towards the south and east its limits are still uncertain. According to the treaty of Utrecht in 1713 it was to be bounded towards Brazil by the river of St Vincent Pinzon, but the identification of this river has never been officially determined.³ The Oyapock is accepted provisionally by both countries, but the French claim that the Arouari is the real St Vincent Pinzon, and consequently that they have a right to the country for 100 miles further south along the coast. Between the Maroni and the Oyapock the coast-line is about 130 miles. The fourteen quarters of the colony are estimated to have an area of 1,308,739 hectares, i.e., about 3,233,893 acres, or 5052 square miles, nearly as much as half the area of Belgium; but if the frontier be pushed back to the watershed, the whole area of the country could not be less than 53,000 square miles.

Surface.—A considerable portion of the low coast-land of French Guiana is occupied by swamps and marshes, the most deeply submerged of which are covered with a dense growth of mangroves, and receive the name of *prépris*, while the drier stretches are occupied by the pinot or wassay palm (*Eulerpe oleracea*), and are designated *pinotières*. In a few places, as in the Sinnamary quarter, there are peat bogs in process of formation. About 40 or 50 miles inland, where the land begins to rise, the traveller reaches the outskirts of those primeval forests which stretch back vast and vague towards the mountains. Between the narrow maritimo selvage, so to speak, and the commencement of the highlands are undulating plains or savannahs. Hitherto the colony has confined itself almost exclusively to the littoral and alluvial region, with its fertile mud-banks. The savannahs are still in a state of nature; and though the earlier colonists made clearings in the highlands, they soon grew disappointed with the barrenness of the cold granitic soil. The mountains behind Guiana do not exceed 3000 or 4000 feet of elevation; the principal range indeed, the Tumac Humac, was estimated by M. Creveaux, who crossed it in 1877, at no more than 1312 feet above the sea-level. But the dense tropical forests attract so much moisture from the ocean winds that the highlands are the birthplace of a large number of rivers which in the rainy season especially pour down vast volumes of water. Upwards of twenty are counted between the Maroni and the Oyapock. United as they often are in their navigable sections by cross channels, they constitute a valuable means of communication from district to district. Omitting the Maroni already described under Dutch Guiana, the first of importance as we proceed southwards is the Mana, which is navigable for large vessels 10 miles from its mouth, and for smaller vessels 27 miles further. Passing the Sinnamary and the Kourou we next come to the Cayenne, at the mouth of which lies the island on which the colonial capital is built. About a dozen lakes, of which Mepeccucu, Macari, and Mapa are the largest, have been counted in the French territory.

Climate.—The rainy season begins in November or December, and lasts till the latter part of June; but there are usually three or four weeks of good weather in March.

¹ Compare Mr Cohen's Report in Parliamentary Papers [C1861], 1877.
² See the Oevey or Charter in Hartsinck, or in *Verzameling van Statuten aangaande de Surinaamsche Aangelenigheden*, &c., The Hague, 1845.

³ See "Memoria sobre os limites do Brasil com a Guyana Francesa," by J. Cnetano da Silva in *Revista trimestral de Hist. e Geogr.*, Rio de Janeiro, 1850.

During the rest of the year there is often hardly a drop of rain for months. At Cayenne the annual rainfall amounts on an average to from 10 to 11 feet, and it is naturally heavier in the interior. It has been calculated indeed that, if all the fluvial outlets were blocked, a single winter would be sufficient to submerge the whole colony to a depth of 15 or 16 feet. During the hotter part of the year—August, September, October—the temperature usually rises to about 86° F., but it almost never exceeds 88°; in the colder season the mean is 79°, and it seldom sinks so low as 70°. Between day and night there is very little thermometric difference. The longest day is 12 hours 18 minutes, the shortest 11 hours 42 minutes. The prevailing winds are the N.N.E. and the S.E.; and the most violent are those of the N.E. During the rainy season the winds keep between N. and E., and during the dry season between S. and E. Hurricanes are unknown. Sudden rises of the sea are occasionally experienced in November and December. Within the present century there have been three earthquakes (1821, 1843, and 1877), none of which did much damage.

Population.—The population of French Guiana consists of a few pure whites, negroes from Africa, mulattoes, coolies, a decreasing number of Indians, convicts from France and its colonies (among whom are many Arabs from Algeria), and Chinese, Hindu, and Anamite immigrants. In 1877 the fixed population was stated at 17,230, and the floating population included 2300 aboriginal Indians, a military force of 1084, 338 Government officials and ecclesiastics, 4750 workmen connected with the commerce of immigration, and 1380 convicts outside of the penitentiaries; so that in round numbers the total amounted to 27,000. Of the fixed population the males were 7972, and the females 9258. The widows were 1108, while the widowers were 298.

Vegetation.—French Guiana has a rich variety of trees, and several of them are attracting increasing attention from their economic value. The *Leguminosæ* are abundantly represented, including the gayac (*Coumarouna odorata*, Aubl.), the courbaril or locust-tree of Surinam, which grows 70 or 80 feet high without branching, the angélique (*Dicorenia paraensis*), the bois violet or amarante (*Copaifera bracteata*), the pois sabre or oily wapa (*Eperua falcata*, Aubl.), the wacapou or épi de blé (*Andira Aubletii*, Benth.), the *Robinia Panacoco*, the Saint Martin, and the *Machœrium Schomburghii* or tiger wood. To the family of the *Myrtaceæ* belong the *Psidium pomiferum* or guava, the *Couratouri guianensis*, the *Lecythis grandiflora* or monkey-pot tree of British Guiana, the *Lecythis ollaria*, and other species of *Lecythis*; to the *Sapotaceæ*, the *Mimusops Batâta*, the jaune d'œuf or *Lucuma Rivivoca*, and the bartaball or *Lucuma Bonplandii*. Of the *Laurinæ* it is enough to mention the black cedar (*Nectandra Pisi*), the taoub, the bois canelle or cinnamon wood, and several species of *Acrodiolidium*. Among the palms are the cocoa-palm, the oil-palm of Africa, and the date-palm. The timber of the courbaril, the bois violet, and the balata has been found to be of very high excellence. Caoutchouc (*Hevea guianensis*) is common in the contested territory in the south; the elemi-tree (*Teica elemigera*) and the *I. Aracouchini*, which also yields a medical resin, are abundant in the colony. Large quantities of oleaginous seeds might be collected from the yayamadou (*Virola sebifera*) and the crab-wood (*Caropa guianensis*).

The manioc is the principal source of food in French Guiana; rice is becoming an important object of cultivation; and maize, yams, arrowroot, bananas, and the bread-fruit are also known. The Guiana cocoa is excellent; coffee, introduced in 1716, is extensively grown; and vanilla is one of the common wild plants of the country. The clove-tree has been acclimatized, and in the latter years of the empire it formed a good source of wealth; the cinnamon tree was also successfully introduced in 1772, but like that of the pepper-tree and the nutmeg its cultivation is neglected.

Minerals.—Great interest attaches to the gold of Guiana, which promises, or threatens, to modify the life of the colony. Indian traditions affirmed the presence of the precious metal, and Humboldt and Buffon agreed that the geological character of the country indicated the probability of auriferous deposits; but it was not till 1819 that Felix Couy, at the instigation of a Portuguese Indian named Paoline, discovered and opened the first "placer." In 1856 the Approuague company was formed; but, though 5762 oz. were collected between 1857 and 1860, it soon after sold its rights. The Martaroni company has been more successful; 23,842 oz. of gold

were obtained in 1872; 46,044 oz., equal to 4 million francs, were exported from Cayenne in 1874; and in 1875 and 1876 the yield was 4823 oz. per month. As various ferruginous minerals are abundant in some places, it is possible that iron ores may exist.

Commerce.—The total value of the imports into French Guiana in 1871 was 5,903,413 francs; and it exported to the value of 2,556,158 francs to France, 10,600 francs to the French colonies, and 148,839 francs abroad. It is with Martinique that it stands in closest commercial relations, but the imposition in 1872 of a duty on eau de vie from that island has almost put a stop to its importation. Several small steamers maintain communication between different parts of the colony.

Convict Establishments.—It was in 1851 that Guiana was recommended to the French Government by a special commission of inquiry as a suitable place for criminal penitentiaries. In February 1852 transportation thither was offered as a favour to the convicts then under sentence, and more than 3000 of them accepted the change. As the minister of the colonies is allowed by a decree of 1853 to send to Guiana any Asiatics or Africans who are condemned to hard labour or solitary confinement, and as it has been deemed better since 1864 to take the European convicts to New Caledonia, the actual inhabitants of the penitentiary districts are mainly negroes, Arabs, and Anamites. The principal establishments are those of Cayenne, of the three Îles du Salut, of the Kourou, and of the Maroni. The little island La Mère is reserved for the aged, the infirm, and the convalescent. At Saint Laurent on the Maroni there is almost a little town of wooden houses built on brick pillars. The convicts carry on their several trades as carpenters, tanners, bakers, &c. After two years in the colony, those whose conduct has been satisfactory are allowed to contract marriage, to send home for their families, to have a piece of ground assigned to them for cultivation, and to receive the necessary implements. A tramway has been constructed for the use of the "concessions." (See *Rev. Col. et Mar.*, 1876.)

Administration.—Beside the governor and the military commandant, the administrative personnel comprises an *ordonnateur*, a director of the interior, and a procurator-general, as well as a privy council and a director of the penitentiary service. There is a court of appeal and a tribunal of first instance, and justices of peace are appointed for each canton. Cayenne is administered by a municipal council. Religious affairs are under an apostolic prefect.

History.—According even to the French writers, the history of Guiana is little better than a series of disasters. La Revardière, sent out in 1604 by Henry IV. to reconnoitre the country, brought back a favourable report; but the death of the king put a stop to the projects of formal colonization. In 1626 a small body of traders from Roum settled on the Sinnamary, and in 1634 a similar band took up their quarters at Cayenne. The Compagnie du Cap Nord, founded by the people of Rouen in 1643, the Compagnie de la France Équinoxiale, established in 1645, and the second Compagnie de la France Équinoxiale, or Compagnie des Douze Seigneurs, established in 1652, were so many lamentable failures, the result of incompetence, mismanagement, and misfortune. The Compagnie des Indes Occidentales, chartered in 1664 with a monopoly of Guiana commerce for forty years, proved hardly more successful; but in 1674 the colony passed under the direct control of the crown, and the able administration of Colbert began to tell favourably on its progress. The year 1763 was marked by a terrible disaster. Choiseul, the prime minister, having obtained for himself and his cousin Praslin a concession of the country between the Kourou and the Maroni, sent out about 12,000 volunteer colonists, mainly from Alsace and Lorraine. They were landed at the mouth of the Kourou, where no preparation had been made for their reception, and where even water was not to be obtained. Mismanagement had reached its grotesque limits; there was a shop for skates (!), and the necessary tools for tillage were wanting. By 1765 no more than 918 colonists remained alive, and these were a famished fever-stricken band. A long investigation by the parliament of Paris proved only that some one had blundered. Several minor attempts at colonization in Guiana were made in the latter part of the century; but they all seemed to suffer from the same fatal prestige of failure. During the terrible times of the Revolution band after band of political prisoners were transported to Guiana. The fate of the royalists, nearly 600 in number, who were exiled on the 18th Fructidor, was especially sad. Landed on the Sinnamary without shelter or food, two-thirds of them perished miserably. In 1800 Victor Huguea was appointed governor, and he managed to put the colony in a better state; but in 1809 his career was brought to a close by the invasion of the Portuguese and British. Though French Guiana was nominally restored to the French in 1814, it was not really surrendered by the Portuguese till 1817. In 1823, at the suggestion of M. Catineau Laroche, an attempt was made to settle a colony of French agriculturalists in the basin of the Mana; but they were soon driven by fevers from the town of Nouvelle Angoulême, which they had founded. Since that date the principal facts in the history of the unfortunate country are the discovery of its gold-fields and the introduction of the convict establishments.

A detailed bibliography of French Guiana will be found in Ternaux-Compans, *Notice Historique de la Guyane française*, 1843, and in Vietor de Nouvion, *Extraits des auteurs et voyageurs qui ont écrit sur la Guyane*, 1844. Among the works of the present century are—Le Chevalier, *Commission de la colonisation de la Guiane française*, 1843; Bernard, *Coup d'œil sur la situat. agricole de la Guyane française*, 1843; Motézon, *Mission de Cayenne*, 1857; Vidal, "Voy. d'expl. dans le haut Maroni," in *Rev. mar. et col.*, 1862; Gouy, *Reueign. sur la navig. des côtes et des rivières de la Guyane française*, 1865 (Dépot de la marine); Bouyer, *Notes et Souvenirs*, 1867; Sagot, "Exploitation des forêts," in *Rev. mar. et col.*, 1868, and *Agriculture de la Guyane française*, 1874; Delteil, *Voy. chez les Indiens*, 1870; Alfred de Saint Quentin, *Introduction à l'hist. de Cayenne*, 1872; Barveaux, "L'or à la Guyane française," in *Rev. mar. et col.*, 1873; Mourié, *La Guyane française*, 1874; Crevaux, "Voy. en Guyane en 1877," in *Bull. de la Soc. de Géogr.*, 1878, and in *Tour du Monde*, 1878; *Catalogue des produits des Colonies françaises* (Exposition Univ. de 1878), 1878; and Gaffaral, *Les colonies françaises*, 1880.

GUIBERT (1053–1124), of Nogent, a theological and historical writer, who flourished at the close of the 11th and the beginning of the 12th century, was born of rich and noble parents at Clermont-en-Beauvoisis on Easter Eve 1053. Dedicated from infancy to the service of God and the Virgin, he received his early education at the Benedictine abbey of Fley (Flaviacum) or St Germer, in the diocese of Beauvais; there he gave himself with great zeal to study, but chiefly of the secular poets, until a severe illness brought about a crisis in his spiritual life, in consequence of which he began to fix his attention almost exclusively upon the Holy Scriptures and the writings of the fathers, especially of Augustine and Gregory the Great. About this period he was largely influenced by personal intercourse with Anselm, afterwards of Canterbury, who at that time was head of the priory of Bec in the neighbourhood of St Germer's. Encouraged by his friend he now devoted his energies to Old Testament exegesis, and wrote a commentary upon the narrative of the creation; this was followed by other literary works both in verse and in prose. In 1104, when he had completed his fiftieth year, he was chosen to be head of the abbey of Notre Dame de Nogent, and there the remainder of his life was spent in a high degree of theological and ecclesiastical activity. He died in 1124.

His works, edited by D'Achery, were first published in 1651, in one volume folio, at Paris (*Venerabilis Guiberti Abbatis B. Mariae de Novigento Opera Omnia*); they include, besides minor works, a treatise on homiletics (*Liber quo ordine sermo fieri debeat*); ten books of *Moralia* on Genesis, begun in 1084, but not completed until 1116; composed on the model of Gregory the Great's *Moralia in Jobum*; five books of *Tropologiae* on Hosea, Amos, and the Lamentations; a treatise on the *Incarnation*, against the Jews; four books *De Pignoribus Sanctorum*, a remarkably free criticism on the abuses of saint and relic worship; eight books of the *Historia quæ dicitur Gesta Dei per Francos, sive Historia Hierosolymitana*, a history of the first crusade, which constitutes one of our best authorities on the events with which it deals; and three books *De Vita Sua, sive Monodiarum*. See Migne's *Patrologia Latine*, vols. clvi. and clxxxiv.

GUIBERT, or WIBERT (c. 1030–1100), of Ravenna, better known as the antipope Clement III., was born of noble parents in the 11th century at Parma, where, on attaining the canonical age, he entered the priesthood. During the minority of Henry, Guibert was appointed by the empress Agnes to the chancellorship of the kingdom of Italy; and in this capacity he steadfastly resisted, in the interests of the crown, the innovations of Hildebrand in relation to papal elections. For his services in this he was rewarded with the archbishopric of Ravenna, to which he was consecrated in 1073; his fidelity to Henry during the struggles which followed Hildebrand's accession to the papal throne as Gregory VII. led to his being ecclesiastically suspended in 1075. By thirty bishops of the imperialist party he was elected pope at Brixen in 1080, an election which was confirmed by the synod which Henry had convened in Rome in 1084, Guibert assuming the title

of Clement III. Although it was from his hands that Henry received his coronation, Clement III. met with scant recognition from the clergy and exercised few papal functions; and his name is not enrolled in any list of popes. He died in September 1100, and was buried at Ravenna; by the order of Paschalis II. his ashes were afterwards disinterred and scattered to the winds. See Giesebrecht's *Kaisergeschichte*, vol. iii.

GUICCIARDINI, FRANCESCO (1483–1540), the celebrated Italian historian and statesman, was born at Florence in the year 1483, when Marsilio Ficino held him at the font of baptism. His family was illustrious and noble; and his ancestors for many generations had held the highest posts of honour in the state, as may be seen in his own genealogical *Ricordi* (*Op. Ined.*, vol. x.). After the usual education of a boy in grammar and elementary classical studies, his father, Piero, sent him to the universities of Ferrara and Padua, where he stayed until the year 1505. The death of an uncle, who had occupied the see of Cortona with great pomp, induced the young Guicciardini to banke after an ecclesiastical career. He already saw the scarlet of a cardinal awaiting him, and to this eminence he would assuredly have risen. His father, however, checked this ambition, declaring that, though he had five sons, he would not suffer one of them to enter the church in its then state of corruption and debasement. Guicciardini, whose motives were confessedly ambitious (see *Autobiogr. Ricordi, Op. Ined.*, x. p. 68), turned his attention to law, and at the age of twenty-three was appointed by the signoria of Florence to read the *Institutes* in public. Shortly afterwards he engaged himself in marriage to Maria, daughter of Alamanno de' Salviati, prompted, as he frankly tells us, by the political support which an alliance with that great family would bring him (*ib.*, x. 71). He was then practising at the bar, where he won so much distinction that the signoria, in 1512, entrusted him with an embassy to the court of Ferdinand the Catholic. Thus he entered on the real work of his life as a diplomatist and statesman. His conduct upon that legation was afterwards severely criticized; for his political antagonists accused him of betraying the true interests of the commonwealth, and using his influence for the restoration of the exiled Casa Medici to power. His Spanish correspondence with the signoria (*Op. Ined.*, vol. vi.) reveals the extraordinary power of observation and analysis which was a chief quality of his mind; and in Ferdinand, hypocritical and profoundly dissimulative, he found a proper object for his scientific study. To suppose that the young statesman learned his frigid statecraft in Spain would be perhaps too simple a solution of the problem offered by his character, and scarcely fair to the Italian proficients in perfidy. It is clear from Guicciardini's autobiographical memoirs that he was ambitious, calculating, avaricious, and power-loving from his earliest years; and in Spain he had no more than an opportunity of studying on a large scale those political vices which already ruled the minor potentates of Italy. Still the school was pregnant with instructions for so apt a pupil. Guicciardini issued from this first trial of his skill with an assured reputation for diplomatic ability, as that was understood in Italy. To unravel plots and weave counterplots; to meet treachery with fraud; to parry force with sleights of hand; to credit human nature with the basest motives, while the blackest crimes were contemplated with cold enthusiasm for their cleverness, was reckoned then the height of political sagacity. Guicciardini could play the game to perfection. In 1515 Leo X. took him into service, and made him governor of Reggio and Modena. In 1521 Parma was added to his rule, and in 1523 he was appointed viceregent of Romagna by Clement VII. These high offices rendered Guicciardini the virtual master of the papal states beyond the Apennines, during a period of great bewilder-

ment and difficulty. The copious correspondence relating to his administration has recently been published (*Op. Ined.*, vols. vii., viii.). In 1526 Clement gave him still higher rank as lieutenant-general of the papal army. While holding this commission, he had the humiliation of witnessing from a distance the sack of Rome and the imprisonment of Clement, without being able to rouse the perfidious duke of Urbino into activity. The blame of Clement's downfall did not rest with him; for it was merely his duty to attend the camp, and keep his master informed of the proceedings of the generals (see the Correspondence, *Op. Ined.*, vols. iv., v.). Yet Guicciardini's conscience accused him, for he had previously counselled the pope to declare war, as he notes in a curious letter to himself written in 1527 (*Op. Ined.*, x. 104). Clement did not, however, withdraw his confidence, and in 1531 Guicciardini was advanced to the governorship of Bologna, the most important of all the papal lord-lieutenancies (Correspondence, *Op. Ined.*, vol. ix.). This post he resigned in 1534 on the election of Paul III., preferring to follow the fortunes of the Medicean princes. It may here be noticed that though Guicciardini served three popes through a period of twenty years, or perhaps because of this, he hated the papacy with a deep and frozen bitterness, attributing the woes of Italy to the ambition of the church, and declaring he had seen enough of sacerdotal abominations to make him a Lutheran (see *Op. Ined.*, vol. i. 27, 104, 96, and *Ist. d' It.*, ed. Ros., ii. 218). The same discord between his private opinions and his public actions may be traced in his conduct subsequent to 1534. As a political theorist, Guicciardini believed that the best form of government was a commonwealth administered upon the type of the Venetian constitution (*Op. Ined.*, i. 6; ii. 130 sq.); and we have ample evidence to prove that he had judged the tyranny of the Medici at its true worth (*Op. Ined.*, vol. i. 171, on the tyrant; the whole *Storia Fiorentina* and *Reggimento di Firenze*, *ib.* i. and iii., on the Medici). Yet he did not hesitate to place his powers at the disposal of the most vicious members of that house for the enslavement of Florence. In 1527 he had been declared a rebel by the signoria on account of his well-known Medicean prejudices; and in 1530, deputed by Clement to punish the citizens after their revolt, he revenged himself with a cruelty and an avarice that were long and bitterly remembered. When, therefore, he returned to inhabit Florence in 1534, he did so as the creature of the dissolute Alessandro de' Medici. Guicciardini pushed his servility so far as to defend this infamous despot at Naples in 1535, before the bar of Charles V., from the accusations brought against him by the Florentine exiles (*Op. Ined.*, vol. ix.). He won his cause; but in the eyes of all posterity he justified the reproaches of his contemporaries, who describe him as a cruel, venal, grasping seeker after power, eager to support a despotism for the sake of honours, offices, and emoluments secured for himself by a bargain with the oppressors of his country. Varchi, Pitti, Segni, and Nardi are unanimous upon this point; but it is only the recent publication of Guicciardini's private MSS. that has made us understand the force of their invectives. To plead loyalty or honest political conviction in defence of his Medicean partisanship is now impossible, face to face with the opinions expressed in the *Ricordi Politici* and the *Storia Fiorentina*. Like Macchiavelli, but on a lower level, Guicciardini was willing to "roll stones," or to do any dirty work for masters whom, in the depth of his soul, he detested and despised. After the murder of Duke Alessandro in 1537, Guicciardini espoused the cause of Cosimo de' Medici, a boy addicted to field sports, and unused to the game of statecraft. The wily old diplomatist hoped to rule Florence as grand vizier under this inexperienced princeling. He was mistaken, however, in his schemes, for Cosimo displayed the genius of his family

for politics, and coldly dismissed his would-be lord-protector. Guicciardini retired in disgrace to his villa, where he spent his last years in the composition of the *Istoria d'Italia*. He died in 1540 without male heirs.

Guicciardini was the product of a cynical and selfish age, and his life illustrated its sordid influences. Of a cold and worldly temperament, devoid of passion, blameless in his conduct as the father of a family, faithful as the servant of his papal patrons, severe in the administration of the provinces committed to his charge, and indisputably able in his conduct of affairs, he was at the same time, and in spite of these qualities, a man whose moral nature inspires a sentiment of liveliest repugnance. It is not merely that he was ambitious, cruel, revengeful, and avaricious, for these vices have existed in men far less antipathetic than Guicciardini. Over and above those faults, which made him odious to his fellow-citizens, we trace in him a meanness that our century is less willing to condone. His phlegmatic and persistent egotism, his sacrifice of truth and honour to self-interest, his acquiescence in the worst conditions of the world, if only he could use them for his own advantage, combined with the glaring discord between his opinions and his practice, form a character which would be contemptible in our eyes were it not so sinister. The social and political decrepitude of Italy, where patriotism was unknown, and only selfishness survived of all the motives that rouse men to action, found its representative and exponent in Guicciardini. When we turn from the man to the author, the decadence of the age and race that could develop a political philosophy so arid in its cynical despair of any good in human nature forces itself vividly upon our notice. Guicciardini seems to glory in his disillusionment, and uses his vast intellectual ability for the analysis of the corruption he had helped to make incurable. If one single treatise of that century should be chosen to represent the spirit of the Italian people in the last phase of the Renaissance, the historian might hesitate between the *Principe* of Macchiavelli and the *Ricordi Politici* of Guicciardini. The latter is perhaps preferable to the former on the score of comprehensiveness. It is, moreover, more exactly adequate to the actual situation, for the *Principe* has a divine spark of patriotism yet lingering in the cinders of its frigid science, an idealistic enthusiasm surviving in its moral aberrations; whereas a great Italian critic of this decade has justly described the *Ricordi* as "Italian corruption codified and elevated to a rule of life." Guicciardini is, however, better known as the author of the *Storia d'Italia*, that vast and detailed picture of his country's sufferings between the years 1494 and 1532. Judging him by this masterpiece of scientific history, he deserves less commendation as a writer than as a thinker and an analyst. The style is wearisome and prolix, attaining to precision at the expense of circumlocution, and setting forth the smallest particulars with the same distinctness as the main features of the narrative. The whole tangled skein of Italian politics, in that involved and stormy period, is unravelled with a patience and an insight that are above praise. It is the crowning merit of the author that he never ceases to be an impartial spectator,—a cold and curious critic. We might compare him to an anatomist, with knife and scalpel dissecting the dead body of Italy, and pointing out the symptoms of her manifold diseases with the indifferent analysis of one who has no moral sensibility. This want of feeling, while it renders Guicciardini a model for the scientific student, has impaired the interest of his history. Though he lived through that agony of the Italian people, he does not seem to be aware that he is writing a great historical tragedy. He takes as much pains in laying bare the trifling causes of a petty war with Pisa as in probing the deep-seated ulcer of the papacy. Nor is he capable of painting

the events in which he took a part, in their totality as a drama. Whatever he touches, lies already dead on the dissecting table, and his skill is that of the analytical pathologist. Consequently, he fails to understand the essential magnitude of the task, or to appreciate the vital vigour of the forces contending in Europe for mastery. This is very noticeable in what he writes about the Reformation. Notwithstanding these defects; inevitable in a writer of Guicciardini's temperament, the *Storia d' Italia* was undoubtedly the greatest historical work that had appeared since the beginning of the modern era. It remains the most solid monument of the Italian reason in the 16th century, the final triumph of that Florentine school of philosophical historians which numbered Macchiavelli and Vettori, Segni, Pitti, Nardi, Nerli, Varchi, and Giannotti. Up to the year 1857 the fame of Guicciardini as a writer, and the estimation of him as a man, depended almost entirely upon the *History of Italy*, and on a few ill-edited extracts from his aphorisms. At that date his representatives, the Counts Piero and Luigi Guicciardini, opened their family archives, and committed to Signor Giuseppe Canestrini the publication of his hitherto inedited MSS. in ten important volumes. The vast mass of documents and finished literary work thus given to the world has thrown a flood of light upon Guicciardini, whether we consider him as author or as citizen. It has raised his reputation as a political philosopher into the first rank, where he now disputes the place of intellectual supremacy with his friend Macchiavelli; but it has coloured our moral judgment of his character and conduct with darker dyes. From the stores of valuable materials contained in those ten volumes, it will be enough here to cite (1) the *Ricordi Politici*, already noticed, consisting of about 400 aphorisms on political and social topics; (2) the observations on Macchiavelli's *Discorsi*, which bring into remarkable relief the views of Italy's two great theorists on statecraft in the 16th century, and show that Guicciardini regarded Macchiavelli somewhat as an amiable visionary or political enthusiast; (3) the *Storia Fiorentina*, an early work of the author, distinguished by its animation of style, brilliancy of portraiture, and liberality of judgment; and (4) the *Dialogo del Reggimento di Firenze*, also in all probability an early work, in which the various forms of government suited to an Italian commonwealth are discussed with infinite subtlety, contrasted, and illustrated from the vicissitudes of Florence up to the year 1494. To these may be added a series of short essays, entitled *Discorsi Politici*, composed during Guicciardini's Spanish legation. It is only after a careful perusal of these minor works that the student of history may claim to have comprehended Guicciardini, and may feel that he brings with him to the consideration of the *Storia d' Italia* the requisite knowledge of the author's private thoughts and jealously guarded opinions. Indeed, it may be confidently affirmed that those who desire to gain an insight into the true principles and feelings of the men who made and wrote history in the 16th century will find it here far more than in the work designed for publication by the writer. Taken in combination with Macchiavelli's treatises, the *Opere Inedite* furnish a comprehensive body of Italian political philosophy anterior to the date of Fra Paolo Sarpi.

The student may be referred to Rosini's edition of the *Storia d' Italia*, 1852, 1819, 10 vols., and to the *Opere Inedite*, in 10 vols., published at Florence, 1857. These two books place him in possession of all that is extant of Guicciardini. (J. A. S.)

GUIDI, CARLO ALESSANDRO (1650-1712), Italian lyric poet, was born at Pavia in 1650. As chief founder of the well-known Roman academy called "L'Arcadia," he had a considerable share in the reform of Italian poetry, corrupted at that time by the extravagance and bad taste of the poets Marini and Achillini and their school. The

poet Guidi and the critic and juriconsult Gravina checked this evil by their influence and example. The genius of Guidi was lyric in the highest degree; his songs are written with singular force, and charm the reader, in spite of touches of bombast. His most celebrated song is that entitled *Alla Fortuna* (To Fortune), which certainly is one of the most beautiful pieces of poetry of the 17th century. Guidi was squint-eyed, humpbacked, and of a delicate constitution, but possessed undoubted literary ability. His poems were printed at Parma in 1671, and at Rome in 1704. In 1681 he published at Parma his lyric tragedy *Amalasantia in Italy*, and two pastoral dramas *Daphne* and *Endymion*. The last had the honour of being mentioned as a model by the critic Gravina, in his treatise on poetry. Less fortunate was Guidi's poetical version of the six homilies of Pope Clement XI., first as having been severely criticized by the satirist Settano, and next as having proved to be the indirect cause of the author's death. A splendid edition of this version had been printed in 1712, and, the pope being then in San Gandolfo, Guidi went there to present him with a copy. On the way he found out a serious typographical error, which he took so much to heart that he was seized with an apoplectic fit at Fraseati and died on the spot. Guidi was honoured with the special protection of Ranuccio II., duke of Parma, and of Queen Christina of Sweden.

GUIDICIONI, GIOVANNI, one of the best Italian poets of the first half of the 16th century, was born at Lucca in 1480, and died at Macerata in 1541. He occupied a high position, being bishop of Fossombrone and president of Romagna. The latter office nearly cost him his life; a murderer attempted to kill him, and had already touched his breast with his dagger when, conquered by the resolute calmness of the prelate, he threw away the weapon and fell at his feet, asking forgiveness. The *Rime* and *Letters* of Guidicioni are models of elegant and natural Italian style. The best editions are those of Genoa (1749), Bergamo (1753), and that recently published at Florence.

GUIDO OF AREZZO, an Italian monk of the 11th century, has by many been called the father of modern music, and a portrait of him in the refectory of the monastery of Avellana bears the inscription "Beatus Guido, inventor musicæ." Although these statements are manifestly exaggerated, it is none the less true that Guido's reforms mark an enormous progress in the notation as well as in the teaching of music. Of his life little is known, and that little is chiefly derived from the dedicatory letters prefixed to two of his treatises and addressed respectively to Bishop Theodald (not Theobald, as Burney writes the name) of Arezzo, and Michael, a monk of Pomposa and Guido's pupil and friend. Occasional references to the celebrated musician in the works of his contemporaries are, however, by no means rare, and from these it may be conjectured with all but absolute certainty that Guido was born in the last decade of the 10th century. The place of his birth is, beyond a doubt, Arezzo; for on the title-page of all his works he is styled *Guido Aretinus*, or simply *Aretinus*. At his first appearance in history Guido was a monk in the Benedictine monastery of Pomposa, and it was there that he invented his educational method, by means of which, according to his own statement, a pupil might learn within five months what formerly it would have taken him ten years to acquire. Envy and jealousy, however, were his only reward, and by these he was compelled to leave his monastery—"indo est, quod me vides prolixis finibus exulatum," as he says himself in the second of the letters above referred to. According to one account, he travelled as far as Bremen, called there by Archbishop Hermann in order to reform the musical service. But this statement has been doubted, for chronological and other reasons.

Certain it is that not long after his flight from Pomposa Guido was living at Arezzo, and it was here that, about 1030, he received an invitation to Rome from Pope John XIX. He obeyed the summons, and the pope himself became his first and apparently one of his most proficient pupils. But in spite of his success Guido could not be induced to remain in Rome, the insalubrious air of which seems to have affected his health. In Rome he met again his former superior, the abbot of Pomposa, who seems to have repented of his conduct towards Guido, and to have induced him to return to Pomposa; and here all authentic records of Guido's life cease. We only know that he died, on May 17, 1050, as prior of Avellana, a monastery of the Camaldulians; such at least is the statement of the chroniclers of that order. It ought, however, to be added that the Camaldulians claim the celebrated musician as wholly their own, and altogether deny his connexion with the Benedictines. It is quite in accordance with the semi-mythical character of Guido's life that a great many inventions belonging to earlier as well as to later times have been attributed to him, in the same way as Charlemagne, Arthur, and Roland have been made responsible for the deeds and exploits of other kings and heroes. His eulogists declare that before him church music was in a state of utter barbarism, wholly ignoring the achievements of Gregory the Great, Hucbald, and others. The notation of music by means of the *neumæ* also, although very imperfect for practical purposes, at any rate served to give permanence to the composer's thoughts. There is, however, no doubt that in the latter respect Guido's method shows an enormous progress. It was he who invented, or at least for the first time systematically used, the lines of the staff, and the intervals or *spatia* between them, and thus fixed the principle of modern notation; and the value of this innovation for educational and general artistic purposes cannot be overrated. There is also little doubt that the names of the first six notes of the scale, *ut, re, mi, fa, sol, la*, still in use among Romance nations, were introduced by Guido, although he seems to have used them in a relative rather than in an absolute sense. It is well known that these words are the first syllables of six lines of a hymn addressed to St John the Baptist, which may be given here:—

<i>Ut</i> queant laxis	<i>resonare</i> fibris
<i>Mi</i> ra gestorum	<i>famuli</i> tuorum,
<i>Solve</i> polluti	<i>labii</i> reatum,
Sancte Joannes.	

In addition to this Guido is generally credited with the introduction of the F clef. But perhaps more important than all this is the thoroughly practical tone which Guido assumes in his theoretical writings, and which differs greatly from the clumsy scholasticism of his contemporaries and predecessors.

The most important of Guido's treatises, and those which are generally acknowledged to be authentic, are *Micrologus Guidonis de disciplina artis musicæ*, dedicated to Bishop Theodald of Arezzo, and comprising a complete theory of music, in 20 chapters; *Musicae Guidonis regulæ rhythmicæ in antiphonarîi sui prologum prolatæ*, written in trochaic decasyllables of anything but classical structure; *Alia Guidonis regulæ de ignoto cantu, identidem in antiphonarîi sui prologum prolatæ*; and the *Epistola Guidonis Michaeli monacho de ignoto cantu*, already referred to. These are published in the second volume of Gerbert's *Scriptores ecclesiastici de musica sacra*. A very important manuscript unknown to Gerbert (the *Codex Bibliothecæ Uticensis*, in the Paris library) contains, besides minor treatises, an antiphonarium and gradual undoubtedly belonging to Guido. A comprehensive but very uncritical life of Guido has been written by Luigi Angeloni (*Sopra la vita, &c., di Guido d'Arezzo*). Of infinitely greater importance are the studies on the subject by Herr Kiesewetter and by M. Botté de Toulmon. Burney's *General History of Music*, and Fétis's *Biographie des Musiciens* should also be consulted. A comprehensive and admirable account of Guido's life and work by Dr W. Langhans may be found in the fourth volume of Mendel's *Musikalisches Conversations-Lexikon*.

GUIDO RENI. See RENI.

GUIDO OF SIENA. The name of this painter is of considerable interest in the history of art, on the ground that, if certain assumptions regarding him could be accepted as true, he would be entitled to share with Cimabue, or rather indeed to supersede him in, the honour of having given the first onward impulse to the art of painting. The case stands thus. In the church of S. Domenico in Siena is a large painting of the Virgin and Child enthroned, with six angels above, and in the Benedictine convent of the same city is a triangular pinnacle, once a portion of the same composition, representing the Saviour in benediction, with two angels; the entire work was originally a triptych, but is not so now. The principal section of this picture has a rhymed Latin inscription, giving the painter's name as Gu . . . o de Senis, with the date 1221: the genuineness of the inscription is not, however, free from doubt. In the general treatment of the picture there is nothing to distinguish it particularly from other work of the same early period; but the heads of the Virgin and Child are indisputably very superior, in natural character and graceful dignity, to anything to be found anterior to Cimabue. The question therefore arises, Are these heads really the work of a man who painted in 1221? The best informed connoisseurship of recent years (see especially the discussion of the matter in Messrs Crowe and Cavalcaselle's work, vol. i.) pronounces in the negative, concluding that the heads are repainted, and are, as they now stand, due to some artist of the 14th century, perhaps Ugolino da Siena; thus the claims of Cimabue would remain undisturbed and in their pristine vigour. Beyond this, little is known of Guido da Siena. There is in the Academy of Siena a picture assigned to him, a half-figure of the Virgin and Child, with two angels, dating probably between 1250 and 1300; also in the church of S. Bernardino in the same city a Madonna dated 1262. Milanese thinks that the work in S. Domenico is due to Guido Graziani, of whom no other record remains earlier than 1278, when he is mentioned as the painter of a banner. Guido da Siena appears always to have painted on panel, not in fresco on the wall. He has been termed, very dubiously, a pupil of Pietrolino, and the master of Diotisalvi, Mino da Turrita, and Berlinghieri da Lucca.

GUIENNE, an old French province, whose name until the 10th century was Aquitania, and whose history until it came into the possession of England in 1152 is given under the heading AQUITANIA. It was bounded by the Pyrenees; Languedoc, Auvergne, Angoumois, Saintonge, and the sea of Gascony; and out of it are now formed the departments of Gironde, Dordogné, Lot, Aveyron, Lot-et-Garonne, Tarn, Landes, Gers, Upper Pyrenees, Ariège, and Lower Pyrenees. The chief town was Bordeaux. Soon after it was joined to the English crown the nobles twice revolted, but were each time subdued, and in 1169 Henry II. of England bequeathed it to his son Richard (Cœur de Lion), who after quelling all symptoms of revolt added in 1186 and 1188 Toulouse and Rochelle to his French possessions. In 1196 he bequeathed it to his nephew Otto of Brunswick, but he resumed its possession in 1198, when Otto was chosen king of Germany. After the death of Richard in 1199, his mother Eleanor retained possession of it during her lifetime. It was reconquered by the French in the reign of Edward I. of England, but at the peace of 1303 it was again ceded to the English, with whom it remained till 1451, when it was conquered and finally united to France by Charles VII. In 1469 Louis IX. gave it in exchange for Champagne and Brie to his brother the duke of Berri, after whose death in 1472 it was again united to the French crown.

GUIGNES, JOSEPH DE (1721-1800), a French Orientalist, born at Pontoise October 19, 1721, became in his fifteenth year a student of Oriental languages, and especially of Chinese, at the Collège Royal under the celebrated

Fourmont, whom in 1745 he succeeded at the Royal Library as secretary interpreter of the Eastern languages. A *Mémoire Historique sur l'Origine des Huns et des Turcs*, published by De Guignes in 1748, having brought his name with some prominence before the learned world, he was admitted a member of the Royal Society of London in 1752 and an associate of the French Academy of Inscriptions in 1754. Two years later he gave to the world the first two volumes of his learned and laborious *Histoire Générale des Huns, des Mongoles, des Turcs, et des autres Tartares occidentaux*; and in 1757 he was appointed to succeed Jault in the chair of Syriac at the Collège Royal. The completion of the *Histoire* by the publication of the three remaining volumes in 1758 was followed in 1759 by the publication of a *Mémoire* in which he propounded and endeavoured to prove the untenable and absurd theory that the Chinese nation had originated in Egyptian colonization, an opinion to which, in spite of every argument, he to the last obstinately clung. To its support, as also to the further elucidation of the chronology and arrangement of his *Histoire*, which had been, not without some justice, unfavourably criticized, he devoted several learned papers which are to be found in the *Mémoires* of the Academy of Inscriptions; and among his other literary labours, an improved edition of an old translation of the *Shoo-king* is worthy of special mention. The Revolution, while permitting De Guignes to retain some insignificant pensions which had been conferred upon him, deprived him of various posts, such as those of keeper of the antiquities in the Louvre and editor of the *Journals des Savans*, on which he was chiefly dependent for his income; and his later years are said to have brought to him considerable personal hardship, from which his sole refuge was in redoubled application to study. He died at Paris, March 19, 1800. The *Histoire* had been translated into German by Dähnert (1768-71). De Guignes left a son, Christian Louis Joseph (1759-1845), who, after learning Chinese from his father, went as consul to Canton, where he spent seventeen years. On his return to France he was charged by the Government with the work of preparing a Chinese-French-Latin dictionary. Though bearing his name alone on the title-page (1813), it was in reality only a new edition of the work of Glemona. He was also the author of a large work of travels (*Voyages à Pékin, Manille, et l'Île de France*, 1808).

GUILD. The spirit of association has in all ages induced men to join together for the pleasures of mutual enjoyment or for the attainment of some common purpose for which the support of numbers was necessary. The idea has taken shape in various ways, influenced by the temperament of race, the policy of Governments, the social condition of classes, or the need for a special object. Independently of the organization of peoples, of their constitution into towns, provinces, and states as units in a system, whether of self-government or of imposed government,—independently too of those great associations or brotherhoods, the church, the orders of knighthood, the greater and lesser monastic orders, and secret societies,—there is a third kind of association upon a basis distinct from these. The public welfare of a community within certain territorial limits is the great object of Governments, local or imperial; the pursuit of some great moral, religious, or equitable thought, touching the hearts of men in general without regard to nation, was the animating principle of the chivalric and religious orders; but when men began to form themselves into *guilds*, the benefit of each one in his individual and social capacity was concerned, naturally confined within the bounds of neighbourhood. A guild was a voluntary association of those living near together who joined for a common purpose, paying contributions, worshipping together, feasting together periodically, helping one another in sick-

ness and poverty, and frequently united for the pursuit of a special object.

The true history of these institutions has been till recently unnoticed, their value and importance, especially in connexion with the life of towns and villages, having been but imperfectly investigated or understood. Guilds have, however, been numerous, and their influence most important, in Europe from an early period; they attained their highest prosperity and development in the Teutonic countries, and especially in England during the Middle Ages, and they have been widely spread among the Romance nations.

The meaning of the word *guild* or *gild* is closely connected with the origin of the institution. *Gilt* or *geld* was Old English for a set payment or contribution, from *zeldan* or *zyldan*, to pay (whence also the present *yield*), the primary meaning was payment, and the company of those who paid became known by this chief title to membership. There are also *gille*, Danish and Low German, in the sense of a contributory company of this kind; *gjalda* and *gildi*, Icelandic, a payment, and *gildi*, also a banquet. The word therefore, thus derived, is better spelt (as most old authorities have it) without the *u*; a colour is, however, given for the ordinary modern form *guild*, by deriving it (as Wedgwood, *English Etymology*) from the Welsh or Breton *gouil*, a feast or holiday, *gwyld*, keeping a festival.

The essential principle of the guild is the banding together for mutual help, mutual enjoyment, and mutual encouragement in good endeavour. The spirit which directed itself to the inner business and life of each society and its members is the true mark, in some degree, of all bodies, ancient or modern, that can claim the character of guilds. The peace-guild of the North in the 10th century had this character in common with the great trading guild of the 13th and 14th centuries, or the little social or religious guild of an English country village of a century later.

Some German scholars find the origin of the first guilds in the banquets and sacrificial assemblies of the heathen German tribes. Wilda, Dr L. Brentano, and others, connecting these with what is known of the importance of family relations among the Teutonic nations, find in the family union the germ from which the guild was developed, and show that when Christianity was brought from the south of Europe "the spirit of association received a mighty impulse, and the guilds spread themselves rapidly under the influence of Christian doctrine" (Brentano). It is maintained by others that the guilds have sprung from the *collegia*, in those countries where the Romans bore sway.

The Romans exercised the right of association from early times; it is attributed to Numa that he encouraged the formation of craft guilds, of which Plutarch enumerates nine; there also existed early religious societies among them. Exercised voluntarily under the republic, this right became crippled under the empire, and the *collegia* were obliged to seek authorization from the state for the narrower objects to which the imperial decrees attempted to limit them. These societies were numerous, not only at Rome, but throughout the empire, especially in the East, in Italy, and in Gaul; a large number were trade corporations, devoted to the interest of their crafts; others were united for good-fellowship, religion, and many especially to provide for burial. In the provinces, besides merchants and others, the highest persons were glad at times to belong to them; those in Rome under the empire appear to have consisted principally of workmen, freedmen, slaves, and persons of the humbler classes. All appear to have had the same general features; they chose their own masters and officers, made rules for self-government, paid contributions to a common fund, met and feasted together at stated periods, —the freedom of social intercourse being particularly ap-

preciated among the poorer companies. They formed rules for good behaviour at table, and admitted women as members; they "affirmed their existence by a common worship," choosing a patron god. From these and other resemblances Mr H. C. Coote contends that there is an identity between the Roman *collegia* and the guilds of Saxon growth; and M. Raynaudard was an advocate of a similar descent in France and Italy. But though analogous in many respects, as far as is known they lacked the essential element of the guild, that of mutual help in sickness and poverty; the soldiers' colleges, formed in spite of the law which forbade them, approach the nearest to this character, in providing their members with travelling expenses and retiring pensions. The evidence against the connexion between the *collegium* and the guild is regarded by the ablest German writers who have investigated the subject as conclusive, but this interesting historical question has not yet been fully worked out.¹

The Greeks also, in the 2d and 3d centuries B.C., had their associations of the same kind, called *Eranoi* or *Thiasoi*, which were numerous at Rhodes, in the islands of the Archipelago, at the Piræus, and in other important places. These societies partook more nearly of the character of the mediæval guilds than did the Roman; the members paid contributions to a general fund, aided one another in necessity, provided for funerals, met in assembly to deliberate on their affairs, and celebrated feasts and religious sacrifices in common. Strict rules against disorderly conduct were to be enforced by fine; he who did not pay his yearly quota to the society was excluded, unless he could show good cause of poverty or sickness. Women could be members, and were admitted to the meetings. Some of these societies concerned themselves with religion, others with politics or commerce; in the cause of liberal as opposed to official religion, they appear to have done good service.

It is perhaps of little use attempting to ascribe to any one country or race the special initiative of these institutions, any more than it would be to say that the custom of men to congregate in towns originated with this or that nation. Human nature is the same everywhere, and two motives induce men to join together:—weakness, seeking the power of numbers for resisting oppression, or for mutual assistance; and the affinity which those pursuing the same occupation and possessing the same interests have for each other. These motives are sufficient to account for the existence of the *Eranoi* in Greece, contemporary with the *Collegia* of the Romans; they are sufficient to explain why, although the *collegia opificum*, or artisans' guilds, are found as late as the code of Justinian, and that 50 or 60 years later, in the 6th century, we have record of a soap-makers' craft in Naples (Letter of Pope Gregory the Great, lib. x, epist. 26; Migne's *Pat. Curs.*, vol. lxxvii.), the guilds in the towns of Italy should begin a new life in the 10th century (Hegel); they can explain why in England we find from the 7th to the 10th century other guilds actively in existence, while in Norway they were instituted in the 11th century. These societies "may thus have one history in China, another in India, another in Greece or Rome, another in the Europe of the Middle Ages; the like needs will require the like kinds of help, and develop institutions which, amid whatever diversities of outward garb, will substantially fulfil the same ends" (J. M. Ludlow).

In the Middle Ages guilds are recognized as belonging to three or four classes. In the north of Europe the *frith*

or *peace-guild* was an important form, widely spread in early times. These were associations for defence, based upon mutual obligations, "sworn communities for the protection of right and the preservation of liberty;" we see traces of them in England from the laws of Ina (7th century) down to the "Dooms" of London in Athelstan's time (10th century). These statutes of the old London *peace-guild* are thus shortly described by Prof. Stubbs:—

"A monthly meeting is directed, at which there is to be bytting and a refection, the remains of which are to be bestowed in alms: on the death of a member each brother gives a loaf, and sings or pays for the singing of fifty psalms. . . . Each member pays fourpence for common purposes, towards a sort of insurance fund from which the guild makes good the losses of members, and a contribution of a shilling towards the pursuit of the thief. The members are arranged in bodies of ten, one of whom is the head-man; these again are classed in tens under a common leader, who with the other head-men acts as treasurer and adviser of the hundred members."

The early English recognized the responsibility of the guild for the actions of its members and their mutual liability, —the fundamental principle of English institutions for keeping the peace; besides this, the rules still exist of Saxon guilds at Abbotsbury, Woodbury, Cambridge, and Exeter, and show by the many points in common with the social guilds of later English growth whence these derived their descent. Abroad, the *frith* guilds in the 11th and 12th centuries extended over the Continent; one of the most remarkable was founded at Roeskild, under king Canute, for the suppression of the piracy of the vikings. Others, as in Schleswig, Artois, Flensburg, &c., joined for hindering violence and maintaining peace, by all means that law and custom allowed, even against kings. These guilds became of such importance that in many places their law grew to be that of the *commune* or town (see ΒΟΡΟΥΗ). In France the great development of town governments at this period was frequently but the acknowledgment of an already existing defensive guild, or of the important merchant or craft guilds. At Montpellier and Paris, in the beginning of the 13th century, the trade guilds took part in the watch and ward of the city, and thus were a recognized part of the *commune*. The same was the case in London in early times.² Even as late as the 15th century a guild was founded at Ghent, composed of the culverineers, arquebusiers, and gunners, in order to teach the burgesses the use of firearms, so as to be able to defend the town or suppress troubles. It became the chief guild of the city, had public festivities, admitted women as "consœurs," and possessed many of the features of both *peace* and *social* guilds.

In the Frankish empire guilds were numerous for defence, for conviviality, and for religious and social duties, among the serfs and the clergy as well as others; but under Charlemagne and his successors they suffered great oppression, and were persecuted by both ecclesiastical and secular authorities. In later times the clergy formed special societies called *Guilds of Kalenders*, so named from their meeting day having originally been on the kalends of each month (Brentano); these were to be found in many towns on the Continent, sometimes we read of the major and minor guilds for the higher and lower clergy. The only company that is known to have partaken of this character in England was the ancient Guild of the Kalenders at Bristol, which kept the records of that town and other places, and in its later years supported a school for Jews.

A class of guilds widely spread in the Middle Ages, especially in England, were those which have been distinguished by the name of *Social* (Toulmin Smith) or *Religious*

¹ For a valuable sketch of the *Collegia*, including trade-guilds and burial-guilds, see "Les sociétés ouvrières à Rome," by Gaston Boissier, *Revue des Deux Mondes*, December 1871; also "The Friendly Societies of Antiquity," by H. Tompkins, *Oddfellows' Magazine*, April 1868, and the article CLUB.

² The custom of "setting out the watch," or the "marching watch," in London, Bristol, Worcester, &c., on midsummer eve, originated in the part taken in the defence of the city by the trade guilds or companies of those places; it was a kind of "military muster" (Herbert).

(Brentano). These were the small and numerous societies that sprung up all over the country in every village, in small or large towns, at different times as the need arose, or for good neighbourhood's sake. Their objects included "not only devotions and orisons, but also every exercise of Christian charity, and therefore, above all things, mutual assistance of the guild-brothers in every exigency, especially in old age, in sickness, in cases of impoverishment,—if not brought on by their own folly,—and of wrongful imprisonment, in losses by fire, water, or shipwreck, aid by loans, provision of work, and lastly, the burial of the dead. It included further the assistance of the poor and sick, and the visitation and comfort of prisoners not belonging to the guild" (Brentano). These societies were composed of men and women of all ranks, and when, as in some instances, they grew into wealth and popularity, kings and princes did not disdain to become guild-brethren. Henry IV. and Henry VI. were members of the guild of the Trinity at Coventry; Henry VIII. and his queen were members of the guild of St Barbara, of St Katherine's church next the Tower, London. Another prince belonged to the famous guild of St George at Norwich. One guild, however, who said they were "of the rank of common and middling folks," would not admit even a mayor or a bailiff.

Each member took an oath, and paid an admission fee and yearly contribution; they held regular business meetings or "morn-speech," and had an annual "guild-day." Every guild had its livery, which the members were expected to wear at funerals, feasts, &c.; and they had strict rules for good life and behaviour. The little parochial guilds met in a room or in members' houses; if the guild was rich enough it had a hall or "guild-house;" legacies and gifts were made to them, and they lent out of their stock to poor members, or devoted it to some public or charitable object. Schools and churches were founded or helped by these private guilds, as some of the colleges at Cambridge, schools at Coventry, Worcester, Brayles, Sleaford, Ludlow, Bristol, and elsewhere; forty guilds of Bodmin (of which only five were craft guilds) joined in the repair of the church there. Bridges and town-walls were repaired, both in England and in France—in which latter country M. Giry finds some relics of these social guilds. The performing of miracle and other plays, setting out of pageants, and providing of minstrels were undertaken by many of the social as well as by the craft guilds, and in many towns formed an important adjunct to the municipal proceedings, as at Coventry, York, Durham, Norwich, &c.; the Lord Mayor's show of London owes its origin to this custom.¹

These local social guilds were very numerous in England and in the Teutonic countries; it is believed that they were so in France, but little is known of them elsewhere. There were 50 such guilds in the county of Cambridge, 909 in Norfolk, 42 in Bodmin, 80 in Cologne, 70 at Lübeck, &c.

At the time of the Reformation these guilds were abolished in Protestant countries, under pretence of their being superstitious foundations; in Denmark and North Germany their property was devoted to public service, but in England it was handed over to the king and his courtiers, their guild-halls became poor-houses, their pageants were laid aside. A very few of these societies escaped; St George's guild at Norwich continued to live on many years.

Wickliffe, in the 14th century, had complained of the abuses among the guilds, including those of trades. In 1389 returns were made into Chancery of the social and other guilds in England; these, though imperfect, give a valuable body of details, and draw the distinction between the two

great classes of social and trade guilds. The trade guilds have in all countries attracted more attention than the rest, on account of their wealth and importance; they are of two orders, *guilds-merchant* and *craft-guilds*. The guild-merchant arose in this way; the same men who in the growth of towns became citizens by reason of possessing town-land, frequently were also traders; the uncertain state of society in early times naturally caused them to unite for protection of their trade interests in a *gilda mercatoria*, which made internal laws akin to those of other guilds; the success of these private interests enlarged their importance; and when the towns and boroughs obtained confirmation of their municipal life by charter, they took care to have it included that the men of the place should also have their guild-merchant.² Thus these guilds obtained the recognition of the state; in their origin they had been as other guilds, partaking especially of the character of peace-guilds, but now "the citizens and the guild became identical, and what was guild-law" often became the law of the town. In great cities, such as London and Florence, we do not hear of merchant guilds (Norton); there the separate occupations or crafts early asserted their associating power and independence, and the craft-guilds gradually took a place in the organization of the town government. Many craft-guilds, the heads of which were concerned in the government of the commune, are found in Italy between the 9th and the 12th centuries (Perrens, *Hist. de Florence*). But in England and the north of Europe the guilds-merchant during this period, having grown rich and tyrannical, excluded the landless men of the handicrafts; these then uniting among themselves, there arose everywhere by the side of the guilds-merchant the craft-guilds, which gained the upper hand on the Continent in the struggle for liberty in the 13th and 14th centuries. In England these companies usually existed side by side with the old town or merchant guild; until at length their increasing importance caused the decay of the old guilds, and the adoption of these crafts as part of the constitution of the towns (13th to 15th century). The separation of the richer and perhaps the older from the poorer of the companies occurred, and thus arose the paramount influence of a few,—as the twelve great Companies of London, the *Arti Majori* of Florence, and others.

The constitution of the trade-guilds was formed on the model of other guilds; they appointed a master or alderman and other officers, made ordinances, including provisions for religious observance, mutual help, and burial; the town ordinances yet remaining of many places, as of Berwick, Southampton, and Worcester, show traces of the trade laws of the old guilds-merchant. As their principal objects, "the craft-gildmen provided for the maintenance of the customs of their craft, framed further ordinances for its regulation, (including care against fraudulent workmanship), saw these ordinances properly executed, and punished the gild-brothers who infringed them." "Though the craft-guilds, as voluntary associations, did not need confirmation by the authorities at their birth, yet this confirmation became afterwards of the greatest importance, when these gilds wanted to be recognized as special and independent associations, which were thenceforth to regulate the trade instead of the authorities of the town" (Brentano). Hence obtained the practice of procuring a charter in confirmation and recognition of their laws, in return for which certain taxes were paid to the king or other authority. It is therefore erroneous to state, as is sometimes done, that these companies owe their origin to royal charter, or that they required a licence.

Few important towns in Great Britain have been with-

² There are numerous examples of this among the borough records of England and Scotland.

¹ Probably the numerous societies in France and Flanders of the 12th and 13th centuries for keeping the poetic and musical foundation of *Le Feste de Pui* belonged to the class of social guilds. One of them was set up in London (Riley's *Liber Custumarum*).

out a more or less number of craft-guilds. London, York, Exeter, Norwich, Bristol, Coventry, &c., teemed with their life and pageantry. But the Reformation shook these as it destroyed others; the exactions they suffered, and the altered conditions of social economy and labour have contributed to their decay; "all that remains of the ancient guilds in the livery companies of to-day is the common eating and drinking." In the centres of industry of Italy, France, Germany, even in Constantinople, they once formed the strength of commerce, but, abused or decayed, in France they were abolished on 4th August 1789; in Germany their last remnants died in 1869.¹ In Constantinople numerous trade guilds were flourishing up till the war of 1877-78. In Russia there are no true spontaneous guilds; the trade companies were imposed by the imperial orders of Catherine and Peter the Great.

GUILDFORD, a municipal and parliamentary borough and market-town of England, capital of the county of Surrey, is beautifully situated on a gentle acclivity of the northern chalk downs and on the river Wye, crossed there by a bridge of five arches, 30 miles S.S.W. of London. It consists chiefly of one long, wide, and well-built street, and contains a number of old picturesque gabled houses, with quaint lattices and curious doorways. The principal buildings are the ruins of an old castle, erected soon after the Norman conquest, and for a long time used as the county jail; the town-hall, erected in 1683, containing a number of interesting pictures; the corn market-house, erected in 1818; the county hall and assize court in the domestic Gothic style, erected in 1862; the Abbots Hospital, founded by Archbishop Abbot for decayed tradesmen and decayed tradesmen's widows; the county hospital, opened in 1866, erected as a memorial to the Prince Consort; the Royal Free Grammar School, founded in 1509; the Institute, formed in 1844, with museum, library, and reading and lecture rooms; the church of St Mary, in the Anglo-Norman style, of very early origin, and restored in 1863; the church of St Nicholas, in the Gothic style, erected on the site of an ancient structure of Saxon origin; and Holy Trinity church, a red brick structure erected 1749-63, with a square embattled tower. Guildford has corn mills, iron foundries, and breweries. There is considerable trade in corn, and fairs are held for cattle, sheep, horses, and pigs. Guildford first returned members to Parliament in the reign of Edward I. Formerly it had two members, but since the Reform Act of 1867 it returns only one. The population of the municipal and parliamentary borough in 1861, when the municipal and parliamentary limits were co-extensive, was 8020; in 1871 the population of the municipal borough (area 5543 acres) was 9106, and that of the parliamentary borough (644 acres) 9801.

It is probable that Guildford is of Roman origin, but it is first mentioned in the will of King Alfred, who bequeathed it to his nephew Ethelwald. Near it took place, in 1039, the murder of Alfred, youngest son of King Ethelred, and his Roman retinue, by the men of Earl Godwine. It was an occasional residence of the English kings, and a portion of it remained attached to the royal demesnes until 1630, when the whole of the crown lands at Guildford were vested in Murray, earl of Annandale. After various changes they passed in 1736 to the Onslow family, with whom they still remain.

¹ There is, however, a lively movement for the revival of craft-guilds in Germany at the present time (1879).

GUILLEMOT (French, *Guillemot*²), the name accepted by nearly all modern authors for a Sea-bird, the *Colymbus troile* of Linnæus and the *Uria troile* of Latham, which nowadays it seems seldom if ever to bear among those who, from their vocation, are most conversant with it, though, according to Willughby and Ray his translator, it was in their time so called "by those of Northumberland and Durham." Around the coasts of Britain it is variously known as the Frowl, Kiddaw or Skiddaw, Langy (cf. Icelandic, *Langvia*), Lavy, Marrock, Murre, Scout (cf. Coor, vol. vi. p. 341), Scuttock, Strany, Tinker or Tinkershire, and Willock. The number of local names testifies to the abundance of this bird, at least of old time, in different places, but it should be observed that in certain districts some of them are the common property of this species and the Razor-bill. In former days the Guillemot yearly frequented the cliffs on many parts of the British coasts in countless multitudes, and this is still the case in the northern parts of the United Kingdom; but more to the southward nearly all its smaller settlements have been rendered utterly desolate by the wanton and cruel destruction of their tenants during the breeding season, and even the inhabitants of those which were more crowded had become so thinned that, but for the intervention of the Sea Birds Preservation Act (32 and 33 Vict. cap. 17), which provided under penalty for the safety of this and certain other species at the time of year when they were most exposed to danger, they would unquestionably by this time have been exterminated so far as England is concerned. The slaughter, which, before the passing of that Act, took place annually on the cliffs of the Isle of Wight, near Flam-borough Head, and at such other stations frequented by this species and its allies the Razor-bill and Puffin, and the Kittiwake-Gull, as could be easily reached by excursionists from London and the large manufacturing towns, was in the highest degree brutal. No use whatever could be made of the bodies of the victims, which indeed those who indulged in their massacre were rarely at the trouble to pick out of the water; the birds shot were all engaged in breeding; and most of them had young, which of course starved to death through the destruction of their parents, intercepted in the performance of the most sacred duty of nature, and butchered to gratify the murderous lust of those who sheltered themselves under the name of "sportsmen."

Part of the Guillemot's history is still little understood. We know that it arrives at its wonted breeding stations on its accustomed day in spring, that it remains there till, towards the end of summer, its young are hatched and able, as they soon are, to encounter the perils of a seafaring life, when away go all, parents and progeny. After that time it commonly happens that a few examples are occasionally met with in bays and shallow waters. Tempestuous weather will drive ashore a large number in a state of utter destitution—many of them indeed are not unfrequently washed up dead—but what becomes of the bulk of the birds, not merely the comparatively few thousands that are natives of Britain, but the tens and hundreds of thousands, not to say millions, that are in summer denizens of more northern latitudes, no one can yet say. This mystery is not peculiar to the Guillemot, but is shared by all the *Alcidæ* that inhabit the Atlantic Ocean. Examples stray every season across the Bay of Discay, are found off the coasts of Spain and Portugal, enter the Mediterranean and

² The word, however, seems to be cognate with or derived from the Welsh and Manx *Guillem*, or *Gwilym* as Pennant spells it. The association may have no real meaning, but one cannot help comparing the resemblance between the French *Guillemot* and *Guillaume* with that between the English Willock (another name for the bird, as will be seen by the text) and William.

reach Italian waters, or, keeping further south, may even touch the Madeiras, Canaries, or Azores; but these bear no proportion whatever to the mighty hosts of whom they are literally the "scouts," and whose position and movements they no more reveal than do the vedettes of a well-appointed army. The common Guillemot of both sides of the Atlantic is replaced further northward by a species with a stouter bill, the *U. arra* or *U. bruennichi* of ornithologists, and on the west coast of North America by the *U. californica*. The habits of all these are essentially the same, and the structural resemblance between all of them and the Auks is so great that of late several systematists have relegated them to the genus *Alea*, confining the genus *Uria* to the Guillemots of another group, of which the type is the *U. grylla*, the Black Guillemot of British authors, the Dovekey or Greenland Dove of sailors, the Tyst of Shetlanders. This bird assumes in summer an entirely black plumage with the exception of a white patch on each wing, while in winter it is beautifully marbled with white and black. Allied to it as species or geographical races are the *U. mandii*, *U. columba*, and *U. carbo*. All these differ from the larger Guillemots by laying two or three eggs, which are generally placed in some secure niche, while the members of the other group lay but a single egg, which is invariably exposed on a bare ledge. (A. N.)

GUILLOTINE, the instrument for inflicting capital punishment by decapitation, introduced into France at the period of the Revolution. It consists of two upright posts surmounted by a cross beam, and grooved so as to guide an oblique-edged knife, the back of which is heavily weighted to make it fall swiftly and with force when the cord by which it is held aloft is let go. Some ascribe the invention of the machine to the Persians; and previous to the period when it obtained notoriety under its present name it had been in use in Scotland, England, and various parts of the Continent. There is still preserved in the Antiquarian Museum of Edinburgh the rude guillotine called the "maiden" by which the regent Morton was decapitated in 1581. The last persons decapitated by the Scotch "maiden" were the marquis of Argyll in 1661 and his son the earl of Argyll in 1685. It would appear that no similar machine was ever in general use in England; but until 1650 there existed in the forest of Hardwick, which was coextensive with the parish of Halifax, West Riding, Yorkshire, a mode of trial and execution called the gibbet law, by which a felon convicted of theft within the liberty was sentenced to be decapitated by a machine called the Halifax gibbet. A print of it is contained in a small book called *Halifax and its Gibbet Law* (1708), and in Gibson's edition of Camden's *Britannia* (1722). In Germany the machine was in general use during the Middle Ages, under the name of the *Diele*, the *Hobel*, or the *Dolabra*. Two old German engravings, the one by George Penez, who died in 1550, and the other by Heinrich Aldegrever, with the date 1553, represent the death of a son of Titus Manlius by a similar instrument, and its employment for the execution of a Spartan is the subject of the engraving of the eighteenth symbol in the volume entitled *Symbolice Quæstiones de Universo Genere*, by Achilles Bocchi (1555). From the 13th century it was used in Italy under the name of *Mannaia*, for the execution of criminals of noble birth. The *Chronique de Jean d'Anton*, first published in 1835, gives minute details of an execution in which it was employed at Genoa in 1507; and it is elaborately described by Père Labat in his *Voyage en Espagne et en Italie* en 1730. It is mentioned by Puysegur in his *Mémoires* as in use in the south of France, and he describes the execution by it of Marshal Montmorency at Toulouse in 1632. For about a century it had, however, fallen into general disuse on the Continent; and Dr Guillotine, who first suggested its

use in modern times, is said to have obtained his information regarding it from the description of an execution that took place at Milan in 1702, contained in an anonymous work entitled *Voyage Historique et Politique de Suisse, d'Italie, et d'Allemagne*.

Guillotine, who was born at Saintes, May 28, 1738, and elected to the Constituent Assembly in 1789, brought forward on the 1st December of that year two propositions regarding capital punishment, the second of which was that, "in all cases of capital punishment it shall be of the same kind—that is, decapitation—and it shall be executed by means of a machine." The reasons urged in support of this proposition were that, in cases of capital punishment the privilege of execution by decapitation should no longer be confined to the nobles, and that it was desirable to render the process of execution as swift and painless as possible. The debate was brought to a sudden termination in peals of laughter caused by an indiscreet reference of Dr Guillotine to his machine, but his ideas seem gradually to have leavened the minds of the assembly, and after various debates decapitation was adopted as the method of execution in the penal code which became law on the 6th October 1791. At first it was intended that decapitation should be by the sword, but on account of a memorandum by M. Sanson, the executioner, pointing out the expense and certain other inconveniences attending that method, the assembly referred the question to a committee, at whose request Dr Antoine Louis, secretary to the academy of surgeons, prepared a memorandum on the subject. Without mentioning the name of Guillotine, it recommended the adoption of an instrument similar to that which was formerly suggested by him. The assembly decided in favour of the report, and the contract was offered to the person who usually provided the instruments of justice; but, as his terms were considered exorbitant, an agreement was ultimately come to with a German of the name of Schmidt, who, under the direction of M. Louis, furnished a machine for each of the French departments. After satisfactory experiments had been made with the machine on several dead bodies in the hospital of Bicêtre, it was erected on the Place de Grève for the execution of the highwayman Pelletier on the 25th April 1792. While the experiments regarding the machine were being carried on, it received the name *Louissette* or *La Petite Louison*, but the mind of the nation seems soon to have reverted to Guillotine, who first suggested its use; and in the *Journal des Révolutions de Paris* for 28th April 1792, it is mentioned as *la guillotine*, a name which it thenceforth bore both popularly and officially. In 1795 the question was much debated as to whether or not death by the guillotine was instantaneous, and in support of the negative side the case of Charlotte Corday was adduced whose countenance, it is said, blushed as if with indignation when the executioner, holding up the head to the public gaze, struck it with his fist. The connexion of the instrument with the horrors of the Revolution has hindered its introduction into other countries, but in 1853 it was adopted under the name of *Fallschwert* or *Fallbeil* by the kingdom of Saxony, and it has been subsequently introduced into several other German states. It has often been stated that Dr Guillotine perished by the instrument which bears his name, but it is beyond question that he survived the Revolution, and died a natural death in 1814.

See Sodillot, *Réflexions historiques et physiologiques sur le supplice de la guillotine*, 1795; Sue, *Opinion sur le supplice de la guillotine*, 1796; Revellé-Paris, *Étude biographique sur guillotin*, Paris, 1851; *Notice historique et physiologique sur le supplice de la guillotine*, Paris, 1830; Louis Dubois, *Recherches historiques et physiologiques sur la guillotine et détails sur Sanson*, Paris, 1843; and a paper by J. W. Croker in the *Quarterly Review* for December 1843, reprinted separately in 1850 under the title *The Guillotine, a historical Essay*.

GUIMARAES, a fortified city of Portugal, province of Minho, government district of Braga, is beautifully situated on the Ave, 12 miles south-east of Braga. It stands on an acclivity, and with its Moorish towers has a very picturesque appearance. An old castle which was the birthplace of Alphonso, the first king of Portugal, is still in a state of good preservation. Among the four churches may be mentioned the *Colegiata*, founded in 1385, and although modernized still retaining intact its beautiful choir. The principal manufactures are knives and other steel wares, leather, paper, and table linen. In the neighbourhood there are sulphurous springs, with a temperature of 164° Fahr., frequented since the origin of the city in the 4th century. Guimarães was made the chief town of the countship of Portugal in the 11th century by Henry of Burgundy, and retained that honour till 1511, when it was conferred by King Emanuel on Lisbon. The population is about 10,000.

GUINEA, the general name applied by Europeans to part of the western coast region of intertropical Africa. Like many other geographical designations the use of which is controlled neither by natural nor political boundaries, it has been very differently employed by different writers and at different periods. In the widest acceptance of the term, the Guinea coast may be said to extend from 11° N. lat. to 16° S. lat., or in other words, from the neighbourhood of Cape Verga to Cape Negro. Southern or Lower Guinea comprises the coasts of Loango, Congo, Angola, and Benguela; and Northern or Upper Guinea comprises part of Senegambia, the Sierra Leone district, the Grain Coast, the Ivory Coast, the Gold Coast, the Slave Coast, the Niger Delta, and the Calabar district. The Cameroon mountains may be accepted as the limit of the two divisions, though some writers prefer the river Gambia or the equator. In a narrower and perhaps more common use of the name, Guinea is the coast only from Cape Palmas to the Gaboon. Originally, on the other hand, Guinea was supposed to commence as far north as Cape Nun opposite the Canary Islands; and Azurara is said to be the first authority who brings the boundary south to the Senegal. The name is derived from Ginnie, Genna, or Jinnie, a town and kingdom in the Niger district; and, though it appears on a map as early as 1351, it did not come into general use till the close of the 15th century. Few questions in historical geography have been more keenly discussed than that of the first discovery of Guinea by the navigators of modern Europe. It appears from the testimony of Jacopo Doria that two Genoese, Ugolino and Guido de Vivaldi, were sailing south along the African coast in 1291, but there is almost no further record of their voyage. The French claim that in the latter part of the 14th century the people of Dieppe sent out several expeditions to Guinea; and Jean de Bethencourt, who settled in the Canaries about 1402, made explorations towards the south. At length, in the latter half of the 15th century, the consecutive efforts of the navigators employed by Prince Henry of Portugal, Cadamosto, Usodimare, and Diogo Gomes, made the whole region familiar to Europeans.

See Azurara, *Chronica de descobrimento e conquista de Guiné*, published, with an introduction, by Barros de Santarem, Paris, 1843; Villault de Bellefond, *Relation des Costes d'Afrique appellées Guinée*, Paris, 1679; Desmarquets, *Mém. chron. pour servir à l'hist. de Dieppe*, 1875; Major, *Life of Prince Henry the Navigator*, London, 1868; and the elaborate review of Major's work by M. Codine in the *Bulletin de la Soc. de Géogr.*, 1873.

GUINEA FOWL, a well-known domestic gallinaceous bird, so called from the country whence in modern times it was brought to Europe, the *Meleagris* and *Avis* or *Gallina Numidica* of ancient authors.¹ Little is positively known of the wild stock to which we owe our tame birds, nor can

the period of its reintroduction (for there is apparently no evidence of its domestication being continuous from the time of the Romans) be assigned more than roughly to that of the African discoveries of the Portuguese. It does not seem to have been commonly known till the middle of the 16th century, when Caius sent a description and figure, with the name of *Gallus Mauritanus*, to Gesner, who published both in his *Paralipomena* in 1555, and in the same year Belon also gave a notice and woodcut under the name of *Poulle de la Guinée*; but while the former authors properly referred their bird to the ancient *Meleagris*, the latter confounded the *Meleagris* and the Turkey.

The ordinary Guinea Fowl of our poultry-yards is the *Numida meleagris* of ornithologists, and is too common a bird to need description. The chief or only changes which domestication seems to have induced in its appearance are a tendency to albinism generally shown in the plumage of its lower parts, and frequently, though not always, the conversion of the colour of its legs and feet from dark greyish-brown to bright orange. That the home of this species is West Africa from the Gambia² to the Gaboon is certain, but its range in the interior is quite unknown. It appears to have been imported early into the Cape Verd Islands, where, as also in some of the Greater Antilles and in Ascension, it has run wild. Representing the species in South Africa we have the *N. coronata*, which is very numerous from the Cape Colony to Ovampoland, and the *N. cornuta* of Drs Finsch and Hartlaub, which replaces it in the west as far as the Zambesi. Madagascar also has its peculiar species, distinguishable by its red crown, the *N. mitrata* of Pallas, a name which has often been misapplied to the last. This bird has been introduced to Rodriguez, where it is now found wild. Abyssinia is inhabited by another species, the *N. pitlorhyncha*,³ which differs from all the foregoing by the absence of any red colouring about the head. Very different from all of them, and the finest species known, is the *N. vulturina* of Zanzibar, conspicuous by the bright blue in its plumage, the hackles that adorn the lower part of its neck, and its long tail. By some writers it is thought to form a separate genus, *Acryllium*. All these Guinea Fowls are characterized by having the crown bare of feathers and elevated into a bony "helmet," but there is another group (to which the name *Guttera* has been given) in which a thick tuft of feathers ornaments the top of the head. This contains four or five species, all inhabiting some part or other of Africa, the best known being the *N. cristata* from Sierra Leone and other places on the western coast. This bird, apparently mentioned by Marcgrave more than 200 years ago, but first described by Pallas, is remarkable for the structure—unique, if not possessed by its representative forms—of its *furcula*, where the head, instead of being the thin plate found in all other *Gallinae*, is a hollow cup opening upwards, into which the trachea dips, and then emerges on its way to the lungs. Allied to the genus *Numida*, but readily distinguished therefrom among other characters by the possession of spurs, are two very rare forms, *Agelastes* and *Phasidus*, both from Western Africa. Of their habits nothing is known. All these birds are beautifully figured in Mr Elliot's *Monograph of the Phasianida*, from drawings by Mr Wolf. (A. N.)

while it was blue in the former. This would look as if the *Meleagris* had sprung from what is now called *Numida pitlorhyncha*, while the *Gallina Africana* originated in the *N. meleagris*,—species which, as will be seen by the text, have a different range, and if so the fact would point to two distinct introductions—one by Greeks, the other by Latins.

² Specimens from the Gambia are said to be smaller, and have been described as distinct under the name of *N. rendalli*.

³ Mr Darwin (*Anim. and Pl. under Domestication*, i. p. 294), gives this as the original stock of our modern domestic birds, but herein the writer ventures to think he has been misled. As before observed, it may possibly have been the true *meleagris* of the Greeks.

¹ Columella (*De Re Rustica*, viii., cap. 2) distinguishes the *Meleagris* from the *Gallina Africana* or *Numidica*, the latter having, he says, a red wattle (*palea*, a reading obviously preferable to *galea*),

GUINEA-PIG. See CAVY.

GUINGAMP, a town of France, capital of an arrondissement in the department of Côtes-du-Nord, is situated in a large and rich valley on the right bank of the Trieux, 20 miles W.N.W. of St Briec. It was formerly surrounded by walls, portions of which still exist. It has a library, a museum, a prison, and a hospital dating from the 17th century, enlarged in 1830, and having within its grounds an old oak of immense size. There are also several old buildings of interest, including the beautiful church of *Notre Dame du Bon-Secours*, portions of which date from the 13th, 14th, 15th, and 16th centuries respectively, and which has been lately restored; four pillars of the tower of the chapel of Saint Leonard, dating from the 11th century; and the Ursuline convent, dating from the 17th century, now used as a cavalry depot. The beautiful fountain in the Place de Plomb, constructed by Italian artists in the 15th century, was replaced in 1743 by the present structure. The town has manufactures of gingham (to which it gives the name), linen fabrics, thread, leather, and hats; and there is some trade in wine, brandy, cattle, and agricultural produce. Guingamp originally belonged to the dukes of Penthièvre, and was inherited from them by King Louis Philippe. The population in 1876 was 7895.

GUIPUZCOA, the smallest and most densely peopled of the three Basque provinces of Spain, is bounded on the N. by the Bay of Biscay, on the W. by the province of Biscay, on the S. and S.E. by Alava and Navarre, and on the N.E. by the Bidasoa, which separates it from France. Its area is nearly 728 square miles, and in 1870 its estimated population was 180,743. Situated on the northern slope of the great Cantabrian chain, the province has a great variety of surface in mountain, hill, and valley; and the scenery accordingly is highly picturesque and romantic. The coast is much indented, and has numerous harbours, but none of very great importance; the chief are those of San Sebastian, Los Pasajes, Guetaria, Deva, and Fuenterrabia. The rivers (Deva, Urola, Oria, Urumea, Bidasoa) are all short, rapid, and unavigable. The mountains are for the most part covered with forests of oak, chestnut, or pine; holly and arbutus are also common, with furze and heath in the poorer parts. The soil in the lower valleys is generally of hard clay and unfertile; it is cultivated with great care, but the grain raised falls considerably short of what is required for home consumption. The climate though moist, is mild, pleasant, and healthy; fruit is produced in considerable quantities, especially apples for manufacture into "zaragua" or cider. The chief wealth of the province arises from its mineral stores (iron, argentiferous lead, copper) and from its excellent fisheries, which supply the neighbouring provinces (cod, tunny, sardines, oysters). The iron, which is of excellent quality, is smelted with wood. There are also considerable manufactures of woollen and cotton fabrics, paper, and lucifer matches. The people are remarkable for their fine physique, and bold manly spirit, united with honesty, industry, energy, and enterprise. The capital of the province is San Sebastian, with a population of 17,902 in 1876. All the other towns are small, Tolosa alone having a population at all exceeding 5000; Fuenterrabia no longer retains its former importance; Mondragon is entirely dependent on the rich iron mines in its vicinity, and Salinas, on the Deva, on its salt works. A small island in the Bidasoa, called La Isla de los Faisanes, or Isle de la Conférence, is celebrated as the place where the marriage of the duke of Guienne was arranged between Louis XI. and Henry IV. in 1463, where Francis I. the prisoner of Charles V. was exchanged for his two sons in 1526, and where in 1659 "the peace of the Pyrenees" was concluded between D. Luis de Haro and Cardinal

The early history of Guipuzcoa, as of the other Basque provinces, is still the subject of much learned research. Never wholly subdued by the Romans, the Celtiberi in their mountain fastnesses continued to preserve their independence after the fall of the Western Empire until the time of the West-Gothic kings Leovigild (580) and Wamba (672-681). Nominally subject to Charlemagne at a later period, they were prompt to avail themselves of the first opportunity to assert their full independence; their alliance with the Moors, and its results at Roncesvalles are prominent facts in mediæval history. About the 11th century the inhabitants of the Basque districts emerge as organized into a somewhat free confederation of detached republics, owning allegiance to a señor or lord, but under definite constitutional guarantees (*fueros*). In 1202 Guipuzcoa accepted as its lord Alphonso VIII. of Castile, and for many centuries it ranked as a distinct "señorio" attached to the Spanish crown. The last of its distinctive *fueros* was abolished in July 1876.

GUISBOROUGH, or GISBOROUGH, a market-town of England, North Riding of Yorkshire, is situated in a narrow but fertile valley at the foot of the Cleveland Hills, 4 miles from the mouth of the Tees and 10 miles E.S.E. of Middlesborough. It consists chiefly of one wide and handsome street, having many good houses. The principal buildings are the parish church, which though partly rebuilt in 1791 and thoroughly renovated in 1875, has some remains of an ancient structure; the free grammar school, founded in 1561; the town-hall, recently much improved and enlarged; the mechanics' institute, the hospital for old men and women, and the hospital for accidents erected lately by Admiral Chaloner. The ruins of the Austin priory, founded in 1129, are beautifully situated near the eastern extremity of the town. The accumulation of rubbish has been recently removed from its foundations and floors, and a large number of interesting relics discovered. Among the historic personages who were buried within its walls was Robert the Bruce, lord of Annandale, the competitor for the throne of Scotland with John Baliol, and the grandfather of King Robert Bruce. The town within late years has been rapidly increasing, on account of the iron mines in its neighbourhood; and it has also tanneries and breweries. Alum works were established in the reign of Queen Elizabeth by Sir Thomas Chaloner, who introduced the manufacture of alum into England from Italy; but they have been long discontinued. About a mile south-east of the town there is a sulphurous spring discovered in 1822, efficacious in cutaneous, rheumatic, and bilious complaints. The population of the town in 1871 was 5202, and in 1879 about 6500.

GUISCARD. See ROBERT GUISCARD.

GUISE, a fortified town of France, department of the Aisne, arrondissement of Vervins, is situated on the left bank of the Oise, 13 miles N.W. of Vervins. It was formerly the chief town of the Thiérache, a district in the extreme north of France, bordering on Hainault. It has an old castle dating from the 16th century, and a palatial *familière* with accommodation for 400 families. The principal industries are woollen and cotton weaving, iron and copper founding, tanning, and the manufacture of chicory and sugar. The population in 1876 was 6242.

GUISE, HOUSE OF. The House of Guise, which in the 16th century suddenly rose to an eminence unrivalled in Europe, takes title from the place noticed above. The countship of Guise, a fief under the French crown, was carried in 1333 by its holder, Marie of Blois, as her dower to Rodolf, duke of Lorraine. In 1508 René II, the conqueror of Charles the Bold, divided his territories between his sons Antony, who became duke of Lorraine, and received the Germanic part, and Claude, who had the French fief, including Guise.

Claude of Lorraine thus became founder of a great and well-marked family, which occupied the place that had in the fifteenth century been held by the princes of the lilies. Generation after generation we have a duke and a cardinal side by side; they illustrate with singular

fidelity the movements of the period from its Catholic side: the first duke and cardinal belonged to the Renaissance; the second pair threw themselves into the Catholic reaction, and led the resistance to the Reformation in France; the third pair showed the decay of the religious movement, and its transit into political activities, being among the most ambitious statesmen of the later years of the century; while the fourth and last pair feel the breath of Richelieu's absolutism. The family has throughout characteristic qualities,—bravery, ambition, a certain nobleness of sentiment, an imposing presence, and winning manners; they stand between nobility and royalty,—always greater than the one, sometimes even overtopping the other. They seem never to forget that in their veins runs the blood of those who wore or claimed the crowns of Jerusalem and Naples, of Sicily and Hungary. Claude of Lorraine, born in 1496, succeeded in 1508 to a group of lordships, which by their names testify to the high fortunes of the house: besides Guise itself, he had Elbeuf, Aumale, Mayenne, Joinville, Harcourt, Longjumeau, Boves, Sablé, Lambesc, and others. In addition to these, the family gathered to itself relations with Eu, Sully, Ventadour, Aiguillon, Mercœur, Joyeuse, and Nevers; a cardinal's hat, together with a group of splendid church dignities, also went with the house of Guise; the archbishopric of Rheims, the bishopric of Metz, and several other bishoprics were family benefices, which enabled younger members to take an important share in the fortunes of the family. The shield of Claude expresses the pride of the race: we find there not only the Lorraine spread-eagle, the German bird, but also the quarterings of eight sovereign houses, those of the kings of Hungary, Naples, Jerusalem, and Aragon, and of the sovereign lords of Anjou, Guelderland, Flanders, and Bar. This young prince, who claimed so much, and did so much, who both exercised his rights as a foreign prince and took precedence of the proudest in France, attached himself closely to Francis I. He was the most brilliant among the "young men" who displaced the older wisdom of the court of Louis XII. In 1513 he married Antoinette of Bourbon, the duke of Vendôme's daughter and great-aunt of Henry IV.; in 1515 he accompanied Francis to Italy, and showed the mettle of his race at Marignano, where his brother Ferry was killed. From that time he sagaciously avoided the Italian expeditions, and stayed in France, winning popularity as protector of the realm. Thus in 1521 he was on the Spanish frontier, and helped to take Fuenterrabia; in 1522 he opposed the English in the north, covering Paris; next, he defended Champagne from the Germans, clearing that rich district with equal glory and gain. In 1525 he avoided the expedition which ended in the disaster of Pavia, wherein another of his brothers, Francis, was slain; and during the captivity of Francis I. at Madrid, he became virtual head of the regency under the queen, Louise of Savoy. In these dark days he crushed the rising of the peasants of Lorraine and Swabia, which threatened all the east of France. After the king's return, Claude was made (in 1527) duke of Guise, and peer, and governor of Champagne; fresh territory and wealth were added to these honours. He had now reached his highest point; henceforth it is clear that Francis I. regarded him with more jealousy than favour: his ambitious views as to the crown of the "good king René," and hopes of a revived Angevin dynasty, offended the French king, though they were only dreams of the past; for the new spirit of monarchy and national life in the 16th century made any creation of lesser kingdoms on the borderlands of France and Germany impossible. Claude was a man of harsh and narrow character: cautious and persistent, he saw his way, and walked carefully along it all his days. In an age in

which wealth was becoming the most effective of all means of power, he gathered riches in all ways, fair or foul; and though willing to spend for his own advancement, he won and deserved the character of a grasping and greedy prince. His brother John, first cardinal of Lorraine, seconded him in every way; he was as greedy as the duke, though much more open-handed. Accepting the new ideas of the time, he became a splendid Renaissance prelate, the friend of Erasmus and Rabelais, and even of Marot, while, at the same time, he only too faithfully reflected the worst vices of the movement. His church preferment was enormous; he shamelessly took all he could get. He and his brother have the distinction of giving a bad name to a whole country; for, thanks to their rapacity, the Lorrainers got that reputation for avarice and greediness which has unjustly clung to them even to our days. After 1527 the cleverness of the cardinal rather than the prudence of the duke advanced the family. Claude had twelve children, a splendid group of princely youths, who inherited the handsome features and figure of their father, with even greater abilities and a more effective ambition. Francis, the eldest of those who grew up, was born in 1519, and became the second duke; Charles, born in 1524, was the second cardinal of Lorraine, a man as intelligent and depraved as his uncle, and more vigorous and ambitious; Claude, the next, was created duke of Aumale; Louis, archbishop of Sens and cardinal of Guise; René, marquis of Elbeuf. The daughters made brilliant matches: above all, the eldest, Marie, widow of the duke of Longueville, was married in 1538 to James V. of Scotland, and had a stormy career as regent to her daughter, Mary Stuart, queen of Scots.

In his later days Claude of Guise withdrew somewhat from public life; he stood aloof from the intrigues of the reign, while the cardinal attached himself to the "black court," the court of Diana of Poitiers, and promoted the interests of his nephews without stint. From this time all leanings towards either Renaissance or reform were at an end: henceforth the Guises became the heads of the opposition to the Huguenots, the strength and support of the new Jesuit movement, and, later, the leaders of the League. Claude of Guise died in 1550, leaving his dignities to his son Francis, "le grand Guise," who had already won great credit for bravery, and had shown that dashing contempt for all rules of military prudence which gives a captain undying popularity. The ghastly wound in the face, which his rashness won for him in 1545 at the hands of the English near Boulogne, got him the name of the first "Balafré;" it was the outward symbol of his devotion to his country, and greatly raised his repute among the people. He had too the essential qualities of popularity, a majestic presence, and friendly manners in camp; he was chivalrous, liberal, humane, discerning. In 1552, as lieutenant-general in the three bishoprics, he withstood at the siege of Metz the last efforts of Charles V., and saved France from a terrible invasion. Thanks to the jealousy of the Montmorencies, he was sent in 1557 to conquer Naples, and would have added another to the long roll of reputations ruined by Italy, had he not been suddenly recalled to protect his country after the disaster of St. Quentin. With happy boldness, instead of watching the victorious allies, he suddenly attacked and took Calais, ending the English occupation of French soil, and raising his own renown to the highest point. Then, with his brother Charles, second cardinal of Lorraine, he wielded unlimited power throughout the reign of Francis II. Under Charles IX. his influence abated, and he withdrew into Alsace. On his return thence in 1562, he was, however unwillingly, for he was not inhumane, the cause of the massacre of Vassy, which began the civil wars. In the first war he won the battle of Dreux (1562), and thence passing southward besieged

pine, maple or cherry-wood being used for the sides and the back. The modern guitar, as already stated, has six strings, while the original *El Aūd* of the Arabs had only four, subsequently increased to five. They are tuned to the notes E, A, D, G, B natural, and E. In the more remote keys transposition by means of a *capo tasto*, or *nut*, is effected. In this manner a basis of flat instead of natural keys may be substituted without any change of fingering. In the East, especially in Arabia, India, China, and Japan, many varieties of the guitar and its congeners are in use, the number of strings varying from two to five. For the technique of the guitar Madame Sidney Pratten's treatise, *Learning the Guitar simplified*, may be consulted.

GUIZOT, FRANÇOIS PIERRE GUILLAUME (1787-1874), historian, orator, and statesman, was born at Nîmes on the 4th October 1787, of an honourable Protestant family belonging to the *bourgeoisie* of that city. It is characteristic of the cruel disabilities which still weighed upon the Protestants of France before the Revolution, that his parents, at the time of their union, could not be publicly or legally married by their own pastors, and that the ceremony was clandestine. The liberal opinions of his family did not, however, save it from the sanguinary intolerance of the Reign of Terror, and on the 8th April 1794 his father perished at Nîmes upon the scaffold. Thenceforth the education of the future minister devolved entirely upon his mother, a woman of slight appearance and of homely manners, but endowed with great strength of character and clearness of judgment. Madame Guizot was a living type of the French Huguenots of the 16th century, stern in her principles and her faith, immovable in her convictions and her sense of duty. She formed the character of her illustrious son and shared every vicissitude of his life. In the days of his power her simple figure, always clad in deep mourning for her martyred husband, was not absent from the splendid circle of his political friends. In the days of his exile in 1848 she followed him to London, and there at a very advanced age closed her life and was buried at Kensal Green. Driven from Nîmes by the Revolution, Madame Guizot and her son repaired to Geneva, where he received his education. In spite of her decided Calvinistic opinions, the theories of Rousseau, then much in fashion, were not without their influence on Madame Guizot. She was a strong liberal, and she even adopted the notion inculcated in the *Emile* that every man ought to learn a manual trade or craft. Young Guizot was taught to be a carpenter, and he so far succeeded in his work that he made a table with his own hands, which is still preserved at Val Richer by his children. Of the progress of his graver studies little is known, for in the work which he entitled *Memoirs of my own Times* Guizot omitted all personal details of his earlier life. But his literary attainments must have been precocious and considerable, for when he arrived in Paris in 1805 to pursue his studies in the faculty of laws, he entered at eighteen as tutor into the family of M. Stapfer, formerly Swiss minister in France, and he soon began to write in a journal edited by M. Suard, the *Publiciste*. This connexion introduced him to the literary society of Paris. In October 1809, being then twenty-two, he wrote a review of M. de Chateaubriand's *Martyrs*, which procured for him the approbation and cordial thanks of that eminent person, and he continued to contribute largely to the periodical press. At Suard's he had made the acquaintance of Mademoiselle de Meulan, an accomplished lady of good family, some fourteen years older than himself, who also was engaged to contribute a series of articles to Suard's journal. These contributions were interrupted by her illness, but immediately resumed and continued by an unknown hand. It was discovered

that François Guizot had quietly supplied the deficiency on her behalf. The acquaintance thus begun ripened into friendship and love, and in 1812 Mademoiselle de Meulan consented to marry her youthful ally. She was the mother of his eldest son, a young man of great promise, who died of consumption in 1837. Madame Guizot, his first wife, died in 1827; she was the authoress of many esteemed works on female education.

During this period of his life Guizot, entirely devoted to literary pursuits, published a collection of French synonyms (1809), an essay on the fine arts (1811), and a translation of Gibbon with additional notes in 1812. These works recommended him to the notice of M. de Fontanes, then grand-master of the university of France, and there was some question of attaching him in a subordinate office to the council of state. But on political subjects a radical antagonism existed between the young constitutional publicist and the spirit of the empire. This did not prevent M. de Fontanes from selecting Guizot for the chair of modern history in Paris in 1812. His first lecture, which is reprinted in his *Memoirs* was delivered on the 11th December of that year. The customary compliment to the all-powerful emperor he declined to insert in it, in spite of the hints given him by his patron. He had now acquired a considerable position in the society of Paris, and the friendship of Royer-Collard and the leading members of the liberal party, including the young Duc de Broglie. Absent from Paris at the moment of the fall of Napoleon in 1814, he was at once selected, on the recommendation of Royer-Collard, to serve the Government of Louis XVIII. in the capacity of secretary-general of the ministry of the interior, under the Abbé de Montesquiou. Upon the return of Napoleon from Elba he immediately resigned, on the 25th March 1815 (the statement that he retained office under General Carnot is incorrect), and returned to his literary pursuits. The liberal professions of the emperor during the Hundred Days, though backed by Benjamin Constant, did not for a moment impose on Guizot. He was convinced that Napoleon would never govern on liberal principles, and that his power could not last. He was equally convinced that a second restoration of the Bourbons was the only mode by which constitutional monarchy could be established in France. He therefore applied himself to promote that object, and repaired to Ghent, where he saw Louis XVIII., and in the name of the liberal party pointed out to his majesty that a frank adoption of a liberal policy could alone secure the duration of the restored monarchy—advice which was ill-received by M. de Blacas and the king's confidential advisers. This visit to Ghent, at the time when France was a prey to a second invasion, was made a subject of bitter reproach to Guizot in after life by his political opponents, as an unpatriotic action. "The Man of Ghent" was one of the terms of insult frequently hurled against him in the days of his power. But the reproach appears to be wholly unfounded. The true interests of France were not in the defence of the falling empire, but in establishing a liberal policy on a monarchical basis and in combating the reactionary tendencies of the ultra-royalists. It is at any rate a remarkable circumstance that a young professor of twenty-seven, with none of the advantages of birth or political experience, should have been selected to convey so important a message to the ears of the king of France, and a proof, if any were wanting, that the Revolution had, as Guizot said, "done its work."

On the second restoration Guizot resumed office as secretary-general of the ministry of justice under M. de Marbois, but this minister resigned in 1816, and the young statesman was promoted to the council of state and to the general directorship of the departmental and communal administration of the kingdom. But the reactionary spirit

of the chamber of deputies, of the royalist party, and of the successive Governments of Louis XVIII., was extremely opposed to the views of Guizot and his friends. Then it was that they endeavoured by their writings and by their speeches to apply broader principles of parliamentary government to France, and to found the party which was known by the title of the "Doctrinaires." The opinions of the doctrinaires had more of the rigour of a sect than the elasticity of a political party. Adhering to the great principles of liberty and toleration, they were sternly opposed to the anarchical traditions of the Revolution. They knew that the elements of anarchy were still fermenting in the country; these they hoped to subdue, not by reactionary measures, but by the firm application of the power of a limited constitution, based on the suffrages of the middle class and defended by the highest literary talent of the times. Their motives were honourable. Their views were philosophical. But they were opposed alike to the democratical spirit of the age, to the military traditions of the empire, and to the bigotry and absolutism of the court. The fate of such a party might be foreseen. They lived by a policy of resistance; they perished by another revolution. They are remembered more for their constant opposition to popular demands than by the services they undoubtedly rendered to the cause of temperate freedom.

In the eyes of this celebrated party, and in the sanguine spirit of the times, the French Revolution had run its course. It had exhausted the popular excesses of the convention and the military despotism of the empire. The victory of the Revolution over the arbitrary powers of the crown and the unjust privileges of the aristocracy was complete. Power was transferred to the middle classes of society, and their leaders hoped to establish on the basis of a limited suffrage all the essential rights and liberties of a free people. They hoped at the same time, by the diffusion of education amongst the people, to qualify them more and more for the exercise of these rights. They combated the reactionary and intolerant influence of the church. They opposed the high prerogative doctrines of the ministers of the crown. Their policy was described by the term "juste milieu"—a *via media* between royal authority and popular government. In those days none foresaw that they were building on the sand, and that before another generation had passed away, their scientific structure of government would crumble into ruins, and France would again traverse the dreary cycle of popular revolutions and imperial despotism. In 1821, when the reaction was at its height after the murder of the Duc de Berri, and the fall of the ministry of Duc Decazes, Guizot's relations to the Government of M. de Villele became decidedly hostile. He was deprived of all his offices, and in 1825 even his course of lectures was interdicted. During the five succeeding years he played an important part among the leaders of the liberal opposition to the Government of Charles X., although he had not yet entered parliament, and this was also the time of his greatest literary activity. Within this period he published his lectures on representative government; a work on capital punishment for political offences; a collection of memoirs of the history of England in 26 volumes, and of memoirs of the history of France in 31 volumes; and a revised translation of Shakespeare. The most remarkable work from his own pen was the first part of his *History of the English Revolution from the Accession of Charles I. to that of Charles II.*—a book of great merit and impartiality, which he resumed and completed during his exile in England after 1848. The Martignac administration restored Guizot in 1828 to his professor's chair and to the council of state. Then it was that he delivered the celebrated courses of lectures

which raised his reputation as an historian to the highest point of fame, and placed him amongst the best writers of France and of Europe. These lectures formed the basis of his general *History of Civilization in Europe*, and of his *History of Civilization in France*. Our space does not allow us to offer any remark on these well-known publications. But they must ever be regarded as classics of modern historical research, and precursors of the great advance in the treatment of modern history which has marked the last half century.

Hitherto Guizot's fame rested on his merits as a writer on public affairs and as a lecturer on modern history. He had attained the age of forty-three before he entered upon the full display of his oratorical strength. In January 1830 he was elected for the first time by the town of Lisieux to the chamber of deputies, and he retained that seat during the whole of his political life, that is, for eighteen years. The moment was critical for a representative of liberal principles and an aspirant for power. The Polignac ministry had engaged in a mortal contest between Charles X. and the national legislature, and the election of a popular man of letters by an important constituency was hailed as a triumph of the liberal cause.

Guizot immediately assumed an important position in the representative assembly, and the first speech he delivered was in defence of the celebrated address of the 221, in answer to the menacing speech from the throne, which was followed by the dissolution of the chamber, and was the precursor of another revolution. On his returning to Paris from Nîmes on the 27th July, the fall of Charles X. was already imminent. Guizot was called upon by his friends Casimir Périer, Laffitte, Villemain, and Dupin to draw up the protest of the liberal deputies against the royal ordinances of July, whilst he applied himself with them to control the revolutionary character of the late contest. Personally, Guizot was always of opinion that it was a great misfortune for the cause of parliamentary government in France that the infatuation and ineptitude of Charles X. and Prince Polignac rendered a change in the hereditary line of succession inevitable. The chamber of deputies assumed the powers of a convention, and placed the duke of Orleans on the throne. A ministry was formed under M. Laffitte, and although it comprised the great names of Count Molé, Marshal Gérard, Casimir Périer, and the Duc de Broglie, the department of the interior, then the most difficult and important in the state, was allotted to Guizot. Nor was his an inactive administration. The waves of the great tempest which had just passed over France were to be stilled, the lives of the fallen ministers to be saved, stability to be given to the throne, confidence in the maintenance of peace to Europe; and, although the Laffitte cabinet was of short duration, these objects were attained. In 1831 Casimir Périer formed a more vigorous and compact administration, which was terminated in May 1832 by his death; the summer of that year was marked by a formidable republican rising in Paris, and it was not till the 11th October 1832 that a stable Government was formed, in which Marshal Soult was first minister, the Duc de Broglie took the foreign office, Thiers the home department, and Guizot contented himself with the department of public instruction. This ministry, which lasted for nearly four years, was by far the ablest and most comprehensive that ever served Louis Philippe; it combined men of the highest talents and character, and it rendered incalculable services to the nation and the crown. Guizot, however, was already marked with the stigma of unpopularity by the more advanced liberal party. He remained unpopular all his life, "not," said he, "that I court unpopularity, but that I think nothing about it." Yet never were his great abilities more useful to his

country than whilst he filled this office of secondary rank but of primary importance in the department of public instruction. The duties it imposed on him were entirely congenial to his literary tastes, and he was master of the subjects they concerned. He applied himself in the first instance to carry a large measure for the education of the people, and to a great extent founded the existing educational establishments of the people of France. In fifteen years, under the influence of this law, the number of primary schools rose from ten to twenty-three thousand; normal schools for teachers, and a general system of inspection, were introduced; and boards of education, under mixed lay and clerical authority, were created. The secondary class of schools and the university of France were equally the subject of his enlightened protection and care, and a prodigious impulse was given to philosophical study and historical research. The branch of the Institute of France known as the "Académie des Sciences Morales et Politiques," which had been suppressed by Napoleon, was revived by Guizot. Some of the old members of this learned body—Talleyrand, Siéyès, Rœderer, and Lakanal—again took their seats there, and a host of more recent celebrities were added by election for the free discussion of the great problems of political and social science. The "Société de l'Histoire de France" was founded for the publication of historical works; and a vast publication of mediæval chronicles and diplomatic papers was undertaken at the expense of the state.

The object of the cabinet of October 1832 was to organize a conservative party, and to carry on a policy of resistance to the republican faction which threatened the existence of the monarchy. It was their pride and their boast that their measures never exceeded the limits of the law, and by the exercise of legal power alone they put down an insurrection amounting to civil war in Lyons and a sanguinary revolt in Paris. The real strength of the ministry lay not in its nominal heads, but in the fact that in this Government and this alone Guizot and Thiers acted in cordial cooperation. The two great rivals in French parliamentary eloquence followed for a time the same path; but neither of them could submit to the supremacy of the other, and circumstances threw Thiers almost continuously on a course of opposition, whilst Guizot bore the graver responsibilities of power.

Once again indeed, in 1839, they were united, but it was in opposition to M. Molé, who had formed an intermediate Government, and this coalition between Guizot and the leaders of the left centre and the left, Thiers and Odilon Barrot, is justly regarded as one of the chief inconsistencies of his life. Victory was secured at the expense of principle; but none of the three chiefs of that alliance took ministerial office, and Guizot was not sorry to accept the post of ambassador in London, which withdrew him for a time from parliamentary contests. This was in the spring of 1840, and Thiers succeeded shortly afterwards to the ministry of foreign affairs.

Guizot was received with marked distinction by the queen and by the society of London. His literary works were highly esteemed, his character was respected, and France was never more worthily represented abroad than by one of her greatest orators. He was known to be well-versed in the history and the literature of England, and sincerely attached to the alliance of the two nations and the cause of peace. But, as he himself remarked, he was a stranger to England and a novice in diplomacy; and unhappily the embroiled state of the Syrian question, on which the French Government had separated itself from the joint policy of Europe, and possibly the absence of entire confidence between the ambassador and the minister of foreign affairs, placed him in an embarrassing and even

false position. The warnings he transmitted to Thiers were not believed. The warlike policy of Thiers was opposed to his own convictions. The treaty of the 15th July was signed without his knowledge and executed in the teeth of his remonstrances. For some weeks Europe seemed to be on the brink of war, until the king put an end to the crisis by refusing his assent to the military preparations of Thiers, and by summoning Guizot from London to form a ministry and to aid his Majesty in what he termed "ma lutte tenace contre l'anarchie." Thus began, under dark and adverse circumstances, on the 29th October 1840, the important administration in which Guizot remained the master-spirit for nearly eight years. He himself took the office of minister for foreign affairs, to which he added some years later, on the retirement of Marshal Soult, the ostensible rank of prime minister. His first care was the maintenance of peace and the restoration of amicable relations with the other powers of Europe. If he succeeded, as he did succeed, in calming the troubled elements and healing the wounded pride of France, the result was due mainly to the indomitable courage and splendid eloquence with which he faced a raging opposition, gave unity and strength to the conservative party, who now felt that they had a great leader at their head, and appealed to the thrift and prudence of the nation, rather than to their vanity and their ambition. In his pacific task he was fortunately seconded by the formation of Sir Robert Peel's administration in England, in the autumn of 1841. Between Lord Palmerston and Guizot there existed unhappily an incompatibility of character exceedingly dangerous in the foreign ministers of two great and in some respects rival countries. With Lord Palmerston in office, Guizot felt that he had a bitter and active antagonist in every British agent throughout the world; the combative element was strong in his own disposition; and the result was a system of perpetual conflict and counter-intrigues. Lord Palmerston held (as it appears from his own letters) that war between England and France was, sooner or later, inevitable. Guizot held that such a war would be the greatest of all calamities, and certainly never contemplated it. In Lord Aberdeen, the foreign secretary of Sir Robert Peel, Guizot found a friend and an ally perfectly congenial to himself. Their acquaintance in London had been slight, but it soon ripened into mutual regard and confidence. They were both men of high principles and honour; the Scotch Presbyterianism which had moulded the faith of Lord Aberdeen was reflected in the Huguenot minister of France; both were men of extreme simplicity of taste, joined to the refinement of scholarship and culture; both had an intense aversion to war and felt themselves ill-qualified to carry on those adventurous operations which inflamed the imagination of their respective opponents. In the eyes of Lord Palmerston and Thiers their policy was mean and pitiful; but it was a policy which secured peace to the world, and united the two great and free nations of the West in what was termed the *entente cordiale*. Neither of them would have stooped to snatch an advantage at the expense of the other; they held the common interest of peace and friendship to be paramount; and when differences arose, as they did arise, in remote parts of the world,—in Tahiti, in Morocco, on the Gold Coast,—they were reduced by this principle to their proper insignificance. The opposition in France denounced Guizot's foreign policy as basely subservient to England. He replied in terms of unmeasured contempt,—"You may raise the pile of calumny as high as you will; vous n'arriverez jamais à la hauteur de mon dédain!" The opposition in England attacked Lord Aberdeen with the same reproaches, but in vain. King Louis Philippe visited Windsor. The queen of England (in 1843) stayed at the

Château d'Eu. In 1845 British and French troops fought side by side for the first time in an expedition to the River Plate.

The fall of Sir Robert Peel's Government in 1846 changed these intimate relations; and the return of Lord Palmerston to the foreign office led Guizot to believe that he was again exposed to the passionate rivalry of the British cabinet. A friendly understanding had been established at Eu between the two courts with reference to the future marriage of the young queen of Spain. The language of Lord Palmerston and the conduct of Sir Henry Bulwer at Madrid led Guizot to believe that this understanding was broken, and that it was intended to place a Coburg on the throne of Spain. Determined to resist any such intrigue, Guizot and the king plunged headlong into a counter-intrigue, wholly inconsistent with their previous engagements to England, and fatal to the happiness of the queen of Spain. By their influence she was urged into a marriage with a despicable offset of the house of Bourbon, and her sister was at the same time married to the youngest son of the French king, in direct violation of Louis Philippe's promises. This transaction, although it was hailed at the time as a triumph of the policy of France, was in truth as fatal to the monarch as it was discreditable to the minister. It was accomplished by a mixture of secrecy and violence. It was defended by subtleties. By the dispassionate judgment of history it has been universally condemned. Its immediate effect was to destroy the Anglo-French alliance, and to throw Guizot into closer relations with the reactionary policy of Metternich and the Northern courts.

The history of Guizot's administration, the longest and the last which existed under the constitutional monarchy of France, bears the stamp of the great qualities and the great defects of his political character, for he was throughout the master-spirit of that Government. His first object was to unite and discipline the conservative party, which had been broken up by previous dissensions and ministerial changes. In this he entirely succeeded by his courage and eloquence as a parliamentary leader, and by the use of all those means of influence which France too liberally supplies to a dominant minister. No one ever doubted the purity and disinterestedness of Guizot's own conduct. He despised money; he lived and died poor; and though he encouraged the fever of money-getting in the French nation, his own habits retained their primitive simplicity. But he did not disdain to use in others the baser passions from which he was himself free. Some of his instruments were mean; he employed them to deal with meanness after its kind. Gross abuses and breaches of trust came to light even in the ranks of the Government, and under an incorruptible minister the administration was denounced as corrupt. *Licet uti alieno vitio* is a proposition as false in politics as it is in divinity.

Of his parliamentary eloquence it is impossible to speak too highly. It was terse, austere, demonstrative, and commanding,—not persuasive, not humorous, seldom adorned, but condensed with the force of a supreme authority in the fewest words. He has been heard to say that he seldom had occasion to address the chambers for more than twenty minutes at a time, except when despatches were read. The consequence was that the audience hung upon his words with breathless attention. Not a syllable, not an inflexion of the voice was lost,—nothing was repeated; and when he ceased, it seemed as if the waves of an ocean had been spell-bound by his voice. He was essentially a ministerial speaker, far more powerful in defence than in opposition. Like Pitt he was the type of authority and resistance, unmoved by the brilliant charges, the wit, the gaiety, the irony, and the discursive power of his great rival. Nor was he less a master of parliamentary tactics,

and of those sudden changes and movements in debate, which, as in a battle, sometimes change the fortune of the day. His confidence in himself, and in the majority of the chamber which he had moulded to his will, was unbounded; and long success and the habit of authority led him to forget that in a country like France there was a people outside the chamber elected by a small constituency, to which the minister and the king himself were held responsible.

A Government based on the principle of resistance and repression and marked by dread and distrust of popular power, a system of diplomacy which sought to revive the traditions of the old French monarchy, a sovereign who largely exceeded the bounds of constitutional power and whose obstinacy augmented with years, a minister who, though far removed from the servility of the courtier, was too obsequious to the personal influence of the king, were all singularly at variance with the promises of the Revolution of July, and they narrowed the policy of the administration. Guizot's view of politics was essentially historical and philosophical. His tastes and his acquirements gave him little insight into the practical business of administrative government. Of finance he knew nothing; trade and commerce were strange to him, and he has been heard to express astonishment at the paramount importance Sir Robert Peel attached to his commercial policy; military and naval affairs were unfamiliar to him; all these subjects he dealt with by second hand through his friends Dumon, Duchâtel, or Marshal Bugeaud. The consequence was that few measures of practical improvement were carried by his administration. Still less did the Government lend an ear to the cry for parliamentary reform. On this subject the king's prejudices were insurmountable, and his ministers had the weakness to give way to them. Being asked after the Revolution of 1848 whether he thought the action and extra-constitutional influence of King Louis Philippe had been beneficial or injurious to the monarchy, Guizot replied that in the earlier years of the king's reign it had been of great use in strengthening the government and restoring order, but that in the later years it had been injurious to constitutional government and to the monarchy itself. It obviously drew down upon the king that responsibility which should have rested entirely on his ministers; and on the question of reform he was even more to be blamed than they were. It was impossible to defend a system which confined the suffrage to 200,000 citizens, and returned a chamber of whom half were placemen. Nothing would have been easier than to strengthen the conservative party by attaching to the suffrage to the possession of land in France, but blank resistance was the sole answer of the Government to the just and moderate demands of the opposition. Warning after warning was addressed to them in vain by friends and by foes alike; and they remained profoundly unconscious of their danger till the moment when it overwhelmed them. It was the old old story of a hopeless conflict between a court, obstinately addicted to an effete theory of government, and the rising will of a nation, when a little timely and honest concession would have arrested the catastrophe. Strange to say, Guizot never acknowledged either at the time or to his dying day the nature of this error; and he speaks of himself in his memoirs as the much enduring champion of liberal government and constitutional law. He utterly fails to perceive that a more enlarged view of the liberal destinies of France and a less intense confidence in his own specific theory might have preserved the constitutional monarchy and averted a vast series of calamities, which were in the end fatal to every principle he most cherished. But with the stubborn conviction of absolute truth he dauntlessly adhered to his own doctrines to the end. The last scene of his political life was singularly characteristic

of his inflexible adherence to a lost cause. In the afternoon of February 23, 1818, the king summoned his minister from the chamber, which was then sitting, and informed him that the aspect of Paris and the country during the banquet agitation for reform, and the alarm and division of opinion in the royal family, led him to doubt whether he could retain his ministry. That doubt, replied Guizot, is decisive of the question, and instantly resigned, returning to the chamber only to announce that the administration was at an end, and that Molé had been sent for by the king. Molé failed in the attempt to form a Government, and between midnight and one in the morning Guizot, who had according to his custom retired early to rest, was again sent for to the Tuileries. The king asked his advice. "We are no longer the ministers of your Majesty," replied Guizot; "it rests with others to decide on the course to be pursued. But one thing appears to be evident: this street riot must be put down; these barricades must be taken; and for this purpose my opinion is that Marshal Bugeaud should be invested with full power, and ordered to take the necessary military measures, and as your Majesty has at this moment no minister, I am ready to draw up and countersign such an order." The marshal, who was present, undertook the task, saying, "I have never been beaten yet, and I shall not begin to-morrow. The barricades shall be carried before dawn." After this display of energy the king hesitated, and soon added: "I ought to tell you that M. Thiers and his friends are in the next room forming a Government!" Upon this Guizot rejoined, "Then it rests with them to do what they think fit," and left the palace. Thiers and Barrot decided to withdraw the troops. The king and Guizot next met at Claremont. This was the most perilous conjuncture of Guizot's life, but fortunately he found a safe refuge in Paris for some days in the lodging of a humble miniature painter whom he had befriended, and shortly afterwards effected his escape across the Belgian frontier and thence to London, where he arrived on the 3d March. His mother and daughters had preceded him, and he was speedily installed in a modest habitation in Pelham Crescent, Brompton.

The society of England, though many persons disapproved of much of his recent policy, received the fallen statesman with as much distinction and respect as they had shown eight years before to the king's ambassador. Sums of money were placed at his disposal, which he declined. A professorship at Oxford was spoken of, which he was unable to accept. His old friends resumed their relations with him. For himself, serene and undisturbed by a catastrophe which had shaken Europe, he immediately collected a few books and resumed the narrative of the British commonwealth, until he brought it down to Monk and Richard Cromwell.

Guizot survived the fall of the monarchy and the government he had served twenty-six years. He passed abruptly from the condition of one of the most powerful and active statesmen in Europe to the condition of a philosophical and patriotic spectator of human affairs. He was aware that the link between himself and public life was broken for ever; and he never made the slightest attempt to renew it. He was of no party, a member of no political body; no murmur of disappointed ambition, no language of asperity, ever passed his lips; it seemed as if the fever of oratorical debate and ministerial power had passed from him and left him a greater man than he had been before, in the pursuit of letters, in the conversation of his friends, and as head of the patriarchal circle of those he loved. The greater part of the year he spent at his residence at Val Richer, an Augustine monastery near Lisieux in Normandy, which had been sold at the time of the first

Revolution. His two daughters, who married two descendants of the illustrious Dutch family of De Witt, so congenial in faith and manners to the Huguenots of France, kept his house. One of his sons-in-law farmed the estate. And here Guizot devoted his later years with undiminished energy to literary labour, which was in fact his chief means of subsistence. Proud, independent, simple, and contented he remained to the last; and these years of retirement were perhaps the happiest and most serene portion of his life.

Two institutions may be said even under the second empire to have retained their freedom—the Institute of France and the Protestant Consistory. In both of these Guizot continued to the last to take an active part. He was a member of three of the five academies into which the Institute of France is divided. The Academy of Moral and Political Science owed its restoration to him, and he became in 1832 one of its first associates. The Academy of Inscriptions and Belles Lettres elected him in 1833 as the successor to M. Dacier; and in 1836 he was chosen a member of the French Academy, the highest literary distinction of the country. In these learned bodies Guizot continued for nearly forty years to take a lively interest and to exercise a powerful influence. He was the jealous champion of their independence. His voice had the greatest weight in the choice of new candidates; the younger generation of French writers never looked in vain to him for encouragement; and his constant aim was to maintain the dignity and purity of the profession of letters.

In the consistory of the Protestant church in Paris Guizot exercised a similar influence. His early education and his experience of life conspired to strengthen the convictions of a religious temperament. He remained through life a firm believer in the truths of revelation, and a volume of *Meditations on the Christian Religion* was one of his latest works. But though he adhered inflexibly to the church of his fathers and combated the rationalist tendencies of the age, which seemed to threaten it with destruction, he retained not a tinge of the intolerance or asperity of the Calvinistic creed. He respected in the Church of Rome the faith of the majority of his countrymen; and the writings of the great Catholic prelates, Bossuet and Bourdaloue, were as familiar and as dear to him as those of his own persuasion, and were commonly used by him in the daily exercises of family worship.

In these literary pursuits and in the retirement of Val Richer years passed smoothly and rapidly away; and as his grandchildren grew up around him, he began to direct their attention to the history of their country. From these lessons sprang his last and not his least work, the *Histoire de France racontée à mes petits enfants*, for although this publication assumed a popular form, it is not less complete and profound than it is simple and attractive. The work extends to five large volumes, and has been brought down to the present time by his accomplished daughter Madame Guizot de Witt, from her father's notes.

Down to the summer of 1874 Guizot's mental vigour and activity were unimpaired. His frame, temperate in all things, was blessed with a singular immunity from infirmity and disease; but in the month of September of that year the vital power ebbed away, and he passed gently, reciting now and then a verse of Corneille or a text of Scripture, into his rest.

Public life, ambition, the love of power, and the triumph of debate no doubt shook and agitated his career, and sometimes misdirected it; but they produced no effect upon the solid structure of his character, which remained throughout perfectly simple, indifferent to wealth, and prouder of its own integrity than of all the honour the world could bestow. M. Guizot will be remembered in history less by

what he did as a politician than by what he wrote as a man of letters, and by what he was as a man; and in these respects he takes rank amongst the most illustrious representatives of his nation and his age. (H. R.)

GUJARAT. See GUZERAT.

GUJRÁNWÁLA, a British district in the Punjab, lying between 31° 32' and 32° 33' N. lat., and between 73° 11' 30" and 74° 28' 15" E. long., with an area (1877) of 2563 square miles, and population (1868) of 550,576. It is bounded on the N.W. by the river Chenáb, on the S. and S.E. by the districts of Jhang and Lahore, and on the E. by the district of Siálkot. This district forms the central portion of the Rechna Doáb, intermediate between the fertile submontane plains of Siálkot and the desert expanses of Jhang. On the northern frontier, a belt of alluvial land, some 2 to 6 miles in breadth, fringes the Chenáb throughout its course. The southern portion of the plateau has a rich soil, with accessible water; the villages here lie close together, while the people are careful and industrious cultivators. But further south the ground becomes harder and drier until in the extreme south the *bár*, a flat expanse of barren land, passes slowly into the desert of Jhang. In the south-east corner of the district, the little river Degh irrigates and fertilizes a tiny valley of its own. Two or three minor watercourses are used for the purposes of irrigation in the villages through which they pass. The country is very bare of trees, and the scenery throughout is tame and in the central plateau becomes very monotonous.

The district of Gujránwála is essentially a modern one; yet it can claim considerable relics of the past, constructed during an early period of prosperity. It seems likely that the district once contained the capital of the Punjab, at an epoch when Lahore had not begun to exist. We learn from the Chinese Buddhist pilgrim, Hiouen Tshang, that about the year 630 he visited a town known as Tse-kiá (or Táki), the metropolis of the whole country of the five rivers. A mound near the modern village of Asazur has been identified as the site of the ancient capital. Until the Mahometan invasions little is known of Gujránwála except that Táki had fallen into oblivion and Lahore had become the chief city. Under Mahometan rule the district flourished for a time; but a mysterious depopulation fell upon the tract, and the whole region seems to have been almost entirely abandoned. At the first beginning of the Sikh war, the waste plains of Gujránwála were seized by various military adventurers. Charat Singh took possession of the village of Gujránwála, and here his grandson the great mahárájá Ranjít Singh was born. The Sikh rule, which was elsewhere so disastrous, appears to have been an unmitigated benefit to this district. Ranjít Singh settled large colonies in the various villages, and encouraged cultivation throughout the depopulated plain. In 1847 the district came under British influence, in connexion with the regency at Lahore; and in 1849 it was included in the territory annexed after the second Sikh war. Since that time Gujránwála has enjoyed an immunity from the catastrophes of history, with the exception of the events of 1857, which belong to the general annals of India.

The population in 1868 numbered 550,576 persons,—306,296 males and 244,280 females. In religion, the district is mainly Mahometan. There were five towns, namely, Gujránwála, Wazirábád, Rámnagar, Eminábád, and Akalgarh, with a population aggregating 54,458 persons. The total cultivated area of the district amounts to 567,849 acres, while the cultivable margin reaches the high figure of 701,761 acres. The staple crop is wheat, which occupies one-third of the cultivated area. The other products are—barley, gram, tobacco, oil-seeds, vegetables, rice, Indian corn, pulses, cotton, and sugarcane. Irrigation is very general, 327,832 acres being artificially watered. The trade of the district is unimportant. The chief exports are agricultural produce, brass vessels, leathern bottles, and timber. The imports consist of salt, iron, cattle, spices, and English piece-goods. A great religious fair is held at Dhonkal.

The principal channel of communication is the Northern State Railway from Lahore to Pesháwar. The Grand Trunk road, connecting the same two places, traverses the district for 42 miles. There are 1055 miles of unmetalled road in Gujránwála, besides a number of local by-ways. The Chenáb is navigable throughout for the boats of the country. The revenue in 1871 was £53,560. In 1872-73 the district contained 12 civil and 19 magisterial courts. The total police force numbered 523 men, supplemented by 1092 village watchmen. Education is still very backward; the pupils in 1873 numbered in all 5818, maintained at a cost of £2369. The mean monthly temperature in 1867 ranged from 53° in January to 95° in June. The average rainfall for the eleven years ending 1867 was 24 inches. The prevalent diseases are intermittent fever and small-pox. The death-rate in 1872 amounted to 12,592, or 23 per thousand of the population.

GUJRÁNWÁLA, the chief town and administrative headquarters of the above district, in 32° 9' 30" N. lat. and 74° 14' E. long., with a population in 1868 of 19,381. The town is situated on the Grand Trunk road and Northern State Railway, 40 miles north of Lahore. It is of modern creation, and owes its importance to the father and grandfather of Mahárájá Ranjít Singh, whose capital it formed during the early period of the Sikh power. There is a mausoleum to Máhau Singh, father of Ranjít Singh, and a lofty cupola covers a portion of the ashes of the mahárájá himself. The civil station lies a mile south-east of the native town. It contains the court-house, treasury, jail, dispensary, post-office, staging bungalow, and church.

GUJRÁT, or GOOJRAT, a British district in the Punjab, lying between 32° 10' 30" and 33° N. lat., and between 73° 20' and 74° 31' E. long.; area (1877), 2029 square miles; population (1868), 616,347 souls. It is bounded on the N.E. by the native state of Kashmir, on the N.W. by the river Jhám, on the W. by Shahpur district, and on the S.E. by the rivers Távi and Chenáb. The district of Gujrát comprises a narrow wedge of sub-Himálayan plain country, possessing few natural advantages. From the basin of the Chenáb on the south the general level rises rapidly towards the interior, which, owing to the great distance of the water beneath the surface, assumes a dreary and desert aspect. A range of low hills, known as the Pabbi, traverses the northern angle of Gujrát. They are composed of a friable Tertiary sandstone and conglomerate, totally destitute of vegetation, and presenting to the view a mere barren chaos of naked rock, deeply scored with precipitous ravines. Immediately below the Pabbi stretches a high plateau, terminating abruptly in a precipitous bluff some 200 feet in height. At the foot of this plateau is a plain, which forms the actual valley of the Chenáb and participates in the irrigation from the river bed. The district as a whole is well wooded, and great attention has been paid to arboriculture.

Numerous relics of antiquity stud the surface of Gujrát district. Mounds of ancient construction yield numbers of early coins, and bricks are found whose size and type prove them to belong to the prehistoric period of Hindu architecture. A mound now occupied by the village of Moga or Mong has been identified as the site of Nicæa, the city built by Alexander the Great on the field of his victory over Porus. The Delhi empire established its authority in this district under Ballool Lodi (1450-1488). A century later it was visited by Akbar, who founded Gujrát as the seat of government. During the decay of the Mughal power, the Ghakkars of Rawal Pindi overran this portion of the Punjab and established themselves in Gujrát about 1741. Meanwhile the Sikh power had been asserting itself in the eastern Punjab, and in 1765 the Ghakkar chief was defeated by Sardar Gújar Singh, chief of the Bhangi confederacy. On his death, his son succeeded him, but after a few months' warfare, in 1798, he submitted himself as vassal to the mahárájá Ranjít Singh. In 1846 Gujrát first came under the supervision of British officials. Two years

later the district became the theatre for the important engagements which decided the event of the second Sikh war. After several bloody battles in which the British were unsuccessful, the Sikh power was irretrievably broken at the engagement which took place at Gujrat on the 22d of February 1849. The Punjab lay at the feet of the conquerors, and passed by annexation under British rule.

The census of 1863 disclosed a population of 616,347 persons,—331,919 males, and 284,428 females,—of whom 537,696 were Mahometans, 53,174 Hindus, and 20,653 Sikhs. In 1875-76 the district contained four municipal towns with a population exceeding 5000—Gujrat, 17,391; Jalalpur, 14,022; Kunjah, 5354; and Dinga, 5077. Wheat forms the staple product of the district, while barley, gram, rice, pulses, oil-seeds, and cotton also cover considerable areas. Of the 708,863 acres under cultivation, 267,893 acres are provided with artificial irrigation. The chief exports are grain, *ghi*, wool, and other agricultural produce. The imports come chiefly from Lahore, Amritsar, Jammu, and Pind Dadan Khan. The Northern State Railway passes through the district from south-east to north-west, and affords a new outlet for traffic. Good branch lines of road connect Gujrat with all surrounding centres. The revenue in 1875-76 was £64,425. In the same year there were 11 civil and revenue judges. The police force (1875-76) numbered 514 men, supplemented by a body of 620 village watchmen. The number of state-supported schools amounted to 47 in 1875-76, having a joint roll of 3600 pupils. The cost of education is returned at £1618. The district school at Gujrat ranks as one of the eight "higher class" schools of the Punjab. Gujrat bears the reputation of being a healthy district; small-pox, fever, and ague occasionally prevail. The death rate (1875-76) was 18 per thousand of the population. The district contains 6 charitable dispensaries, giving relief in 1875 to 31,788 persons. The annual average rainfall during eight years ending 1873-74 was 28.5 inches. The fall is regular, and the district on the whole does not suffer much from drought.

GUJRAT, the chief town and administrative headquarters of the above district, in 32° 34' 30" N. lat. and 74° 7' 15" E. long., with a population of 17,391, stands upon an ancient site, formerly occupied, according to tradition, by two successive cities, the second of which is supposed to have been destroyed in 1303, the year of an early Mughal invasion of Delhi. Nearly 200 years later Sher Shah turned his attention to the surrounding country, and either he or Akbar founded the existing town. Though standing in the midst of a Jat neighbourhood, the fort was first garrisoned by Gijars, and took the name of Gujrat Akbarabad. The town was rendered memorable during the second Sikh war by the battle which takes its name from this site, and which decided the fate of the campaign, bringing the whole Punjab at once under British rule. Akbar's fort, largely improved by Gijjar Singh, stands in the centre of the town. The civil station lies to the north of the native city, and contains the court-house, treasury, jail, dispensary, police-lines, staging bungalow, and post-office. The trade of Gujrat is inconsiderable.

GULF STREAM. See ATLANTIC.

GULL (Welsh, *Gwylan*; French, *Goeland*), the name commonly adopted, to the almost entire exclusion of the old English MEW (Icelandic, *Máfur*; Danish, *Maage*; Swedish, *Måse*; German, *Meve*; Dutch, *Meeuw*; French, *Mouette*), for a group of Sea-birds widely and commonly known, all belonging to the genus *Larus* of Linnæus, which subsequent systematists have broken up in a very arbitrary and often absurd fashion. The Family *Laridae* is composed of two chief groups, *Larinae* and *Sterninae*—the Gulls and the Terns, though two other Subfamilies are frequently counted, the Skuas (*Stercorariinae*), and that formed by the single genus *Rhynchops*; the Skimmers; but there seems no strong reason why the former should not be referred to the *Larinae* and the latter to the *Sterninae*.

Taking the Gulls in their restricted sense, Mr Howard Saunders, who has lately subjected the group to a rigorous revision (*Proc. Zool. Society*, 1878, pp. 155-211), admits forty-nine species of them, which he places in five genera instead of the many which some prior investigators had sought to establish. Of the genera recognized by him,

Pagophila and *Rhodostethia* have but one species each, *Rissa* and *Xema* two, while the rest belong to *Larus*. The *Pagophila* is the so-called Ivory-Gull, *P. eburnea*, names which hardly do justice to the extreme whiteness of its plumage, to which its jet-black legs offer a strong contrast. The young, however, are spotted with black. An inhabitant of the most northern seas, examples, most commonly young birds of the year, find their way in winter to more temperate shores. Its breeding-place has seldom been discovered, and the first of its eggs ever seen by ornithologists was brought home by Sir L. M'Clintock in 1853 from Cape Krabbe (*Journ. R. Dubl. Society*, i. p. 60, pl. 1); others were subsequently obtained by Dr Malmgren in Spitzbergen. Of the species of *Rissa*, one is the abundant and well-known Kittiwake, *R. tridactyla*, of circumpolar range, breeding, however, also in comparatively low latitudes, as on the coasts of Britain, and in winter frequenting southern waters. The other is *R. brevirostris*, limited to the North Pacific, between Alaska and Kamchatka. The singular fact requires to be noticed that in both these species the hind toe is generally deficient, but that examples of each are occasionally found in which this functionless member has not wholly disappeared. We have then the genus *Larus*, which ornithologists have hitherto attempted most unsuccessfully to subdivide. It contains the largest as well as the smallest of Gulls. In some species the adults assume a dark-coloured head every breeding-season, in others any trace of dark colour is the mark of immaturity. The larger species prey fiercely on other kinds of birds, while the smaller content themselves with a diet of insects and worms. But however diverse be the appearance, structure, or habits of the extremities of the series of species, they are so closely connected by intermediate forms that it is hard to find a gap between them that would justify a generic division. Of the forty-three species of this genus recognized by Mr Saunders it would be impossible within the limits of this article to attempt to point out the peculiarities. About fifteen belong to Europe and fourteen to North America, of which (excluding stragglers) some five only are common to both countries. Our knowledge of the geographical distribution of several of them is still incomplete. Some have a very wide range, others very much the reverse, as witness *L. fuliginosus*, believed to be confined to the Galapagos, and *L. scopulinus* and *L. bulleri* to New Zealand,—the last indeed perhaps only to the South Island. The largest species of the group are the Glaucous and Greater Black-backed Gulls, *L. glaucus* and *L. marinus*, of which the former is circumpolar, and the latter nearly so—not being hitherto found between Labrador and Japan. The smallest species is the European *L. minutus*, though the North-American *L. philadelphia* does not much exceed it in size. Many of the Gulls congregate in vast numbers to breed, whether on rocky cliffs of the sea-coast or on heathy islands in inland waters. Some of the settlements of the Black-headed or "Peewit" Gull, *L. ridibundus*, are a source of no small profit to their proprietors,—the eggs, which are rightly accounted a great delicacy, being taken on an orderly system up to a certain day, and the birds carefully protected. Ross's or the Roseate Gull, *Rhodostethia rosea*, forms a well-marked genus, distinguished not so much by the pink tint of its plumage (for that is found in other species) but by its small Dove-like bill and wedge-shaped tail. It is an exceedingly scarce bird, little more than a dozen examples being known to exist in collections. Beyond its having an Arctic habitat, little has yet been ascertained about it. More rare still is one of the species of *Xema*, *X. furcatum*, of which only two specimens, both believed to have come from the Galapagos, have been seen. Its smaller congener Sabine's Gull, *X. sabinii*, is more common, and has been found breeding both in Arctic America and

in Siberia, and several examples, chiefly immature birds, have been obtained in the British Islands. Both species of *Xema* are readily distinguished from all other Gulls by their forked tails.

(A. N.)

GUM exists in the juices of almost all plants, but is produced in its purest form by various species of *Acacia*, e.g., *Acacia Verek* (Guil. and Perrottet), *A. horrida*, *A. arabica* (Willdenow), *A. Seydel* (Delile), and *A. stenocarpa* (Echsch.). The name is applied to those exudations from plants, stems, branches, or fruits which are entirely soluble or soften in water, and form with it a thick glutinous liquid or mucilage insoluble in alcohol of 60 per cent., and yield mucic and oxalic acids when treated with nitric acid. In structure gum is quite amorphous, being neither organized like starch nor crystallized like sugar. According to Trecul, the acacias and the *Rosaceae* yield their gums most abundantly when sickly and in an abnormal state, caused by a fulness of sap in the young tissues, whereby the new cells are softened and finally disorganized; the cavities thus formed fill with liquid, which exudes, dries, and constitutes the gum.

The chief varieties have hitherto been divided as follows:—(1) gum arabic, (2) gum tragacanth, (3) cherry tree gum, (4) gum of Bassora, (5) mucilage. The artificial gum dextrin has been already treated of, vol. vii. p. 146.

Gum Arabic may be taken as the type of the gums entirely soluble in water. The principal kinds are distinguished as Turkey Picked Gum, Gedda, Amrad, Gheziri, Senegal, Talca, Australian, Barbary, Cape, and East India (from Bombay and Aden). Another variety, spoken of as likely, from its abundance, to be soon in the market, is obtained from the *Prosopis dulcis*, a leguminous plant, and is called gum mesquite or mezquite; it comes from Western Texas and Mexico, and is yellowish in colour, very brittle, and quite soluble in water (*Pharm. Journ.* (3), vol. vi. p. 942).

Gum arabic occurs in pieces of varying size, and some kinds are full of minute cracks. The specific gravity of Turkey picked gum (the purest variety) is 1.487, or, when dried at 100° C., 1.525. It is soluble in water to an indefinite extent; boiled with dilute sulphuric acid it is converted first into dextrin, and then into a fermentable variety of sugar. Moderately strong nitric acid changes it into mucic, saccharic, tartaric, and oxalic acids. Under the influence of yeast it does not enter into the alcoholic fermentation, but Berthelot, by digesting with chalk and cheese, obtained from it 12 per cent. of its weight of alcohol, along with lactate of calcium, but no appreciable quantity of sugar. According to Frémy, gum arabic may be regarded as a potassium and calcium salt of guamic or arabic acid, of the formula $\text{CaK}_2\text{C}_{12}\text{H}_{32}\text{O}_{11} \cdot 6\text{C}_{12}\text{H}_{22}\text{O}_{11}$. Graham (*Chemical and Physical Researches*) gives dialysis as the simplest and best mode of preparing gummic acid, and states that the power of gum to penetrate the colloid septum is 400 times less than that of chloride of sodium, and further that by mixing the gum with substances of the crystalloid class the diffusibility is lowered, and may be even reduced to nothing. The mucilage must be acidulated with hydrochloric acid before dialysing, to set free the gummic acid. Gummic acid reddens litmus, its reaction being about equal to carbonic acid. When solutions of gum arabic and gelatin are mixed, oily drops of a compound of the two are precipitated, which on standing form a nearly colourless jelly, melting at 25° C., or by the heat of the hand. This substance can be washed without decomposition. Gummic acid is soluble in water; when well dried at 100° C., it becomes transformed into metagummic acid, which is insoluble, but swells up in water like gum tragacanth.

Gum arabic, when heated to 150° C. with two parts of acetic anhydride, swells up to a mass which, when washed with boiling water, and then with alcohol, gives a white amorphous insoluble powder called acetyl arabin $\text{C}_8\text{H}_8(\text{C}_2\text{H}_3\text{O})_2\text{O}_8$. It is saponified by alkalis, with reproduction of soluble gum. Gum arabic is not precipitated from solution by alum, stannous chloride, sulphate or nitrate of copper, or neutral lead acetate; with basic lead acetate it forms a white jelly, with ferric chloride it yields a stiff clear gelatinoid mass, and its solutions are also precipitated by borax.

The finer varieties are used as an emollient and denulcent in medicine, and in the manufacture of confectionery; the commoner qualities are used as an adhesive paste, for

giving lustre to crape, silk, &c., in cloth finishing to stiffen the fibres, and in calico-printing. For labels, &c., it is usual to mix sugar or glycerin with it to prevent it from cracking.

Physiologically nothing is yet definitely known of gum as a food material. Animals fed thereon soon die of inanition. Lehmann says it is not absorbed by the system, but according to Pavy, it is to a slight extent, as shown by the formation of amyloid substance in the liver of subjects fed on gum.

Gum senegal, a variety of gum arabic produced by *A. Verek*, occurs in pieces generally rounded, of the size of a pigeon's egg, and of a reddish or yellow colour, and specific gravity 1.436. It gives with water a somewhat stronger mucilage than gum arabic, from which it is distinguished by its clear interior, fewer cracks, and greater toughness. It is imported from the river Gambia, and from Senegal and Bathurst, and is collected in December and March yearly.

Chagal gum, a new variety brought from St Iago de Chili, resembles gum senegal. About 75 per cent. is soluble in water. Its solution is not thickened by borax, and is precipitated by neutral lead acetate; and dilute sulphuric acid converts it into dextro-glucose.

The imports of gum arabic into England during 1878 (including all the varieties) may be estimated as follows:—

	Tons.	Value.
Imports to London, about.....	106½	£40,000
" Liverpool, "	1554	77,000
	2618	£117,000

Of this about one-half is exported. These figures are only approximate, as, since the repeal of the duties in 1845, the returns do not discriminate between the various descriptions which are all classed together under the head of gum.¹

Gum Tragacanth, familiarly called gum dragon, exudes from the stem, the lower part especially, of the various species of *Astragalus*, and is collected in Asia Minor, the chief port of shipment being Smyrna. Formerly only what exuded spontaneously was gathered; this was often of a brownish colour; but now the flow of the gum is aided by incisions cut near the root, and the product is the fine, white, flaky variety so much valued in commerce. The chief flow of gum takes place during the night, and hot and dry weather is the most favourable for its production.

In colour gum tragacanth is of a dull white; it occurs in horny, flexible, and tough, thin, twisted flakes, translucent, and with peculiar wavy lines on the surface. When dried at temperatures under 100° C. it loses about 14 per cent. of water, and is then easily powdered. Its specific gravity is 1.384. With water it swells by absorption, and with even fifty times its weight of that liquid forms a thick mucilage. Part of it only is soluble in water, and that resembles gummic acid in being precipitated by alcohol and ammonium oxalate, but differs from it in giving a precipitate with neutral lead acetate and none with borax. The insoluble part of the gum is a calcium salt of bassorin ($\text{C}_{12}\text{H}_{20}\text{O}_{10}$), which is devoid of taste and smell, forms a gelatinoid mass with water, but by continued boiling is rendered soluble, owing, according to M. Giraud, to its being changed into pectin. A small quantity of starch is always naturally present in gum tragacanth. The composition of gum tragacanth is generally given as arabin 53 per cent., bassorin and starch 33, water 11 (but M. Giraud considers its composition to be water 20 per cent.), mineral matter 3, a pectinous principle (apparently identical with the pectose of Frémy) 60, soluble gum 10, cellulose 3, starch 3, mineral matter 3, with traces of nitrogenous matter. Graham (*Chemical and Physical Researches*, p. 589) speaks of its being likely that native gums insoluble in water are the pectous form of soluble gum, and Giraud's experiments point to the correctness of that surmise.

¹ For varieties of gum arabic, see *Pharmacographia*, pp. 209, 210; *Catalogue Muséum Pharm. Soc.*, pp. 37, 38; also Pereira, *Mat. Med.*, vol. ii., pt. ii., p. 334; for physiological properties, Pavy, *Foods and Dietetics*, 2d ed., pp. 112, 438; and for chemistry, *Watts's Dictionary*, vol. ii. p. 953.

Gum tragacanth is used in calico-printing as a thickener of colours and mordants; in medicine as a demulcent and vehicle for insoluble powders, and as an excipient in pills; and for setting and mending beetles and other insects. The imports during 1878 were—

	Packages.	Value.
To London.....	2570	£46,200
To Liverpool, about.....	1200	21,600
	3770	£67,800

Gum kuteera resembles in appearance gum tragacanth, for which the attempt has occasionally been made to substitute it. It is said to be the product of *Sterculia urens*, a plant of the natural order *Sterculiaceæ*, and is unknown to British commerce.

Cherry Tree Gum is an exudation from trees of the genera *Prunus* and *Cerasus*. It occurs in shiny reddish lumps, resembling the commoner kinds of gum arabic. With water, in which it is only partially soluble, it forms a thick mucilage. The soluble portion is arabin, the insoluble cerasin, which according to Frémy is a calcium salt of metagummic acid (C₁₂H₂₂O₁₁). It is not used commercially.

Gum of Bassora, from Bassora or Bussorah in Asia, is sometimes imported into the London market under the name of the hog tragacanth. It is insipid, crackles between the teeth, occurs in variable-sized pieces, is tough, of a yellowish-white colour, and opaque, and has properties similar to gum tragacanth. Its specific gravity is 1.3591. It contains only 1 per cent. of soluble gum or arabin. Under the name of Caramania gum it is mixed with inferior kinds of gum tragacanth before exportation.

Mucilage.—Very many seeds, roots, &c., when infused in boiling water, yield mucilages which, for the most part, consist of bassorin. Linseed, quince seed, and marsh-mallow root yield it in large quantity (see also GUMBO). In their reactions the different kinds of mucilage present differences; e.g., quince seed yields only oxalic acid when treated with nitric acid, and with a solution of iodine in zinc iodide it gives, after some time, a beautiful red tint. Linseed does not give the latter reaction; by treatment with boiling nitric acid it yields mucic and oxalic acids.

Gum Resins.—This term is applied to the inspissated milky juices of certain plants, which consist of gum soluble in water, resin and essential oil soluble in alcohol, other vegetable matter, and a small amount of mineral matter. They are generally opaque and solid, and often brittle. Their chief uses are in medicine. They include the following:—ammoniacum, asafetida, bdellium, euphorbium, frankincense or olibanum, galbanum, gamboge, myrrh, opoponax, sagapanum, and scammony. Several of the resins are often improperly called gums; e.g., benzoin or benjamin, copal, dammar, elemi or animi, kawrie or cowdie or Australian copal, mastic, sandrac, and shellac. (J. St.)

GUMBINNEN, the chief town of a government district of the same name in the Prussian province of East Prussia, is situated on the Pissa, an affluent of the Pregel, and on the Eastern Railway, 22 miles south-west of Eydtkuhnen on the Russian boundaries. The surrounding country is pleasant and fruitful, and the town is well built, with spacious and regular streets shaded by linden trees. It has three Evangelical churches, a synagogue, a gymnasium, a higher burgher school, a public library, a hospital, and an infirmary. In the market square there is a statue by Rauch of Frederick William I., who in 1724 raised Gumbinnen to the rank of a town, and in 1732 brought to it a number of persons who had been driven from Salzburg by religious persecution. On the bridge over the Pissa a monument has been erected to those of the inhabitants who fell in the Franco-German war of 1870-71. Iron founding and the manufacture of machinery, wool, cotton,

and linen weaving, stocking-making, tanning, brewing, and brandy-making are the principal industries. There are horse and cattle markets, and some trade in corn and linseed. The population in 1875 was, including the garrison, 9114.

GUMBO, or OKRA, termed also *Okro*, *Ochro*, *Ketmia*, *Gubbo*, and Syrian Mallow (Sanskrit, *Tindisa*; Bengali, *Dheras*; Persian, *Bámiyah*—the *Bannia* of Prosper Alpinus; French, *Gombaut*, or better *Gombo*, and *Ketmie comestible*), *Hibiscus esculentus*, L. (*H. longifolius*, Roxb.; *Abelmoschus esculentus*, Guill. and Perr.), an herbaceous hairy annual plant of the natural order *Malvaceæ*, a native of the Old World, and now naturalized or cultivated in all tropical countries. The leaves are cordate, and 3 to 5-lobed, and the flowers yellow, with a crimson centre; the ovary is 5-celled, and the fruit or pod, the *Bendi-Kai* of the Europeans of southern India, is a tapering, 10-angled, loculicidal capsule, 4 to 10 inches in length, except in the dwarf varieties of the plant, and contains numerous oval dark-coloured seeds, hairy at the base. Three distinct varieties of the gumbo (*Quiabo* and *Quingombo*) in Brazil have been described by Pacheco. The unripe fruit is eaten either pickled, or prepared like asparagus. It is also an ingredient in various dishes, e.g., the *gumbo* of the Southern United States, and the *calalou* of Jamaica; and on account of the large amount of mucilage it contains, it is extensively consumed, both fresh and in the form of the prepared powder, for the thickening of broths and soups. For winter use it is salted, or sliced and dried. The fruit is grown on a very large scale in the vicinity of Constantinople. It was one of the esculents of Egypt in the time of Abul-Abbas el-Nebâti, who journeyed to Alexandria in 1216 (Wüstenfeld, *Gesch. d. Arab. Aerzte*, p. 118, Gött., 1840), and, according to Popp, is still cultivated by the Egyptians, who called it *Bammgé*.

The seeds of the gumbo are used as a substitute for coffee. From their demulcent and emollient properties, the leaves and immature fruit have long been in repute in the East for the preparation of poultices and fomentations. Alpinus (1592) mentions the employment of their decoction in Egypt in ophthalmia, and in uterine and other complaints. In the *Pharmacopœia of India* the decoction of the fruit is recommended in catarrh, and in diseases of the genito-urinary tract, and its hot vapour in affections of the throat and fauces.

The Musk Okra (Sanskrit, *Latkasturikâ*, cf. the Greek *καστωρ*; Bengali, *Latâkasturi*; German, *Bisamkörnerstrauch*; French, *Ketmie musquée*), *Hibiscus Abelmoschus*, L. (*Abelmoschus moschatus*, Mch.), indigenous to India, and, it is said, to Guiana and Central America, and cultivated in most warm regions of the globe, is a suffruticose plant, bearing a conical 5-ridged pod about 3 inches in length, within which are numerous brown reniform seeds, smaller than those of *H. esculentus*. The seeds possess a musky odour, due to an oleo-resin present in the integument, and are known to perfumers under the name of *ambrette* as a substitute for musk, instead of which drug it has been proposed to employ them medicinally. They are stated to be used by the Arabs for scenting coffee. In India they are employed for perfuming medicinal oils, and being regarded as tonic and carminative form part of sundry pharmaceutical preparations. The seeds (in the Fantee language, *Incro-mahom*), as we learn from Mr E. M. Holmes, are used in Africa as beads; and powdered and steeped in rum they are valued in the West Indies as a remedy for snake-bites. The plant yields an excellent fibre, and, being rich in mucilage, is employed in Upper India for the clarifying of sugar. The best-perfumed seeds are reported to come from Martinique.

GUMRI, or as it is now more frequently called **ALEX-ANDROPOL**, in honour of the empress Alexandra, a town of Russian Armenia in the province of Erivan, on the old frontier of the Turkish territory which was formed by the river Arpachai. It is situated at a height of 5268 (according to Abich, 4819) feet above the sea, on an eminence which commands the environs but is somewhat defective in a military point of view because the neighbouring valleys form a kind of screened approaches. The fortifications, erected in 1837 by command of Nicholas I., are the strongest in that part of Asia with the exception of those of Kars, and would be quite impregnable to an Eastern army. Like the ordinary houses of the town, they are built of limestone; and they consist of regular bastions casemated and mounted with guns and surrounded with a ditch. There are several handsome Armenian churches in Gumri, one of the finest of which was built in 1872. The town passed to Russia by the peace of Adrianople. In 1840 it was made a district town of the Gruzeno-Imeritian government, and in 1850 it was incorporated with the Erivan government. In 1832 it contained only about 60 houses, but they had increased to 1200 in 1838. At present its population is about 16,000.

GUMTREE. See **EUCALYPTUS**.

GUN-COTTON (*Pyroxilin, Coton poudre, Fulmi coton, Schiessbaumwolle*). In 1838 Pélouze observed that when cotton fabric or paper were immersed in cold concentrated nitric acid for a short time, the free acid being subsequently removed by washing, these materials became, without important alteration of structure, converted into substances possessed of explosive properties. These were at the time accepted as closely allied to the substance named *xyloidin*, described some years previously by Braconnet, which is obtained by adding water to a solution of starch in cold nitric acid. But subsequent observation established the identity of these explosive products with the explosive cotton, or gun-cotton, of which in 1845 Schönbein announced the discovery, and which he at once proposed as a substitute for gunpowder. Soon after this announcement Böttger and Otto published the method of producing gun-cotton by immersing carded cotton in cold concentrated nitric acid, and subsequently Knop introduced the more advantageous method of treating the cotton wool with a mixture of nitric and sulphuric acids, the latter being used as a dehydrator of the nitric acid, and as an absorbent of the water eliminated by the nitrification of the cellulose or cotton fibre. The composition of gun-cotton was subsequently made the subject of study by Böttger, Pélouze, Péligot, Von Kirchhoff, Sobrero, Béchamp, Porret, Crum, Gladstone, Hadow, and others, and various formulæ were proposed as representing its composition. The divergence of opinion on this point arose partly from difficulties attending the preparation of uniform products, and the obtaining of trustworthy analytical results with these, and partly from differences of opinion regarding the nature of the chemical reaction, whereby the cellulose becomes converted into an explosive body. The products obtained in the earlier investigations differed very much as regards their solubility in mixtures of alcohol and ether, and also with respect to the proportion which their weight bore to that of the cotton wool employed in the experimental operations. Crum was the first to entertain the view that gun-cotton might be regarded as cellulose, in which the two or three atoms of hydrogen are replaced by their equivalent of nitric peroxide. This view was afterwards also advanced by Gerhardt, and it received strong support from the researches of Hadow, whose results established the fact that several distinct varieties of pyroxilin could be produced by varying the proportions of nitric and sulphuric acids used, and who definitely established the composition of three of these, the

most explosive of which constituted the chief proportion of the product ordinarily obtained as gun-cotton, and had the composition expressed by the name trinitrocellulose. This highest nitro-product in its pure state is insoluble in mixtures of ether and alcohol, whereas the lower products (one of which is the so-called *collodion gun-cotton*, used for photographic purposes, see **COLLODION**, vol. vi. p. 149) differed in regard to their ready solubility in different mixtures of those solvents. Crum's formula for pyroxilin, thus confirmed by Hadow, was afterwards strongly supported by Schrötter, Redtenbacher, and Schneider, in their joint investigation of gun-cotton manufactured in Austria by the improved process of Von Lenk, and though again disputed by Pélouze and Maury, and by Champion and Pellet, the correctness of the formula $C_6H_7N_3O_{11}$ (or $C_6H_7O_5.3N_2$), originally proposed by Crum, was conclusively established in 1866 by the exhaustive analytical and synthetical experiments of Abel. In the manufacture of gun-cotton, even when most carefully conducted, the most explosive product, trinitrocellulose, is never obtained in a condition even approaching purity; it always contains an admixture (ranging from 4 to 10 per cent. in the products of highest quality) of the lower nitrocellulose products, *i.e.*, the soluble varieties of gun-cotton. In addition to these impurities it contains, even when the cotton employed has been submitted to purification by treatment with alkali, small proportions of nitrogenized matters, soluble in alcohol, formed from resinous or fatty substances retained within the cotton fibre. These substances are very much more prone to undergo decomposition (with development of nitrogen acids) by exposure to heat or light than the cellulose derivatives themselves; and Abel's experiments demonstrated that the uncertain stability of gun-cotton, which brought this material into bad repute not long after its discovery, from the occurrence of disastrous explosions arising apparently from its spontaneous decomposition, was ascribable primarily to the development of free acid in the gun-cotton by the action of comparatively moderate heat or of light upon these impurities.

The occurrence of a violent explosion at the works of Messrs Hall of Faversham, not long after they had commenced the manufacture of Schönbein's gun-cotton wool, followed by a similar casualty in France, led to the abandonment of endeavours to apply this substance, within a brief period of its discovery, except in Austria, where Von Lenk persevered in attempts to devise means for obtaining it in a purer and therefore more stable condition, as well as for bringing its explosive action sufficiently under control to permit of its advantageous employment as a substitute for gunpowder, not only for destructive but also for projectile purposes. The system of manufacture elaborated by Von Lenk consisted in loosely spinning long staple cotton into yarn of various sizes and different compactness; this yarn was converted into gun-cotton by very careful treatment with a large excess of the strongest nitric and sulphuric acids, the product being immersed for many weeks in running water, and then treated with weak alkali; the gun-cotton yarn and thread were either wound more or less compactly on reels or cores, for employment in firearms, or made up into very compact ropes with hollow cores, or into plaits, of lamp-wick form, for employment in shells or mines. The rapidity of explosion of the gun-cotton, *in open air*, or under slight confinement, was thus brought to a great extent under control, but if the resistance opposed to the expansion of the highly heated gases upon the first ignition of the confined gun-cotton developed sufficient pressure to cause them at once to penetrate the inner structure of gun-cotton fibre which composed a charge, a sudden and violent explosion was thus brought about. Hence no practical advance was made in the reduction of the violence

of action of gun-cotton by Von Lenk's researches. By the system which Abel has more recently elaborated the fibre after its conversion into gun-cotton is reduced to a very fine state of division; when in this condition the explosive substance is readily converted into sheets or granules, or by compression into homogeneous masses of various degrees of compactness, and of any desired form. In this manner the rapidity of action or explosion of gun-cotton may be reduced to a minimum, though uniformity of action in fire-arms is still very difficult to attain with it. As the reduction of the gun-cotton fibre to a very fine state of division greatly facilitates the removal by washing, and by alkaline treatment, of the small quantities of unstable impurities already spoken of, the stability of gun-cotton as now manufactured is much greater than that of former products. Compressed gun-cotton needs, like the other forms in which this explosive has been used, very strong confinement for the development of violent explosion, but this can be readily accomplished without any confinement of the substance, through the agency of an initiative detonation; the explosion of 2 grains of strongly confined mercuric fulminate *in close contact with the compressed material* suffices to ensure this result (see *Detonation*, article EXPLOSIVES, vol. viii. p. 809). Gun-cotton contains in the normal (air dry) condition 2 per cent. of water. The compressed material of the ordinary density (= about 1) contains from 25 to 30 per cent. of water when saturated; even with 15 per cent. it is unflammable, and when containing 17-20 per cent. it may be cut and drilled with perfect safety. If gun-cotton contains more than the normal 2 per cent. of water it can no longer be detonated by the minimum quantity of fulminate, and the strength of the initiative detonation has to be increased in proportion to the amount of water it contains; when it contains 17 per cent. of water, its detonation cannot be accomplished with less than 200 grains of confined fulminate. An initiative charge of 1 ounce of air dry gun-cotton (detonated by means of an ordinary fulminate fuze) suffices, however, to ensure the detonation of wet gun-cotton (as used in mines, torpedoes, rockets, &c.). The susceptibility of gun-cotton to detonation when wet (and therefore perfectly unflammable) gives this substance a great advantage over other explosive agents, as it may be stored in a perfectly harmless condition (wet gun-cotton being quite unalterable) and at once used in that state as a powerful destructive agent through the agency of a detonating charge. The explosive action of wet gun-cotton is somewhat sharper than that of the dry material, the detonation being transmitted through its mass with greater

rapidity in consequence of the displacement of air in its pores by the incompressible liquid. Gun-cotton, if it consists entirely of trinitrocellulose, does not contain sufficient oxygen for the complete oxidation of its carbon; hence more work can be accomplished with a given weight of gun-cotton if a solid oxidizing agent (a nitrate or a chlorate) be incorporated with it in proportion sufficient for complete oxidation. The compressed preparations (chlorated or nitrated gun-cotton) are as sensitive to detonation as gun-cotton itself, but are less sudden or sharp in their action. These preparations, first manufactured by Abel, were extensively experimented with some years ago, and one of them, prepared with barium nitrate, is now manufactured under the name of *tonite* for blasting purposes. Preparations allied to gun-cotton, in the production of which wood-fibre is used as the starting point, are manufactured for sporting and blasting purposes under the name of Schulze's powder, sawdust powder, and patent gunpowder. (F. A. A.)

GUNDULITSCH, IVAN (1588-1638), called GIOVANNI GONDOLA, one of the most celebrated Dalmatian poets, was born August 8, 1588, at Ragusa. His early education was superintended by two Jesuits, S. Muzzi and R. Ricasoli, the latter of whom instructed him in philosophy. At the age of twenty Gundulitsch applied himself to the study of jurisprudence; and three years afterwards he was entrusted with a high official post in the Ragusan republic. Farther particulars of his life are not known; he died December 8, 1638. Among his numerous poems the greatest is an epic entitled *Osman u dvadeset pievanjah* (Osman in twenty cantos), printed for the first time at Ragusa in 1826, and reprinted at Agram in 1854, with a biographical sketch of the author by A. T. It was written to celebrate the victory of the Poles over the Turks and Tartars in the campaign of 1621. Cantos 14 and 15 are lost, having been suppressed by the Government of Ragusa on account of their writer's animosity against the Turks; but in their place others have been added by P. Sargo. An Italian version of this poem appeared in 1827. Of Gundulitsch's other poems, the *Hymn on the Greatness of God* and the *Tears of the Afflicted Son*, and his dramas the *Rape of Proserpine* and the *Sacrifice of Love*, deserve notice. He also made several metrical translations from the Italian poets. Gundulitsch's poems, besides their literary value, are specially interesting to a student of history, as they give a faithful picture of the time in which they were composed. A complete edition of his works, edited by V. Babukich, was published by the Illyrian university in 2 vols., Agram, 1847.

GUNDWANA, a form of the name GONDWANA (*q. v.*).

G U N M A K I N G

UNDER this head falls the manufacture of every description of firearm, from the pistol to the 100-ton gun. The term "small arms" includes sporting and military weapons carried by the shooter; instruments fitted for firing a rapid succession of bullets through one or more barrels from a rest are termed "machine guns;" while the heavier pieces, used exclusively in war, are denominated "ordnance."

SMALL ARMS.

The date and circumstances of the introduction of portable firearms are involved in obscurity. No doubt many attempts were made and failed previously, but gunpowder does not appear to have come into practical use as a rival to the crossbow for the propulsion of bolts or bullets till the reign of Edward III.; in 1375 mention is made of men armed with "gonnes" at an attack made on a Yorkshire manor-house. The *arquebuse à mèche* was employed in Germany in 1378, and it is therefore probable that some

rough weapon was introduced much earlier. The hand-gun (fig. 1) was used by both infantry and cavalry; it consisted of a simple iron or brass tube with touch-hole at the top, fixed on a straight stock of wood; when used on foot, the soldier held it firmly by passing the stock under the arm; when used on horseback the stock was shortened to butt against the breast, the barrel resting on a fork secured to the saddle bow. About the beginning of the reign of Henry VII. the hand-gun was improved by the addition of a cock, which was brought down by a trigger to a pan at the side of the barrel; this cock held a match which ignited a priming in the pan, the priming communicating with the charge by a small hole. The next alteration consisted in the introduction of the wheel-lock, in which a steel wheel, rasped at the edge, protruded into the priming pan. Into the cock was fitted a piece of sulphuret of iron (pyrites) instead of a match; this was kept down to the priming pan by a spring; another spring, when wound up, acted on the

wheel, which, when released by the trigger, spun round, rubbing against the pyrites and causing sparks, which set fire to the priming. The wheel-lock was, however, found to be complicated, expensive, and uncertain, so that the match-lock remained in use till the middle of the 17th century, when it was displaced by the flint-lock, the earliest form of which, the "snapaunce," seems to have been invented about the end of the 16th century in Germany. In this lock the priming pan was provided with a steel cover and the cock held a flint; on pulling the trigger the cock fell, the flint struck the steel cover, forcing it back from the pan, evolving at the same time sparks, which fired the priming. During these developments of the lock the shape of the barrel was gradually changed; in 1621 the length of that of the musket was 4 feet, and the size of the bore such that twelve bullets weighed 1 lb. Soon after this the infantry soldier was supplied with a dagger,

FIG. 1.—Hand-Gun.

which fitted into the muzzle and served as a pike. This was improved at Bayonne into the bayonet, and during the latter part of the 17th century was still farther improved by the addition of a socket, so that the musket could be fired while the bayonet was fixed ready for use. Little change in firearms took place in the 18th century, but in 1807 a Scotch clergyman named Forsyth obtained a patent for priming with fulminating powder, an invention which, though it slumbered till 1834, was destined to cause a complete revolution in the mechanism of firearms. Early in the present reign its value was fully recognized; the magazine of detonating composition and the priming pan used by Mr Forsyth were improved into the cap and nipple, and the flint-lock was entirely superseded. At this point, the progress of invention renders it necessary for us to treat separately the two branches of the subject, and to divide sporting from military arms.

For sporting purposes smooth-bored shot-guns and grooved rifles are employed. Both are nearly always double-barrelled, and of late years the old muzzle-loaders have been almost entirely supplanted by the many breech-loading systems recently invented, which enable the sportsman to reload with greatly increased rapidity and uniformity, the latter quality being specially important in rifle shooting. The chief parts composing the arm are the barrel, the lock, and the stock. Barrels for sporting arms are made of four different kinds of material—Damascus twist, laminated steel, stub iron, and mild cast-steel; besides these, common material is worked up into cheap barrels for exportation. Damascus twist consists of alternate rods of iron and steel placed one upon another; usually six of each kind are thus arranged; they are then forged and thoroughly welded to-

gether into a solid bar, which is afterwards rolled into rods, having a section about $\frac{3}{8}$ inch square. The rod thus formed is raised to a brightish red heat, and one end of it is placed in a revolving chuck, while the other remains fixed; the turning of the chuck subjects the rod to a severe twisting throughout its whole length, so that at last it acquires the appearance of a screw having a very fine thread. Three of these rods are then placed together, the twist of one being in a contrary direction to that of the other two. They are then welded together into a bar, and rolled into a strip about $\frac{3}{4}$ inch in width. The thickness of this strip depends on the part of the barrel it is intended to form; if for the breech end it is made $\frac{1}{4}$ inch thick, if for the centre $\frac{3}{16}$ inch, if for the muzzle $\frac{1}{8}$ inch. These strips are now ready for coiling, which is performed by raising the strip to a bright red heat, fixing one end of it to a hook projecting from a taper mandril, which is placed in a machine and provided with a handle. On turning the handle the strip is wound round the mandril into a coil about 10 inches in length. The coil is then welded by about 3 inches at a time till the spirals unite to form a hollow cylinder; it is then hammered on a small mandril till the welding is complete. Three coils welded together end to end form a barrel, to which the three different thicknesses of metal above mentioned give a slightly conical form, approximating to the ultimate shape. About three-fourths of the material is cut away in the making; 16 lb of iron are used in the first instance to make a pair of barrels, which weigh only 8 lb when the welding is finished, and only between 3 and 4 lb after boring and grinding. In the manufacture of laminated steel barrels the best quality of steel scrap, after thorough cleaning in a revolving drum, is mixed with a small proportion of charcoal iron. The mixture is heated in a furnace, and puddled into a ball, which is well worked up under a forge hammer. It is then drawn out under a tilt hammer, and rolled into strips of the required length and thickness, after which it is treated as above described. This material is much esteemed for its hardness and closeness of grain, but it does not possess the elegant marking and appearance of the Damascus twist. Stub iron for barrels was formerly made by putting a quantity of old horse-shoes or stubs into an iron ring, welding them into a solid mass, and then rolling them out to strips of the requisite dimensions. Now a mixture of best wrought scrap, and sometimes steel scrap with stubs, is preferred, as giving more hardness and durability to the barrels. A description of the manufacture of cast-steel barrels will be found below, in connexion with military rifles. A sham-twist barrel is apt to impose on the purchaser; plain iron is cheaper than twisted iron, and sometimes a thin coil of twist is rolled round a plain inner tube; the whole is then welded together, and has all the appearance of a genuine twisted barrel. Other cheap barrels are made by rolling up strips of iron plate, and welding them together so that each barrel has a weld running down its whole length. As the breech end is thicker than the muzzle end, these barrels are usually made in two lengths.

In the rough state just described the barrels are sent from the forge to the gunmaker, who bores them carefully out to nearly the finished size. He then turns them down at intervals, obtaining correct surfaces by means of inside and outside gauges. The barrels are then "stripped"—that is, turned down the whole length to correspond with the bore. For double guns two barrels are now brazed together, near the muzzle and near the middle. At the breech the barrels are separated by a "steel lump." The axes of the barrels are not quite parallel to each other, but are usually adjusted to cross at about 40 yards from the gun. When packed together, a rib is soldered on down the entire length, and they are sent to be proved at the proof-

house of the Company of Gunmakers at Whitechapel or Birmingham. The scale of proof is fixed by Act of Parliament, according to the size of the bore; it is considerably more than double the ordinary shooting charge. For the provisional proof, muzzle-loaders have the breech screwed in before firing; breech-loading barrels are pressed against a false breech. The second or definitive proof is less severe, and is carried out at a later stage, when the action of the breech-loader, or the percussion fitting of the muzzle-loader, is completed.

The best stocks are made of English or Italian walnut, pieces of which reach the gunmaker roughly shaped. They are so cut that the grain shall run lengthways down the stock, and the wood is dried and seasoned to prevent warping. For expensive guns, much attention is paid to beauty of mottling and depth of colour. A considerable variety of tools is employed in shaping the stocks and cutting out the beds for locks, processes which, for sporting pieces, are performed by hand. All parts of the lock except the plate are of steel, and reach the gunmaker hammered into shape. The lock-plate is of wrought iron, case-hardened. The parts are worked to fit by hand with a number of special tools. Bar locks are those which have a forward action, arranged so that the main-spring fits under the bar below the breech end of the barrels; back-action locks have the spring reversed, so as to extend down

Locks.

FIG. 2.—Early breech-loader. C, pinfire cartridge; S, single grip.

the hand or grip of the stock. The remaining portions of the gun are termed the furniture. They are the heel-plate which covers the butt, the break-off into which the breeching hooks for muzzle-loaders, the trigger plate, the trigger guard, the hammers, the escutcheons, and bolt fastening the barrel to the stock, &c. For breech-loaders the action is a most important part of the furniture. The ingenuity of gunmakers has devised an immense variety of actions, and every day sees progress made in strength and simplicity. M. Lefauchaux is entitled to the credit of inventing the modern sporting breech-loader. He first hit on the combination of a pair of barrels open at the breech, playing on a hinge and abutting against a false breech (fig. 2), with a strong-based cartridge-case containing powder and shot ready for firing, and supplied with its own means of ignition. His early guns were found weak in the fastening of the barrels to the stock, while the mode of igniting the charge was far from perfect. It consisted of a pin passing through the upper part of the cartridge case, the point resting just above a percussion cap placed at the centre of the base of the charge; the hammer fell on the head of the pin, driving the point into

Furniture.

FIG. 3.—Central-fire cartridge.

the cap, and exploding the detonating composition. The gas was found to escape through the pin hole, the extraction was sometimes difficult, and a fall on hard ground would occasionally explode the cartridge; for these reasons the pin system was superseded by the central-fire method (fig. 3), in which the base of the cartridge case was made to hold a small anvil, on to which the cap was driven by a needle or striker passing through the false breech, and receiving the blow of the hammer. Fig. 4 shows a central-fire gun, having the action considerably strengthened by the double grip. In this system the extraction is accomplished

FIG. 4.—Central-fire Gun. C, central-fire cartridge; L, lever; W, washer; S, screw.

automatically, by a piece of steel fitting between the two barrels, and so cut as to clip the rims of both cartridges. To this extractor is attached a rod which runs down between the barrels through a hole in the steel lump as far as the hinge; on opening the joint the rod is driven backward, carrying with it the head and forcing the cartridge cases out of the barrels. Guns on the central-fire system afford no indication of being loaded; extraction and loading are, however, so rapid and easy that every sportsman should invariably withdraw the cartridges on laying down his gun, and reload on again taking the field. Hammers sometimes

FIG. 5.—Improved breech-loading action.

catch in the brambles, or even in the clothes of the shooter; even the double grip has been known to yield under the effect of the heavy charges now used. The latest guns leave little room for improvement in respect to the action. Fig 5 shows one of the newest developments. The hammers are abolished altogether, the striker being a needle in the interior, which is driven against the cap of a central-fire cartridge by a spring when the trigger is pressed; a lever on the top is pushed aside by the thumb, liberating the catch which holds the barrels against the false breech; the barrels then drop from the hinge, and are open for loading. On raising the barrels, the action snaps to, and holds them fast; the dropping of the barrels causes an extractor to withdraw the empty cartridge cases. A key at the side regulates the cocking and safety of the lock and striker.

The sizes of barrels are designated according to the weight of the solid spherical lead ball which will just fit them, and hence their diameters vary inversely as the cube roots of their numbers. In the case of No 12 bore, the ball fitting it weighs 12 to the pound, and measures .729 in. in diameter. Ounce bullets (No. 16) fit a bore of .662 in. in diameter.

Barrels were formerly bored cylindrically, but the experiments of gunmakers led them to suppose that better shooting could be obtained by boring to shapes departing in various ways from the simple cylinder. The first modification introduced consisted in enlarging the breech end slightly for about 10 inches; subsequently the last few inches at the muzzle were enlarged also, so that the barrel really consisted of two frusta of cones, having the smaller ends together,—the position of the narrowest part, like many other matters, was dependent on the fancy of the gunmaker. Of late an attempt has been made to reduce the interior form of the barrel to something like a system, and several kinds of "choke" boring have been introduced. The object to be attained with a shot-gun is to so arrange the charge that the pellets shall be uniformly and thickly distributed round the mean trajectory, and shall also

feet per second (about 40 miles an hour), it will traverse a space of 2 feet in the interval, and so will not receive the

FIG. 8.—Plain choke.

FIG. 9.—Double choke.

FIG. 10.—Greener's choke.

charge at all in the manner shown on the target. Figs. 8, 9, 10 show some of the choke bores fancied by different makers.¹

The manufacture of sporting rifles does not greatly differ from that of shot-guns. Greater strength and weight of rifles barrel are necessary to resist the pressure of the charge, withstand the wedging action of the bullet, and deaden the recoil. The breech-closing action also demands greater strength, but the general arrangements are not different in principle. Rifles for sporting purposes differ from military pieces in being double-barrelled, and in requiring accuracy and penetration at short ranges, instead of a flat trajectory at very considerable distances. Hence they generally resemble the shot-guns in their action, and fire more powder in proportion to the weight of the bullet than military rifles.

In fig. 11 the treble grip snap action is shown as specially devised for rifles firing heavy charges. In addition to the holding power thus provided, a piece is sometimes made to

FIG. 11.—Treble grip snap action.

extend from the rib between the barrels, terminating in a projection which catches in a recess in the top of the false

¹ No accurate or crucial experiments have as yet been carried out to determine the true action of these forms, but the editor of *The Field* is now preparing instruments and endeavouring to approach the subject in a scientific manner. The general principles, as far as they can be gathered at present, are, that enlarging or relieving the barrel slightly, reduces the friction and allows the shot to acquire greater velocity, while choking the barrel at the muzzle has the effect of directing the outer pellets inwards, and so concentrating the charge.

Fig. 6.

occupy a small space longitudinally. In fig. 6 a side view of the charge as it passes through the air is given, *ab* being the mean trajectory. Exact experiments to determine the proportions of the cloud of shot fired from different guns do not exist, but, judging from observation, they will usually not depart greatly from those of the figure.

In fig. 7 is seen the appearance of the target after being struck by the charge. The test of excellence is regularity of pattern, combined with penetration; that is, a circle of 30 inches diameter should be so pitted by the shot at 40 yards range that gaps of the size of a small bird should nowhere exist, while the individual pellets should retain force enough to penetrate a certain number of sheets of brown paper. As the shot pass along a barrel driven violently forward by the powder gas, it is probable that the edges of the charge are retarded by friction against the sides of the bore, so that the centre portion extricates itself rather sooner than the edges, and travels with a slightly higher velocity. Supposing the charge to retain an average velocity, on reaching the object fired at, of 300 feet per second, and the leading pellets to have gained 10 feet on the hindmost ones, so that the charge is distributed over a length of 10 feet, a period of time of $\frac{1}{30}$ th of a second will elapse between the blows of the first and last pellet. If the object be stationary, this interval will be almost imperceptible, and the pattern made on the target by the impact of the shot will exhibit no trace of it. But if the object be a bird flying across at the rate of 60

Fig. 7.

breech, when the barrels are closed; or the catch shown in fig. 5 may be adopted. Some makers, instead of using the hinge principle introduced by Lefaucheu, close the breech in other ways; thus in the Henry action the barrel does not move, but is closed at the breech end by a sliding vertical block, which is depressed for the admission of the cartridge by a lever underneath the trigger guard; the striker passes through the block, which on being lowered extracts the cartridge. The power of a modern rifle is limited only by the power of the shooter to withstand the effect of recoil and to use a heavy piece. The momentum of the bullet forwards up to the time of its leaving the muzzle is equal (neglecting the weight and motion of the gas generated by the powder charge) to that of the gun backwards at any instant. Supposing the gun to weigh 150 times as much as the bullet, it will acquire a velocity against the shoulder equal to the 150th part of that acquired by the bullet. Practically it is this velocity which measures the severity of the recoil, and the heavier the gun and the more powerful the shooter the more momentum can he afford to impart to his bullet. This momentum may be composed of high speed and low weight, or of low speed and high weight. A light bullet starting with a high velocity travels fast at first and drops but little at a short range; it speedily, however, suffers retardation by the resistance of the air, and would soon be beaten by a heavier bullet of the same diameter starting with the same momentum. The Express rifles carry out this principle with great completeness, employing heavy powder charges and imparting very high speed to a light bullet, so that a range of about 130 to 150 yards is traversed with a drop not exceeding 1 foot. Fig. 12 shows the nature of bullet generally used for these pieces; the hollow in the centre permits the lead to expand and flatten out on striking, inflicting a wound of great severity. Explosive bullets are also employed by some sportsmen. In fig. 13 are

Fig. 12.

Fig. 13.—Rifle cartridges.

shown rifle cartridges loaded ready for use. The solid brass-drawn case is now almost universally adopted, both for sporting and military purposes. The Martini-Henry rifles used by the British army, however, still use the soft brass-crimped case.

Military Rifles.—The principle of rifling small arms seems to have been discovered about the beginning of the 16th century, but does not appear to have been employed for warlike purposes till the middle of the 17th. In 1680 each troop of life-guards was supplied with eight rifled carbines. In 1800 the 95th regiment, now the rifle brigade, was armed with a 20-bore muzzle-loading rifle. The difficulty of loading a rifle after firing a few rounds was the great obstacle to its use in the field. Several methods were devised of providing anvils at the bottom of the bore on which a loose ball dropped in could be hammered to fit the grooves, but the principle of expansion by the action of the

powder was not brought forward till 1836, when Mr Greener submitted an egg-shaped bullet, having an opening at one end to receive a conical plug, which when driven home by the gas expanded the bullet into the grooves. Shortly after this the French chasseurs were armed with a rifle throwing an elongated bullet with a hollow-coned base. This was improved by Captain Minié, who added an iron cup to fit into the cone and expand it when forced home by the gas. For this cup a wooden plug was substituted in the three-grooved Enfield rifle in 1855. About this time Sir J. Whitworth brought forward his hexagonal rifling, the guiding idea of which was that every part of the hexagon except the actual corner should do its share of the work of giving rotation. He proposed for a barrel 39 inches long a bore of .45 inch, having one turn in 20 inches. This was intended to be suitable either for an expanding bullet, or for one possessing an easy mechanical fit. The length of the bullet was increased, and the form thus modified suffered much less from the resistance of the air than the previous patterns. The question of breech-loading for military weapons now began to assume importance. About 1841 the Prussians had adopted the needle gun, a breech-loader on the bolt principle. It was a rough weapon compared with the pieces lately introduced, but a great advance on any known at the time. A conical bullet rested on a thick wad, behind which was packed the powder, the whole being enclosed in strong lubricated paper. The detonator was in the centre of the hinder surface of the wad, so that to explode it a needle had to be driven forward from the breech through the base of the cartridge and through the powder. This was accomplished by the action of a spiral spring, when set free by the pulling of the trigger. This arrangement possessed many defects: the gas escaped freely at the breech; the long needles rusted and broke; the springs failed; and the weight of the piece was excessive. Such failings caused the sterling merit of the principle to be underrated, and it was not till 1864 that a committee of officers recommended the introduction of breech-loading arms for general adoption in the British army. The triumph of Prussia in the Seven Weeks' War with Austria in 1866 at once drew attention to the urgency of the case, and caused all civilized powers to re-arm their troops. In England the Enfield rifles (three-grooved expanding bullet muzzle-loaders) were converted into breech-loaders by the adoption of the Snider method, which consisted in cutting away 2 inches of the upper part of the breech end of the barrel so as to admit the cartridge, which was pushed forward into a chamber formed by enlarging the end of the bore. A block, opening on a hinge, was then shut down to fill up the space behind, forming a false breech against which the base of the cartridge abutted. The striker consisted of a needle passing through this breech block; when struck from behind by the hammer it was driven against a cap in the base of the cartridge, exploding the charge. By this means the existing rifles were rapidly converted, and the army was provided with a breech-loader of satisfactory efficiency should any emergency arise. Proposals were then invited, and a number of inventions submitted, the result of which was that in 1869 the combination of the Martini breech action with the Henry barrel was decided on for future manufacture, and the whole of the British army is now provided with these weapons (see figs. 14, 15, 16, 17). The general principles of manufacture are the same for all kinds of military breech-loading rifles. It will be sufficient to give the details of one *in extenso*.

The manufacture of the Martini-Henry rifle, as carried out at the Government factory near Enfield, involves 2004 separate operations which have to be performed on each rifle before it is complete for issue. This number is subject to slight variations caused by changes of pattern from time

to time. It will be sufficient if the principle of these operations are described, without entering minutely into details.

The rifle is composed of three parts:—the barrel, carrying the sights; the stock, into which fits the cleaning rod; the body, containing the lock and breech action. The soldier is also provided with a bayonet to fit on the muzzle.

FIG. 14.—Martini breech action (closed).

The barrel is made of mild steel manufactured on the Siemens principle. Cylinders of this material, 16 inches long and 1½ in. thick, are supplied by contract, and tests are made of a proportion from time to time. These cylinders are first rolled in the factory to a long cone, having slightly greater dimensions than the exterior of the

FIG. 15.—Martini breech action (open).

finished barrel. The cylinder is heated in the furnace and passed straight through a series of eight pairs of roll; each pair is grooved to receive it, the grooves becoming narrower and shallower as each successive pair is reached. The pairs are alternately vertical and horizontal; when they are in full work they can roll about 250 cylinders per hour.

FIG. 16.—Henry barrel.

The cone is next placed between friction rollers; these are set at a slight angle, so that in revolving they pass the cone along slowly. It emerges from their clutch polished with the compression, and showing their action by a close spiral traced on the surface. We have now a solid piece of mild steel, slightly thicker than the barrel, fairly straight and thoroughly well-consolidated.

The next step is to obtain true bearings for boring the interior and turning the exterior. The cone is placed in a clamp milling machine, and the ends milled d. s. n. This operation requires some judgment; the milling-down of the ends must be so performed that the centres shall be approximately true centres; that is, the amount of metal to be subsequently turned down off the exterior of the barrel shall be about equal all round. The ends, when milled down, serve for bearings by which the cone is next held horizontally, and drilled in a double-acting machine for 1½ in.; these act as

FIG. 17.—Henry rifling (true size and magnified).

centres when the barrel is placed vertically and drilled through from each end. Three tools are used, the last being of slightly greater diameter than the others. A shoulder is left in the centre to avoid the inconvenience of the tools from opposite ends not exactly meeting in the middle, as might be the case with the long slender drills necessarily employed. This shoulder is removed by a square tapered tool or "bit." We have now a cone slightly larger than the barrel, with a hole through it .433 in. in diameter. This hole is then bored out to .444 inch. Having now got a true inside, the next step is to obtain a true outside from it.

The cone is placed vertically in a machine, the lower end fitting accurately on a pin, the upper end passing loosely through a hollow chuck, which revolves round a centre in truth with the centre of the pin and the axis of the bore of the cone; the exterior of the cone, being slightly irregular, will be out of truth; sulphur therefore is melted and poured into the hollow chuck, filling up the space between the interior of the chuck and the exterior of the cone, and hardening on cooling. The chuck then holds the cone by the outside in truth, and serves as a bearing. The cone is then placed in a lathe, and two or three short cuts taken off the outside as bearings for the rough turning. This is called "spotting." It is now rough and finish turned, the outside becoming concentric with the inside; and the cone becomes a barrel.

It is next tested for truth of interior. Two tests are employed,—the first being that by shading. The barrel is placed in a rest, so arranged that the eye looking through the tube sees the straight line of the top of a window cutting horizontally across the aperture a little above the centre. If the barrel is accurately straight and brightly polished, the shadow thrown by the dark window-frame down the tube appears as in fig. 18. The interior circle shows the window as seen through the barrel, with the dark frame cutting across;

the next circle shows the shadow extending in a cone from A to B and C. This shadow is quite dark, and AB, AC are quite straight. BC is a portion of the arc cutting off the shadow sharply at a point half-way down the barrel.

FIG. 18.—Testing by shading.

There are two outer circles extending to the eye, and approximately resembling the sketch in shading. If the barrel is untrue in interior surface, or bent, the cone will at once lose its regularity, and the sides AB, AC will no longer be straight. Should they be irregular, the barrel is "set" by striking with a hammer or ebonite mallet across a setting block.

The barrel is next placed in a machine, and a horizontal spindle is run through it; on this spindle are two close-fitting gauges, one in the centre and one at the end; the barrel is then caused to revolve on the spindle, and an indicator with a long arm recording small graduations is inserted at the free end between the spindle and the barrel; any irregularity of turning is multiplied 200 times by the long arm, and becomes at once apparent.

After passing these tests the barrel is finish-turned; the back sight is soldered on and screwed, and the fore sight is brazed on; the size of bore is then gauged, after which the process of polishing is completed and the barrel is ready for rifling.

The rifling consists of seven grooves of the form shown in fig. 17. The twist is such that the bullet makes one complete revolution while travelling 22 inches; that is, one turn in 49 calibres of 0.45 in., to employ the phraseology generally applied to the rifling of cannon. Each groove is cut separately by a tool which acts when pulled; it forms the groove by five successive cuts, being forced to project a little more at each cut; it thus passes thirty-five times up and down the barrel to complete the rifling, which can be done in half an hour. The size of bore is now finally tested; it must lie between 0.449 and 0.451 inch. The rifling is similarly tested, and the twist gauged.

The breech end of the barrel is next chambered out to receive the cartridge, which is of the kind known as "bottle-shaped." The exterior of the breech end is of "Nock's" form, the upper surface being a flat, true to the bore. This flat guides all the fittings; the barrel is placed in a machine true to the flat, and the sights are gauged for line and elevation. No allowance is made for the deflexion due to twist of rifling, it being very slight. The barrel is lastly screwed at the breech end to fit the body.

Each barrel is twice subjected to proof by powder, once before rifling, once after. Sixteen are placed in a cast-iron frame; a temporary steel screw, furnished with a vent, closes each breech end, which rests against a leaden bar. The barrels are loaded from the muzzle; a train of powder ignited by a cap fires them simultaneously; the bullets are caught in a hollow cast-iron receiving frame, shaped like the shell of a snail. The charge for the first proof is 7½ drs. (= 205 grs.) of powder and a bullet weighing 715 grs., secured by a half-inch cork was forced down over it. The second proof is the same, except that only 5 drs. (= 137 grs.) of powder are used. The service charge is 85 grs. of powder with a bullet of 480 grs.

The barrel when finished is browned by being coated with browning mixture, and caused to rust in a steam tank; it is then brushed with wire brushes. This process is repeated four times, after which the exterior is oiled over. The browning mixture consists of—

Spirits of wine	5 oz.	Corrosive sublimate.....	4 oz.
Spirits of nitre	8 "	Blue vitriol	4 "
Tincture of steel	8 "	Water	1 gal.
Nitric acid	4 "		

The stock is in two parts,—the butt and the fore-end. They are of Italian walnut wood, and are supplied roughly shaped. They are tested for straightness of grain; weight, as indicating strength; "shakes" or cracks; "galls," caused by injuries over which the wood has grown; saltiness (which would cause absorption of moisture and consequent rusting), by putting a shaving into a solution of nitrate of silver;

and also for appearance. Those accepted are thoroughly seasoned by keeping, or dried in a desiccating chamber, warmed by hot air; they then go to the shaping machines, where they are cut to size by revolving cutters, making 4000 revolutions per minute, and are afterwards turned in copying lathes, hollowed out by copying gouges, and bored to take the fittings. They are then tested, machined, hand-finished, and oiled up.

The body is of mild steel; it is stamped out from the bar; it is then drifted through by a slightly tapered bar carrying a succession of cutters on it. The front part of the body is then screwed to suit the screw on the barrel, so that when home it shall fit accurately to the breech end. The lever, and indeed all parts except screws and springs, are stamped out of solid bar. Each part is milled by machinery to a correct fit; every fitting is interchangeable, and nothing is marked for selection to fit anything else. Each part is browned in the same way as the barrels, or blued.

On completion all parts are taken to the assembling room, where they are fitted together, screwed up, and turned out as finished rifles; after which they are taken to the practice ground, and tested for accuracy and extraction of cartridge by being fired from a rest at a target, the range being 500 yards.

The bayonet consists of a steel blade welded to a wrought-iron socket. Steel of a superior quality being used, it is supplied in bars, is cut into lengths, and is welded by the aid of borax to a short rod of rolled iron. The two are so put together as to form a right angle; the steel bar is put into a "Rydering" machine, which gives it a great number of rapid blows, and shapes it roughly into a blade. It is then rolled and cooled gradually under charcoal and coal-dust for annealing purposes. The socket is then drilled, and the blade ground. They are then bent into position and become a bayonet. Turning and finish-boring complete the sockets, while the blades are fine-ground, hardened, tempered, tested, and polished. The sockets are then browned and adjusted to the rifles.

About 1400 operatives are employed at the Government factory; each Martini-Henry rifle costs about 48s., all expenses reckoned; and to render the establishment thoroughly remunerative, the out-turn should be about a rifle a week per man.

The systems of breech-loading muskets employed by different nations are shown in the following table:—

Country.	Nature.	No. of Motions.	Action.
Austria	Werndl	5	Block rotating sideways.
Bavaria	Werder	4	Falling block.
Denmark	Remington	5	Block hinged to rear, supported by a cam.
England	Martini-Henry	4	Falling block.
France	Gras	4	Sliding bolt.
Germany	Mausier	4	Do.
Italy	Vetterli	4	Do. (magazine gun).
Russia	Berdan	5	Block hinged to front (old). Sliding bolt (new).
Spain	Remington	5	Block hinged to rear, supported by a cam.
Sweden	Do.	5	Do.
Switzerland	Vetterli	4	Sliding bolt (magazine gun).
Turkey	Martini-Henry	4	Falling block.
United States	Springfield	5	Block hinged to front.

It will be noticed that the Vetterli gun, used by the Italians and Swiss, is a repeater or magazine gun. It contains a supply of eleven cartridges, arranged in a tube running under the barrel, and forced by a spring into the loading position one by one, as the previously fired empty one is extracted. The arm can thus fire twelve rounds with great rapidity without reloading; it can also be used as an

ordinary breech-loader, a fresh cartridge being inserted at every round, and the magazine kept constantly full. This is no doubt a great advantage under certain circumstances, but entails grave inconveniences. Thus the Vetterli gun, with magazine full, weighs just half as much again as the Martini-Henry, and gives less energy to its bullet at the muzzle in the proportion of 5 to 8; a proportion which increases to the disadvantage of the magazine gun as the range increases. Still, for a *mêlée*, and at short ranges, the Vetterli is no doubt a very formidable piece.

These considerations have led the Government of the United States to make trials of a number of magazine guns, of which one, the Hotchkiss, has been selected for adoption. The working of it is shown in fig. 19. The magazine is contained in the stock, and holds five cartridges, a sixth being in the chamber ready for loading. These cartridges are the same as those used for Government Springfield rifles; they are pushed successively into the loading position by a spiral spring till the magazine is empty, or a fresh cartridge

FIG. 19.—Hotchkiss Magazine Gun.

can be inserted after each round as in an ordinary breech-loader. The action of bringing the knob-handle upright and withdrawing the bolt extracts and throws out the emptied cartridge to the side; the next cartridge is then pushed up into the loading position by the spring, and is forced into the barrel when the handle presses the bolt forward; this action also cocks the piece, but the striker cannot reach the cartridge till the knob-handle is turned down, and the bolt thus locked in position. The weight of the piece fully loaded is $9\frac{1}{2}$ lb. Trials of this weapon are about to be made by the English Government.

Of all the military rifles adopted by the various Governments, the Martini-Henry is the most powerful; the practical test it underwent in Turkey, where a cheap gun of this pattern was supplied on contract by an American firm during the war of 1877-78, was most satisfactory.

Pistols.—These handy little weapons were formerly made as single or double-barrelled smooth-bored muzzle-loaders, and their system involved no departure in principle from the ordinary firearm of the day. The introduction of the revolver as a practical weapon was a great step in advance; the idea is old, and roughly constructed weapons on the same plan have long existed in museums of old arms; Colonel Colt of the United States revived it, and is the father of the modern revolver. In his pistol a revolving muzzle-loading cylinder contains a number of chambers, usually five or six, bored from the front parallel to the axis; the back of the cylinder is left solid, and forms the breech; a nipple is screwed into each chamber. As the cylinder revolves, each chamber arrives at the top, and is then opposite to a barrel; the pistol is cocked by the thumb, an action which locks the chamber against the barrel, so that the two form a continuous bore; the trigger is pulled in the usual way, and the hammer brought down on the upper nipple, exploding the charge in the top chamber. The action of recocking brings the next chamber into

position. When on half-cock, the cylinder revolves freely. Since Colt's time great improvements have been made in these handy weapons; the trigger was made to cock the hammer, turn the cylinder, and fire the charge by one continuous draw; this arrangement enabled the shooter to fire all the shots very rapidly without lowering his hand: the strength of mainspring required, however, rendered it very difficult to shoot with any degree of accuracy, especially as the exact moment when the hammer would fall was hard to estimate. A second improvement gave the shooter the choice of cocking the hammer and firing it in the usual way, if he preferred it. The next step was to make the chambers breech-loading, by boring them right through, and packing the powder and bullet in a strong based cartridge, carrying its own ignition. In pistols constructed on this plan the chamber arriving at the top is brought against a false breech through which the striker is driven by the hammer. In the latest pattern of this pistol, the cylinder and barrel open away from the false breech on a hinge underneath; the action of opening throws out the empty cartridge-cases. If the user is on horseback, he thrusts the barrel muzzle downwards into his breast, belt, or holster, the hinge remaining open; fresh cartridges are taken out of the pouch and placed in the chambers; the breech is closed sharply on the hinge and is held by a snap-catch; the pistol is then withdrawn ready for use. All this can be very quickly done with one hand at full gallop.

MACHINE GUNS.

This term comprehends all weapons made to fire a rapid succession of bullets from a stand or carriage, so that, while requiring but two or three men to work them, they may throw in a fire equal to that of a detachment of infantry. In the Franco-German war of 1870 a species of *mitrailleuse* was largely employed, and when used under favourable conditions attained fair success. It consisted of a number of barrels (usually 25 or 37) secured in a frame round an axis, and parallel to it. The barrels were open at the breech, and were loaded by a disc pierced to correspond with them containing a cartridge in each chamber. This disc was placed against the breech end of the barrels, the false breech containing the strikers was

FIG. 20.—Gatling Gun.

held firmly against it, and the whole of the charges were exploded at once. This arrangement had many defects. The recoil of so many charges fired simultaneously required strength and weight; at short ranges the bullets all went to the same spot; the number of rounds could not be regulated at pleasure; and only volleys could be fired. The Gatling machine gun, which first appeared in the United States, was vastly superior to the *mitrailleuse*, and speedily obtained entrance into the armies of most of the civilized powers. Figs. 20 to 26 show the general construction of the weapon. In fig. 20 the Gatling is ready for firing. A block of ten barrels is secured round an axis, which is fixed in a frame *aa*. On turning the handle *b* (fig. 21), the

spindle *gg* causes the worm *f* to act on the pinion *w*, making the axis and barrels revolve. A drum *T* (figs. 20, 24, 25)

the carrier, which consists of ten grooves or chambers *M* (fig. 23) corresponding to the ten barrels. The construction of the lock is shown in fig. 26. It consists of a bolt, through

Fig. 21.

Fig. 22.

is placed on the top at the breech end of the barrels over a hopper, through a slot in which the cartridges drop into

Fig. 23.

Fig. 24.

Fig. 25.

which passes a striker driven by a spiral spring. AAAA is a cam, sloping as in the drawing, which it must be understood represents the circular construction opened out and laid flat. As the barrels, carrier, and locks revolve, the

FIG. 26.—Lock of Gatling Gun.

slope of the cam forces the locks forward and backward alternately. At position I the cartridge has just fallen into the carrier, the lock and bolt are completely withdrawn. At positions II, III, IV., the cam is forcing them forward,

so that the bolt pushes the cartridge into the barrel. At IV. the cocking cam *R* begins to compress the spiral spring, releasing it at V. Position VI. shows the cartridge just after firing; the extracting hook, omitted in the previous

positions, is here represented in the act of clutching the base of the cartridge case, which is withdrawn as the locks retreat down the slope of the cam, till at X it falls through an aperture to the ground. The line *ab* marks the commencement of the rifling. In fig. 20 the drum *T* consists of a number of vertical channels radiating from the centre. The cartridges are arranged horizontally, one above the

other, in these channels, bullet ends inwards. The drum revolves on the pivot *b* (fig. 23), and the cartridges fall through the aperture *B*. When all the channels are emptied, a full drum is brought from the limber, and substituted for the empty one. Each barrel fires in turn as it comes to a certain position, so that by turning the handle quickly an almost continuous stream of bullets can be

FIG. 27.—Nordenfelt Machine Gun. 1-10, parts of frame; 11, breech plug; 12, striker; 13, extractor; 14, cartridge receiver; 15-18, 23-31, lock and trigger parts; 19-22, locking action; 32-35, loading action; 36-39, cartridge receiver; 40, cover; 41-44, parts of hand-lever; 45-49, traversing action; 50-55, elevating and trailing action; 56, 57, hopper and slide.

ejected. An experimental pattern of Gatling has been lately tried, fitted with a multiplying arrangement which could be made to fire nearly 1000 shots a minute. In fig. 21 an automatic traversing arrangement is shown, which can be put in or out of gear as desired, and by means of which the amount of traverse can be regulated. The spindle *gg* turns the wheel *A*, projections on which act on

the arm *F*, and traverse the breech through a small arc, thus spreading the bullets laterally over the required front.

Effective though this piece is for land service, especially in defending approaches, it is scarcely suitable for the navy, as the mobility of the boats or vessels carrying it causes immense waste of ammunition, it being impossible to fire more than a few rounds at the object before an important

Fig. 28.

change of direction occurs. The Nordenfelt machine gun, shown in figs. 27 to 31, is found specially suitable under these circumstances. The barrels are here placed horizontally, and have no movement. A box containing the locks, bolts, strikers, and spiral springs, one of each corresponding to each barrel, moves straight backwards and forwards when worked by the handle of the lever on the right. When the box is drawn back the cartridges fall from the holder on the top into the carriers simultaneously. When the box is pushed forward the bolts push the cartridges into the barrel, cocking-catches compress the spiral springs, the lever releases the catches one after the

Fig. 29.

other at very minute intervals of time, and the cartridges are fired in rapid succession. In this piece, careful aim can be taken from a moving platform, and at the right

Fig. 30.

Fig. 31.

moment the barrels can be fired at the object almost simultaneously; they could be made to fire at the same instant,

but in this case the advantage of being able to fire single shots would be lost, and the recoil would be increased. This gun would probably never be able to fire with such extreme rapidity as the experimental form of Gatling mentioned above, but it could be made to fire six or seven hundred rounds a minute. It is generally considered that a machine gun should be able to fire easily two hundred rounds in half a minute.

ORDNANCE.

The manufacture of ordnance is a much more scientific and complicated study than that of small arms. As the forces increase in magnitude and intensity, while the ultimate strength of material remains constant, the nicety of adaptation of means to ends grows *pari passu* with the guns. In producing a piece of ordnance, two distinct sets of conditions are involved—those belonging to its actual construction, and those by which its proportions are regulated. In constructing a gun, the material must be so selected and disposed as economically and safely to sustain the effect of the forces developed by the charge; in designing a gun, it is necessary to know the nature and direction of the forces which will combine to produce the desired ballistic results. The two sets of conditions are as distinct as those involved in the separate operations of writing and printing this article.

CONSTRUCTION.—Nearly all the accurate knowledge as yet obtained of the true action of gunpowder has been acquired within the last twenty years. The general idea previously held was that the explosion was instantaneous, and that the more violent the powder the greater would be the velocity of the projectile. The mode of proving the quality of the explosive was to place a small quantity in a short mortar, and to measure the distance to which it projected a light shell—a test altogether wrong in principle, as will be shown later on. No accurate idea had been formed of the true pressure of the powder gas on the bore during discharge; but it was understood that a gun was subjected to two principal strains or stresses—a circumferential tension tending to split the gun open longitudinally, and a longitudinal tension tending to pull the gun apart in the direction of its length.

When guns are made of cast metal, and are, in fact, homogeneous hollow cylinders, a limit is soon reached beyond which additional thickness is practically useless in giving strength to resist the circumferential tension. Supposing the metal employed to be incompressible, each concentric layer would take up a strain on discharge inversely proportionate to the square of its distance from the axis of the bore. Every metal, however, is compressible as well as extensible, and hence the exterior always affords more support to the interior than the foregoing rule indicates. The great aim then of a gunmaker is so to select and arrange his material that the exterior shall take up as much as possible of the strain thrown upon the interior.

In America, Captain Rodman introduced a method of casting guns hollow and cooling them down from the interior, so that the inner portions being first solidified were compressed and supported by the contraction of the outer parts when they subsequently cooled down. Thus, on discharge, the compressed inner portions expanded under the action of the powder gas to or beyond their natural diameter, throwing at once the strain on the outer portions which were already in a state of tension. But however well cast-iron may be disposed, it is naturally too weak and brittle for use with heavy guns, and those nations which employ it thus do so because it is comparatively cheap and easy to manufacture, and not because it is the best material. Austria and Russia have of late years made light guns of

bronze cast in chill, and subjected to the wedging action of steel mandrils driven through the bore. The several layers of the metal are thus placed in a state of tension as regards the exterior, and of compression as regards the interior. At the present day systems of building up guns have been devised so that each portion of the metal is made to bear its fair share of the strain.

The longitudinal tension is usually less important than the circumferential stress. It is considered to be provided against in homogeneous guns if the metal is as thick over the bottom of the bore as round the end. The strain is now measured by calculating the total pressure of the powder gas on the bottom of the bore, and comparing it with the area of the transverse section of the gun at the same place. This is not absolutely correct; but, practically, the chief modes of gun construction now adopted leave a considerable margin of strength in this direction.

Sir William Armstrong first successfully employed the principle of initial tensions for all parts of a gun. In his system, wrought-iron coils are shrunk over one another, so that the inner tube is placed in a state of compression and the outer portions in a state of tension, an endeavour being made to so regulate the amount of tension that each coil should perform its maximum duty in resisting the pressure from within. Further, he arranged the fibre of the several portions so as to be in the best positions for withstanding the pressures. It must be noted that wrought-iron bar is about twice as strong in the direction of the fibre as across it. He therefore constructed the exterior of the gun of coiled bars of wrought iron welded into hoops and shrunk one over the other, thus disposing the fibre to resist the circumferential strain. These outer coils were shrunk over a hollow cylinder of forged iron, having the fibre running lengthways so as to resist the longitudinal strain. Within this cylinder or forged breech-piece was placed a steel tube, gripped in like manner by shrinkage. This grand principle of modern gun construction is carried out by turning the inner coil in a lathe to an exterior diameter slightly greater than the interior diameter to which the outer coil is bored. The outer coil is expanded by the application of heat, and slipped over the inner one. It contracts on cooling, and if the strength of the two coils is properly adjusted, the outer will remain in a state of tension, and the inner in a state of compression. On this view, the ideal gun would be constructed of a vast number of excessively thin rings so shrunk over each other that, on discharge, each should be equally strained. An attempt has been made by Mr Longridge, M.I.C.E., to approximate to this condition by winding steel wire under tension round a steel tube. This system, though possessing much ingenuity, has never made way, and might possibly be found wanting in longitudinal strength.

Great success attended the early introduction of the coil principle. Guns of considerable size were made; the largest weighed as much as 23 tons, and projected a 600-lb shot with a fair velocity. It was found, however, that much difficulty attended the accurate shrinking of a number of thin rings, and that occasionally one or more of the outer ones would be strained to cracking, while the inner ones were intact. The original mode of construction was therefore modified, as experience was gained in the Government factory at Woolwich. Acting under General Campbell, R.A., Mr Fraser, M.I.C.E., thickened the coils, and extended their use to the breech-piece, it being found that the longitudinal disposition of the fibre in that part was not required to sustain the longitudinal strain, and that the steel tube forming the bore was better supported by coils.

The manufacture of ordnance at Woolwich and Elswick may be briefly described as follows. Steel cylinders, slightly larger than the exterior dimensions of the inner

Construc-
tion.

Homo-
geneous
guns.

tubes, are supplied by contractors. They are tested for quality of metal, and toughened after being bored by being raised to the temperature shown by the tests to be most suitable to the particular cylinder, and then plunged in oil. They are subsequently tested by water pressure at 4 tons

Fig. 32.

per square inch. The tubes are not bored quite through for muzzle-loaders; a solid end is left to form the bottom of the bore. The rest of the gun is made of wrought iron. The material is chiefly received from the contractor in the form of wrought scrap, but a certain proportion of iron

Fig. 33.

puddled in the works is used also. Blooms of these materials are rolled into flat bars, which are fagoted together and rolled into long bars of the section required for the part of the gun for which they are intended. These bars are then placed in a long narrow reverberatory furnace,

Fig. 34.

and raised to a bright red heat. When ready for coiling, one end is drawn out and fixed to a revolving mandril, which pulls the bar out and winds it into a coil, like rope round a capstan. Sometimes a second bar is wound round outside the first coil; in this case the mandril is made to

Fig. 35.

revolve in the opposite direction. The coil is next placed upright in a reverberatory furnace, and raised to a white or "welding" heat. In this state it is placed under a steam hammer, and welded till it becomes a compact hollow cylinder. On cooling it is bored and turned to the proper

Fig. 36.

dimensions. Two parts of the gun are made of forged iron (not coiled),—the caseable screw which supports the breech end of the tube, and the hoop which carries the trunnions. The latter is either welded to the outer coil or shrunk on.

Figs. 32-39 show the method of building up Woolwich

Fig. 37.

ordnance as exemplified in the 80-ton guns. The various coils are hooked together by shoulders to prevent slipping or distortion from the shock of discharge. Thus, in fig. 36, shoulders are turned on the exterior of the breech-piece and inside the 1B coil; the latter is expanded by being raised to a dull red heat and slipped over the tube from the muzzle end. The expansion enables the shoulders to pass,

and on cooling they grip each other as shown, while the 1B coil contracts on and slightly compresses the part of the tube within it.

A method of strengthening and utilizing as rifled guns some of the old cast-iron ordnance of the service has been largely employed to supply pieces of secondary power and excellence for land fronts and for practice. It was brought forward in its present shape by Sir W. Palliser in 1863, and is now being much used in the United States' gun factories. The cast-iron block or gun is bored out to the

Fig. 38.

requisite dimensions, and a tube of coiled wrought iron is thrust into it; no shrinking is here employed, but a tolerable fit is ensured by accurate turning. When fitted, the tube is secured by a collar screwed in at the muzzle; a plug of iron passes through the under side of the gun into the tube near the trunnions to prevent any shift of position. The tube is in two parts, the breech end being turned down and a second tube shrunk over it. The bottom of the bore is formed by a wrought-iron cup, which is forged and stamped into shape under a steam hammer. A screw is

Fig. 39.

cut on the outside of the cup and inside the end of the tube; the cup is then screwed tightly home. The tube is next severely tested by water pressure, after which the second tube is shrunk on. The whole tube is then fitted into the cast-iron casing, the greatest care being taken that the breech end bears firmly home. The gun is now ready for rifling, and, after that operation is performed, undergoes proof by firing heavy charges, which expand the tube closely against the cast-iron envelope, which then takes up the strain and affords the necessary support. The relation between the powers of the three classes of guns will be gathered from the following comparison:—

Nature of Gun.	Weight of Gun.	Weight of Projectile.	Weight of Charge.	Calibre.	Energy of Projectile at 1000 yards.	Energy of Projectile at 2000 yards.

The great German gunmaker, Krupp, employs nothing but steel in the manufacture of his ordnance. His earlier pieces were bored from solid blocks of this metal forged under heavy hammers. They were homogeneous, and therefore the exterior did not assist the interior to bear the strain of the powder gas on discharge to the extent which scientific methods of construction admit. Still the excellent quality of the material enabled the artilleryist to get results from these pieces which have been surpassed only by the coil guns, and by Krupp's later productions. As, however, progress was made and the ratio of power to weight increased, it was found necessary to introduce a system of building up for steel ordnance also, and Krupp adopted the principle of shrinkage to which the English guns owed so

much. The interior of the recent German gun is a steel tube as in the Armstrong construction, but it is very much thicker and forms the body of the piece, instead of being chiefly used to provide a sound surface for the bore. It is thickest over the powder and shot chambers, tapering towards the muzzle (fig. 40). Over the thickest part, and in some guns over a considerable portion of the chase, hoops of cast steel are shrunk on,—the shrinkage being adjusted

FIG. 40.—Section of Krupp Gun.

to bring the strength of the outer hoops into play to support the body of the gun on discharge. The number of hoops depends on the size of the gun and the severity of the strain it has to withstand; they are usually much more numerous than the English coils, and the section of a heavy Krupp gun presents somewhat the appearance of a stone wall. It is believed that the steel is not toughened in oil, but the details of manufacture have not as yet been made public.

Steel of the excellent quality employed by Krupp is undoubtedly a stronger material than wrought iron; its present trustworthiness is, however, of late date, and it has hardly gained the general confidence accorded to wrought iron. Possibly the method of construction adopted by Krupp, containing as it does a number of unwelded joints, scarcely permits the several parts of the guns to support each other as efficiently as is the case with the magnificent forgings of the coil system; be this as it may, the German pieces, though made of stronger and more expensive material than the English ones, are just as heavy for any given power, proportions and ammunition being similar.

In France and Italy a combination of cast iron and steel has been introduced with a view to economy. The interior of the gun is a moderately thick steel tube as in the coil guns; over this is a thick cast-iron body, corresponding to the steel body of the Krupp guns. On the exterior are shrunk steel hoops.

Sir J. Whitworth uses his fluid-compressed steel for the manufacture of ordnance. He forces massive hoops over a central tube, and over one another by hydraulic pressure or by shrinkage.

Mr Vavasseur employs Firth's crucible steel for his guns, which are built up somewhat in the same way as Krupp's. He also uses exterior coils of wrought iron in some patterns.

Systems of Loading.—The comparative advantages of breech-loading and muzzle-loading for ordnance on service are fully discussed in the article GUNNERY. We have now to mention the principal modes of closing the breech, either permanently as in muzzle-loaders, or temporarily as in breech-loaders. The former is comparatively a simple matter. When the whole gun, or the interior of it, is formed of cast metal, iron, bronze, or steel, the block is merely bored to the required depth, and the end left un-bored to form the breech. Should the inner part of the gun be formed of wrought material, such as coils, it becomes necessary to close the end with some device which shall render it gas-tight and strong. Several kinds of cups and plugs have been tried for this purpose, the most successful of which is the cup already mentioned in the description of the converted guns. When we come to the temporary closing of the end of the bore demanded by breech-loading, a far more difficult problem presents itself. This problem

has been more or less satisfactorily solved in a great variety of ways, but it will be sufficient to examine the three principal types or systems of breech-loading employed in modern artillery. They are popularly known as the Armstrong, the Krupp, and the French systems.

The Armstrong system is the earliest of these in point of date. In it a slot is cut through the top of the breech of the gun into the tube at A (fig. 41); a breech block (fig. 43), through which the vent is driven, is dropped into this

FIG. 41.—7-inch Armstrong Breech-loader.

slot, and is pressed firmly against the bore from behind by the breech screw (fig. 42), which is provided with two powerful lever handles for the purpose. Where the breech block, or vent piece, as it is usually called, presses against the lip of the bore, both surfaces are of copper, and are renewed from time to time as channels are worn through between them by the rush of the escaping powder gas. There are many guns, from 6-pounders to 7-inch, made on

FIG. 42.—Breech Screw.

FIG. 43.—Vent Piece.

this plan in the British service, and at the time of their introduction they constituted a great advance in gun construction. Experience in the field and at practice has, however, revealed many grave faults in them. No joint consisting simply of two abutting surfaces can be made so tight as to prevent the gas from escaping on the discharge of the piece; the pressure in the powder chamber is so great that a considerable expansion takes place for the moment, and permits a fan of flame to flash out. The eroding effects of gas in motion at high pressure are extraordinarily destructive, and constant necessity for repair arises from this cause. It has also been found that in rapid firing the breech screw may be too quickly forced home, nipping the vent piece before it has fallen into its proper position; the end of the bore is then not sealed, and important and perhaps dangerous accidents occur. Moreover, even with moderate-sized ordnance, the vent piece becomes too heavy for convenient lifting.

In the Krupp system (fig. 44), a slot is cut through both sides of the breech of the gun; in this slot, in the latest patterns, runs a cylindro-prismatic wedge, or, in other words, a wedge of D section, the round side to the rear. The flat side forms the bottom of the bore. For loading, the wedge is pulled out to the left side of the piece as far as the stop will allow it to go, the shell and cartridge are thrust up the gun from behind, the wedge is pushed in, and is pressed hard home and secured by an ingeniously-contrived screw with powerful handles. As was mentioned with regard to the Armstrong system, no amount of pressing home and securing would by itself be of any avail in pro-

venting-escape of gas at the breech, and a special arrangement is therefore provided for this purpose (fig. 45). The end of the bore is enlarged, and into the recess thus formed fits a Broadwell ring, against which the face of the wedge abuts when forced home. The ring is so formed that it must always fit against the wedge, and be pressed firmly to it by

FIG. 44.—Krupp's breech action, cylindro-prismatic wedge.

the action of the gas on firing. This is accomplished by making the recessed surface of the gun and the exterior surface of the ring portions of a sphere. In spite of the theoretical perfection of the system, and the excellence of manufacture attained, it has always been found that after a time—after firing a very variable number of rounds—gas would begin to escape, and then speedily cut a channel between the ring and the wedge. Krupp has fully recognized this, and has been successful in minimizing and localizing the injury thus caused.

The gas has two ways of escape: it can pass either between the ring C and the body of the gun D, and so out to Y; or from X to Y. Several forms of Broadwell ring have been tried by Krupp; the form shown in fig. 45 is now in use. When the gun is fired the gas acts on the rounded surface of the ring C, pressing it down hard against the facing-plate A, and also expanding it against the body of the gun D. The tendency

FIG. 45.—A, steel facing-plate; BB, copper discs; C, steel Broadwell ring; D, body of gun; E, wedge; X, interior of gun; Y, exterior of gun.

of the gas is also to expand the body of the gun away from the ring, and many bronze guns have been destroyed from this cause, having expanded more than the ring was able to follow. A recess is cut in the exterior of the ring, partly to give it greater spring and partly to afford a relief channel for any gas that may have forced its way in. The form of ring here shown appears to have overcome the efforts of the gas to escape in this direction.

Having stopped the gas from getting round the outside of the ring and injuring the gun, we have now to consider the results of escape from X to Y. A channel cut through here would disable ring and wedge, which, though not so bad as disabling ring and gun, would yet be productive of much inconvenience. The insertion of the steel facing-plate A at once saves the wedge and localizes the injury. It allows, moreover, of the introduction of copper discs behind the plate, for the purpose of making up for wear, compression of metal of wedge, &c. Two relief channels are cut round that surface of the ring which abuts on the facing-plate. Spare Broadwell rings and facing-plates are supplied with the guns; should wear set in and escape of gas ensue, the defective fittings can be removed from the gun and new

ones inserted in a couple of minutes. Each set should last on the average for several hundred rounds.

In the French system no slot is cut in the gun (fig. 46). The breech is closed by a screw plug from the rear, which swings on a hinge to the side when withdrawn. The male screw on the plug and the female screw in the gun are divided circumferentially into six parts, of which three have the threads cut away, so that the surface is alternately screw and plain cylinder. When the threads of the plug coincide with the plain parts in the gun, the plug can be moved straight in or out. When pushed in, one-sixth of a turn engages the threads, which thus give half the bearing of an ordinary screw. This is called the interrupted screw system. The plug is larger than the bore, so as to afford room for the shell and cartridge to be thrust in. The end of the bore is recessed to take a ring against which the end of the plug abuts, somewhat as in Krupp's guns; or a cup of steel is fixed on the end of the plug, which is slightly convex; the pressure of the gas drives the flat back of the cup firmly against the convex surface, bending out the lips, which are at the same time pressed against the sides of the gun by the gas. This method has been lately introduced by the Elswick Company.

FIG. 46.—French breech action, interrupted screw.

It is difficult to award superiority to the Krupp or the French system. Each appears to possess some little advantage over the other, and both have attained great success. The Krupp system has undergone the more thorough testing in the field, and has the merit of allowing the parts which become damaged by the escape of gas to be replaced with greater ease and quickness. The French system, on the other hand, takes up less of the gun, so that in a piece of given length the bore may be upwards of one calibre longer than with Krupp's. In the French system, also, the breech-fittings are less exposed to damage by the enemy's fire, being behind the gun instead of at the side.

DESIGNING.—A gun, like all other machines, must be designed to fulfil certain definite conditions. Its projectile may be required to pierce a given thickness of armour at a given distance; or weight of piece may be the limit, and it may be wished to throw the most powerful shell or shrapnel to a given distance with a given elevation, consistent with that limit. To work out problems of this nature, it is all-important to possess an accurate knowledge of the action of the charge inside the bore. By means of the Noble chronoscope and the crusher gauge (see GUNNERY), this knowledge is obtained, and we shall now explain how the indications of these instruments are employed to assist in determining the proportions of ordnance.

Gunpowder is not properly so much an explosive as a substance burning and giving off gas with great rapidity. It offers in this respect a marked contrast to gun-cotton, dynamite, and other true explosives. If one of these agents be detonated, the detonation is immediately carried through the mass, whatever its size, and the whole at once turns into gas. Gunpowder, on the other hand, as far as is known at present, cannot be detonated, but simply evolves its gas by burning in layers from the outside to the inside. Thus a large grain will take longer to burn up and become

Gun de-
signed

entirely converted into gas than a small one will; hence the effect of enlarging the grains is to render the action of the charge less violent, the composition of the powder being the same in all gun charges. The projectile is driven out of the bore by the pressure of the gas on its base,—that is, on an area which varies with the square of the calibre. The weight of projectiles of similar form varies with the cube of the calibre. Hence the larger the gun the heavier will be the column of metal or projectile driven by each square inch of its base; and the greater must be either the pressure applied, or the time of its application, if a given velocity is to be attained. The great object of the gunmaker is to obtain the highest possible ratio of muzzle velocity to breech pressure. His ideal would be a charge so arranged that a pressure equal to the amount the gun is constructed to bear should be uniformly maintained till the shot has left the muzzle. Science is still a long way from this, but has done a good deal towards it in the last few years. A charge of gunpowder, composed of service ingredients in service proportions, exploded in a closed vessel at a density of 1.00 (equal to that of water), sets up a pressure of 43 tons per square inch; at a density of 0.75, of 23.2 tons; at 0.50, of 11.8 tons. Supposing a gun cartridge to be rammed home to the density of water, and entirely converted into gas before the projectile began to move, the pressure in the bore would rise to 43 tons per square inch at the breech, and fall towards the muzzle, as the travel of the shot afforded increasing room for expansion behind it. The column of metal to be moved, even in the heaviest projectiles yet known, is only a few pounds to the square inch of base, while the maximum pressure of the powder gas is measured in tons; it is clear therefore that the shot must get under way at some period antecedent to the setting up of the maximum pressure. In a breech-loader, where the projectile has to be forced through a bore slightly less than its greatest diameter, it will be detained longer than in a muzzle-loader, where it moves freely away, but the difference is insignificant as regards the present argument. The result of the shot's early motion is that space is at once given for expansion, and the normal 43 tons is never reached. Before these matters were fully understood, badly-proportioned charges of violent powder were found sometimes to set up what are known to artillerymen as "wave pressures," which were dynamical in character, being caused by rushes of gas

from one end of the charge to the other, so that the gauges indicated far higher pressures at the ends of the powder chamber than in the centre. This has now been overcome, and a great increase of both power and safety has been obtained. Several important improvements have been made of late years; the principal ones are three in number:—(1) a great stride was made in the manufacture of powder when pebbles, prisms, and $1\frac{1}{2}$ -inch cubes were introduced; (2) the discovery of the beneficial effect of "chambering," that is, of boring out the powder chamber to a greater diameter than that of the rest of the bore; (3) the method of "air spacing" the cartridge, so that a certain weight of powder should have a certain definite space allotted to it, irrespective of the actual volume of the powder grains. Thus in the 80-ton gun powder cubes of $1\frac{1}{2}$ in. edge are used, having an absolute density a little over 1.75, or about 15.7 cubic inches to the pound. If these grains were rammed tightly home in a silk-cloth bag, the space occupied behind the shot would be 24.6 cubic inches per pound; as actually used, an air-space over and within the cartridge is left, so that the space behind the shot amounts to 34 cubic inches per pound. This density would set up a pressure in a closed vessel of 26.6 tons per square inch, but the relief afforded by the shot's motion reduces it to about 19 tons per square inch. The effect of chambering out the end of the bore where the powder lies is practically to permit a small gun to consume effectively the charge of a larger one. The cartridge is shortened, and the mechanical conditions of burning are greatly improved, so that, with large charges, higher velocity with lower pressure is obtained from a chambered than from an unchambered gun. The above information is derived from the indications of the crusher gauge, which registers the pressure of the gas at various parts of the bore. The chronoscope measures the rate at which the projectile acquires velocity during its travel from the breech to the muzzle. Knowing the increment of velocity at any point, we can calculate the amount of pressure required to produce this increment, and thus confirmation is obtained of the accuracy of the records obtained by the crusher gauge. The following table gives the increase obtained at successive stages in the development of the power of the 80-ton gun, which was first under-bored for experiment, and gradually brought to its present dimensions:—

¹ Mild prismatic powder (German).

It will be observed that each improvement has tended to facility of consumption of increased charges, so that, while the pressures are diminished, the penetrating power of the projectile is augmented, a heavier and more destructive shell being driven through thicker armour.

The manner in which the various principles, of which an explanation has been above attempted, are practically applied is laborious and complicated; the conditions are often conflicting, and the ultimate dimensions of a piece of ordnance is commonly a compromise. A couple of simple examples will illustrate the *modus operandi*. Suppose that it is required

to design a gun which shall not exceed a given length, but shall throw a projectile capable of piercing a given thickness of iron at a given range. There are several formulæ of a more or less empirical nature for calculating the perforating power of a projectile moving with a known velocity. Penetration is by some regarded as a punching action, by some as a wedging action; probably it is a compound of the two. Recent experiments carried on with the very high velocity of about 2000 f. s. have thrown some doubt on the soundness of any of the formulæ. That generally used in England is as follows:—

Let W = weight of projectile in tons ;
 r = radius of do. in inches ;
 v = velocity of do. in feet per second ;
 $E = \frac{Wv^2}{2g}$ = energy of do. in foot tons ;
 t = thickness of plate perforated in inches ;
 then $\frac{E}{2\pi r} = 2.52t^{1.5}$.

This formula tells the gun-designer what energy is necessary to overcome the resistance of the plate. Guided by experience, he assumes for the moment a striking velocity; the other component of the energy, the weight of the projectile, is then directly arrived at. The proportions of armour-piercing shell are the same for all guns, so that the weight guides the dimensions, and the calibre of the gun follows. Should this appear to be in no way unsuitable to the length already laid down in the conditions, the gun-designer calculates the loss of velocity in the given range and from the striking velocity deduces the muzzle velocity and the muzzle energy. The excellent labours (*Researches on Explosives*) of Captain A. Noble, F.R.S., of Elswick, and Professor Abel, F.R.S., have shown how to calculate the amount of work done by a pound of powder for every volume of expansion its gas undergoes; the results of many careful experiments and much intricate calculation are embodied in the accompanying table, which

Work done by gun-powder.

affords the means of determining the total work performed by any charge in any gun. A certain portion of this work is expended in heating the gun and projectile, in giving rotation, and so forth; the remainder appears as the energy of translation of the shot on leaving the muzzle. Large guns realize a greater proportion of the total work than small ones; the gunmaker knows very approximately by experience what percentage may be expected from certain classes of ordnance with certain descriptions of powder. Roughly the factor of effect may be put within the following limits:—for mountain guns, 45 to 50 per cent; field guns, 60 to 65 per cent; medium guns, 70 to 80 per cent; heavy guns, 85 to 95 per cent. The method of calculation will be best understood from an example. Suppose a charge of 425 lb of P_2 powder is, to be fired from the 80-ton gun chambered to 18 inches diameter; the projectile weighs 1700 lb, and the space behind it is 14,450 cubic inches.

The whole content of the bore is 60,400 cubic inches, and the volume of the charge is (425×27.7) 11,773 cubic inches, the number of expansions therefore is 5.13; the table shows that powder gas expanding to this extent from a density equal to that of water can perform work amounting to 92.4 foot-tons per lb. Since, however, the charge burns up in and has to fill (425×34) 14,450 cubic inches before doing work, the energy due to this extent of expansion (1.227) is lost, and 17.7 foot-tons per lb must be deducted, leaving $(92.4 - 17.7)$ 74.7 foot-tons per lb as the total work the charge is capable of performing under these conditions. It is known from the preliminary tests of the powder that in the 80-ton gun between 92 and 95 per cent of the total work will be realized. Hence the energy of the projectile will lie between 29,210 and 30,155 foot-tons, and its muzzle velocity between 1531 and 1600 f. a. A reference to the table on p. 292 will show that the result actually arrived at lies nearly midway between these limits. In this manner the charge required to impart the necessary energy to a shot of given weight in a given length of bore, and, conversely, the length of bore which will contain the requisite number of expansions of a given charge, are easily found; hence the charge required to produce the necessary energy is readily found; the air-space and the dimensions of the powder chamber follow, and the inside of the gun is settled. The gun designer now has to put walls round his bore. Guided by the knowledge previously mentioned as derived from the crusher gauge and the chronoscope, he lays down the pressures at each point of the interior, and calculates the amount and strength of the metal to be used, according to the special system of construction employed, and thus the exterior of the gun is settled. To give another instance:—let it be required to construct the most powerful howitzer that can be made for the siege train. The conditions are given thus:—recoil (of piece only) must not exceed 20 feet per second; weight of piece must not exceed 70 cwt.; limiting purposes are to breach at 1500 yards, with not more than 5° elevation, and to bombard at 5000 yards, with not more than 35° elevation. A piece weighing 70 cwt. and running back at 20 f. a. velocity gives 156,800 units of momentum (in pounds and foot-seconds); the initial momentum of the gun in recoiling is practically equal to the momentum of the shot on leaving the muzzle. Hence the shell must have 156,800 units of momentum, which may be composed of high velocity and light weight, or low velocity and heavy weight. For breaching purposes, accuracy and penetration are essential qualities; a shell varying in length from two and a half to three times its diameter will be suitable for the purpose. We have now a neat problem in ballistics, viz., To find the calibre of a shell of the proper length, of such a weight that, with the muzzle velocity required to give a range of 1500 yards at 5° elevation, the muzzle momentum shall be 156,800 units. This problem is readily solved by the methods indicated in the article GUNNERY, and it is found that a shell 8.0 in. in diameter, weighing 170 lb, and having a muzzle velocity of 940 f. a., will be slightly on the safe side of the limits. Proceeding in a similar manner, a shell 8.0 in. in diameter, weighing 230 lb, starting with a velocity of 675 f. a., satisfies the conditions of bombardment. The calibre being thus settled, the proportions of the piece remain to be worked out. As there is no difficulty in obtaining a velocity so low as 940 f. a. with a small charge and low pressure, the length of the bore and the disposition of the metal can be adjusted to suit, not only the strain of discharge, but the conditions of service. In the gun now under consideration, the bore is made as long as possible, and the weight of metal thrown as far forward as possible consistently with preserving due strength at the breech. The reasons for this are threefold:—first, the longer

Example of designing.

the bore the less is the breech pressure required to produce a given muzzle velocity, and the less is the maximum strain thrown upon the studs, gas check, or other rotating agent; next, the more forward the general disposition of the metal, the farther from the breech end will be the centre of gravity, and consequently the trunnions,—a position which favours steady shooting and absence of jump; thirdly, a siege howitzer, being always fired under cover, is little exposed except near the muzzle, which should therefore be made as strong as possible to avoid injury from anything less than a direct hit by unburst shell.

Rifling.—Spherical projectiles fired from smooth-bored guns seldom or never pursue the mean trajectory. The centre of the ball's figure will rarely coincide exactly with the centre of gravity, and the pressure of the air during flight will then act with unequal effect on different parts of the surface. This inequality will be increased by accidental imperfections or roughness. The difference between the diameter of the bore and that of the projectile is termed "windage"; when this is considerable, it is a principal cause of error in shooting, as the ball rebounds from side to side against the walls of the piece as it is driven along, its actual direction of departure depending on the effect of the last bump before it leaves the muzzle. Accuracy of manufacture may greatly mitigate these errors, but will never entirely remove them; it is therefore found necessary to cause the projectile to rotate rapidly round an axis coincident with the axis of the gun; by this means the inequalities in the action of the pressure of the air, due to the imperfections above mentioned, take effect in all directions in turn as the projectile rotates, and hence neutralize each other. Extending this principle, the stability imparted to a shot by its moment of rotation is such that elongated projectiles can be employed and driven point first at high speed through the air. The course of the projectile from the time of its leaving the muzzle to the end of its flight belongs to GUNNERY (*q.v.*). Here we have to consider the modes in which the interior of the gun is made to impart rotation to the projectile. Rotation is usually expressed in angular velocity; a shot is said, in popular language, to make so many turns per second. Mathematically, the unit of angular velocity consists of rotation through the unit of circular measure in one second; the unit of circular measure is the angle subtended by an arc equal to radius, viz., $57^{\circ} 17' 44'' 48'''$. If we call this angle ω , a complete rotation will be expressed by $2\pi\omega$. In considering the energy stored up in a shot's rotation, or, what is the same thing, the work done in producing that rotation, the weight of the projectile W , and its radius of gyration ρ , must be taken into account. The energy of a travelling body is $\frac{Wv^2}{2g}$; the weight of a rotating one is supposed to be concentrated at the end of the radius of gyration; then if Ω be the angular velocity, the velocity of a travelling body will correspond with $\rho\Omega$ in a rotating one, and the energy of rotation will be expressed by $\frac{W}{2g}\rho^2\Omega^2$. The proportions of service projectiles differ for different guns, the thicknesses of sides and base and the shape of head varying; but roughly for common shell the value of ρ may be taken as $0.40d$ (d =diameter), for Palliser projectiles as $0.38d$, and for shrapnel as $0.36d$. For artillery purposes a projectile is said to turn once in so many calibres, that is, to make one complete revolution in travelling a distance equal to so many times the diameter of the bore. Supposing a given length of groove in the bore to make a known angle with a line parallel to the axis of the gun, determining the arc through which the surface of the shot must turn while advancing the length of the groove, it is evident that the angular velocity attained by the shot will entirely depend

on the velocity of translation or forward movement. Again, the greater the diameter of the bore the less will be the proportion borne by the arc turned through to the whole circumference; consequently the bigger the gun the less the angular velocity of the projectile, if the angle of rifling and the velocity of translation remain constant; the velocity of rotation of a point on the surface will, under these conditions, always be uniform. It is generally considered that with studded muzzle-loading service projectiles, having a length equal to about $2\frac{1}{2}$ to 3 times their diameter, the velocity of rotation of a surface point of about 110 f. s. is sufficient to keep them steady, allowing for loss of spin by atmospheric friction up to any probable range. Supposing the interior of the gun to be opened out and laid flat, the groove (of a uniform twist) will be straight, and since the shot guided by it makes a complete revolution in n calibres, the angle made by the groove with a line parallel to the gun's axis may be expressed by $\tan^{-1}\frac{\pi}{n}$. In designing the piece, the muzzle velocity is determined on, and also the velocity of rotation to be communicated to the projectile; the combination of the two fixes the final angle of the groove. Now it is easy to see that the spin of the shot on leaving the bore depends only on the conditions immediately preceding. The rate at which the work of giving rotation is done during the travel of the projectile from breech to muzzle is an entirely different question. If a shot be rotating, its tendency is, putting friction aside for the moment, to continue to rotate with the same velocity. No work is done in keeping up this rate of rotation, but work would be done in accelerating or retarding it. Thus in apportioning the work done on the shot in giving rotation at different parts of the bore, we have to consider, not the actual angular velocity, but the increments of angular velocity. The work then can be distributed at pleasure over the whole length of the groove, by varying the angle it makes with a line parallel to the gun's axis, as it runs along the bore. Supposing, as before, the interior surface of the gun to be opened out and laid flat, then OU (fig 47) will represent a groove having a uniform twist, that is

Fig. 47.

making a constant angle with a line OM parallel to the axis of the piece. O denotes the commencement of the rifling at the breech end of the bore, UPM the muzzle. Guns are rifled with any number of grooves exceeding two but it is not necessary to consider more than one. With the groove OU , every increment of angular velocity imparted to the shot is due to an increment in the velocity of translation; and therefore the pressure between the sides of the grooves, and the studs, gas check, lead coating, or whatever fitting on the shot is employed for the purpose, bears a constant relation to the pressure of the powder gas on the base of the shot driving it forward. The table given below shows the result of this with great clearness. In order to mitigate the unevenness of strain, recourse was had to the increasing twist; and a curved groove was employed which, when developed as in fig. 47, forms the parabola OP , beginning at the point O , parallel to OM , and terminating at P , parallel to OU . The equation to OU is $x = py$; that to OP is $x^2 = py$. Since OP is a parabola having its vertex at O , and since the tangent at P is parallel to OU therefore

UF = PM, which shows that the shot, though rotating in either case with equal angular velocity on leaving the muzzle, has, up to that moment, with the parabolic twist turned through an angle half as great as would be the case with the uniform twist. The table below exemplifies the principle on which curves of rifling are, or should be, constructed. The first three columns speak for themselves; the fourth is arrived at by multiplying the area of the shot's base by the gas pressure per square inch recorded on the gauges, and given in the 5th column. Columns 6 and 7 are worked out from formulæ due to Captain Noble of Elswick; in

column 6 the pressures due to a uniform twist are given. It will be seen that they bear a constant proportion to the pressures of the gas recorded in columns 4 and 5, and that the maximum rises to a considerable height soon after the shot has begun to move, while at the muzzle little work is done. In column 7 the calculations are made to suit a curve consisting of a portion of a parabola, starting from the vertex where the groove is parallel to the axis of the piece, and rising to the required twist at one foot from the muzzle, thence proceeding uniformly. In this curve the maximum strain is greatly reduced, the pressure gradually

rising with the increase of twist. The figures are derived from another formula worked out by Captain Noble. Column 8 shows the pressures required to give the necessary rotation when the curve of groove is a semicubical parabola, having for equation $x^2 = py$. In the instance chosen, the early part of the curve is rejected, and it starts from 1 turn in 200 cal., arriving at the required twist at a foot from the muzzle as before. The figures are derived from a calculation worked out on the principle devised by Captain Noble. Here the maximum is yet further reduced, and some approach to uniformity of strain is made. The diagram in Plate IV. shows the pressures graphically.

- Let R = rotation pressure between studs and grooves;
- G = gas pressure on base of shot;
- μ = coefficient of friction;
- h = pitch of rifling;
- k = tan. of angle made by groove with plane traverse to axis;
- ϕ = angle turned through by shot;
- θ = angle made by groove with line parallel to axis;
- ρ = radius of gyration;
- z = travel of shot along bore;
- v = velocity of shot;
- M = mass of shot = $\frac{W}{g}$;
- r = radius of shot.

Then in a uniform twist ($z = kr\phi$)

$$R = \frac{2\pi\rho^2(1+k^2)^{\frac{3}{2}}}{kr(k-\mu)+2\pi\rho^2(\mu k+1)} \cdot G;$$

in a parabolic twist ($z^2 = kr\phi$)

$$R = \frac{2\rho^2(4z^2+k^2)^{\frac{3}{2}}(Gz+Mv^2)}{kr^2(k-2\mu z)+2\rho^2z(2z+\mu k)};$$

in a semicubical twist ($z^3 = kr\phi$)

$$R = \frac{3\rho^2\left(G\sqrt{z} + \frac{Mv^2}{2\sqrt{z}}\right)(9z+4k^2)^{\frac{3}{2}}}{kr^2(4k-6\mu\sqrt{z})+3\rho^2\sqrt{z}(3\sqrt{z}+2k\mu)}.$$

Lieut Younghusband, R.N., gives the following formula, which is applicable to curves of any equation, and will be found much handier than the above by those familiar with differential calculus:—

$$R = \frac{\rho^2(G \tan \theta + \frac{d^2y}{dx^2} Mv^2) \sec \theta}{r^2(1 + \tan^2 \theta) - \mu \tan \theta (r^2 - \rho^2)} \sqrt{1 + \mu^2}.$$

A radical difference exists between the rifling of muzzle-loaders and that usually employed for breech-loaders. When the projectile has to be pushed down the gun from the front, it must be smaller than the bore; when it is thrust home from behind, it may be rather larger than the bore. Hence the earlier muzzle-loading shells were provided with ribs or studs which fitted in the grooves, and guided the projectile in its rotatory course; while the earlier breech-loading shells were coated with lead, into which the lands of the bore bit sharply as the powder gas forced the projectile between them. All rifled ordnance were formerly rifled with a uniform twist; indeed, it is clear that where ribs are cast or fixed on the projectile, or where they are formed in the soft envelope by the first action of the grooves, no alteration in the angle of rifling is possible, since the ribs can only make a constant angle with a line parallel to the axis of the piece, and cannot fit a groove making a varying angle with it. The smaller and earlier muzzle-loading rifled projectiles were fitted with two rows of studs, front and rear, and equal in size, so that a front and rear stud travelled in each groove, and practically constituted the ends of a rib. As the guns grew, it was found that the great strain of giving rotation at starting frequently forced the bronze studs out of the recesses machined for them in the sides of the shells, and scooped away the driving edges of the grooves even when the gun lining was of steel. The shell might have been cast with ribs on them, but certain difficulties of manufacture stood in the way, and the excessive strain would still have existed though its effects might have been mitigated. The increasing twist was therefore devised, and the rows of studs increased in number from two to three in the larger natures of projectiles. Three studs are allotted to each

groove; the rear one is the largest, the front one the smallest. They are so placed that the line of their loading sides is parallel to the angle made by the groove at the breach, while the line of their driving edges is parallel to the angle made by the groove at the muzzle. In Plate IV. fig. 1 shows their position when the shell is home, and also when about to leave the bore. Thus, theoretically, the middle and leading stud should never come into play till the last moment, and the rear stud should do all the work of rotation. Practically, however, the rear stud, being of bronze, wears down against the edge of the hard groove; the centre stud obtains a bearing; the rear continues, and the leading stud takes up its share of duty; so that all three really act during the passage of the projectile through the bore. This method of employing the increasing twist necessitates wide grooves, and is unsuitable for small guns. A different plan therefore was devised to meet their case. Two rows of studs, front and rear, were so arranged that each ran in a groove of its own. The curve of the grooves belonging to the rear stud began at 0° , and reached the final angle at a distance from the muzzle equal to the distance between the front and rear rows, after which it proceeded in a straight line. The curve of the grooves belonging to the front studs began at 0° , at a distance in front of the commencement of the other grooves equal to the distance between the rows, and reached its final angle at the muzzle. Thus the two curves were alike, but one was always a constant distance in front of the other, and every stud acted through the entire length. Fig. 2 in Plate IV. shows the position of the studs when the shot is home, and also when it is about to leave the bore.

Studs.

Muzzle-loading rifling had reached this stage of progress at a time when the great wear caused by the rush of gas over the shot necessitated the adoption of some method of sealing the escape. After many trials, it was found that a flanged copper disc fitted on to the base of the projectile would expand under the first pressure of the gas, and cut off the windage completely. This saved the wear of the guns, and added to their power. It was found, moreover, that the flanges of these "gas checks" expanded in the grooves, and being firmly attached to the shell afforded an additional means of giving rotation. The next step was to remove the studs altogether, using a smooth projectile, and substituting many small grooves for few large ones. This method of giving rotation has been adopted in all recently-designed pieces, and appears likely to give entire satisfaction. When muzzle-loading guns were first rifled, many attempts were made to give rotation by expanding projectiles, but they proved unsuccessful, because at that time the increasing twist was not known, and the action of a violent powder and the uniform twist was that the rotator had to expand into the grooves, and at the same instant to communicate a rapid spin to the shell. It was unable to combine these operations, and the projections driven out by the gas could never settle to their work, being constantly cut down by the edges of the grooves. The result was that the shell "stripped," and left the bore without regular rotation. In the case of the twist which begins at 0° , the projections have time to expand comfortably, and adapt themselves to the shape of the grooves before they are called on to perform the work of rotation. On the other hand, since the gas presses out the flanges against the bore and into the grooves, and affords them support in this position, it is desirable that its pressure should correspond with their pressure on the driving edges of the grooves. This would be exactly met by the uniform twist, but that is inadmissible for the reason just given. The parabola, on the other hand, throws the principal rotating strain forward towards the muzzle; where the gas pressure is least (Plate IV.). The case is practically met by the semicubical parabola, which is the curve adopted

Gas checks

in the 80-ton gun. While progress was thus being made in the rifling of muzzle-loaders, the rival system had not remained inactive; the use of lead coating had been found to involve a loss of power in the projectile as regarded both the amount of bursting charge or bullets carried, and the penetration into armour, on to the surface of which the lead flew forward in a splash, when the shell struck. Moreover, the lead envelope would not lend itself to the exigencies of the increasing twist. To meet these difficulties, two undercut rings were machined round the smooth projectile, one near the base, the other near the shoulder. Into these slots were pressed stout copper wires, the rear one bringing up the diameter of the shell beyond that of the bore, so as to take the rifling when forced through the piece on discharge, the front one just fitting the lands, but not entering the grooves, so as to rotate irrespective of them, and thus keep the fore part of the shot steady. Projectiles thus fitted are more effective than the lead-coated ones, and are adapted to any twist of rifling. The latest breech-loaders made by the Elswick Company use the new arrangement described above for muzzle-loaders—the smooth shell with a gas check on the base. This appears to be the best form of projectile, and has the advantage of suiting either system. A few words on the section of groove best suited to various purposes will conclude the subject of rifling. The rotation is impressed on the projectile by a force acting tangentially to the surface. This principle would be represented in its extreme form by making the section of the shell to resemble a cog-wheel, the grooves and lands of the gun being bored to fit. With muzzle-loading systems where windage has been necessary, the sides of the projections on the projectile and of the grooves in the bore, have been sloped to enable the projections to run up the sides of the grooves, and so distribute the windage equally all round. The extreme form of this principle is Lancaster's oval bore, the section of which departs but slightly from a circle. All attempts at "centring" the projectile by sloping the bearings tend to convert it into a wedge, which expends that part of the force resolved radially in a crushing action on the shell, and a rending action on the gun. The slope may, however, be made of such a degree as to cause the projectile to centre fairly without exercising any important effect on the bore. In breech-loading systems, where the lands bite into the rotator, the driving edge strikes the projectile in, or nearly in, the prolongation of the radius, care being taken that the points of action are as many as possible consistently with leaving enough material between to stand the wear and the strain. Where gas checks expand in the grooves, these should be broad and flat, so that a complete fit and a strong projection should result. The driving edges should here also form a prolongation of the radius of the projectile.

Conclusion.—What may be the future of firearms it is impossible to predict, but it seems probable that the limit of power will be found to lie in the recoil. For shoulder guns, methods of withstanding increased velocities may be devised, but the weight of springs, pads, &c., will prevent the soldier or the sportsman from carrying this principle very far. For ordnance, the field artillery appear even now to be very near the limit of what power can be gained consistently with high mobility. Siege and heavy guns will no doubt gain by the increased application of hydraulics; but it is difficult to see how progress can go much further except in the matter of size, to which there appears to be practically no limit. Accuracy may be improved by more perfect methods of range finding, but, as regards the actual shooting of the guns, it is already in advance of the difficulties of atmospheric irregularity, which affects the smaller projectiles greatly. The reader who wishes to study the subject closely and technically is referred to the list of works given at the end of the article on GUNNERY. (E. M.)

IN its early days this science might have been simply defined as the art of determining the motions of projectiles discharged from pieces of ordnance; in its present state it includes also the employment of projectiles specially adapted to the purpose in view, and the manipulation of artillery so as to enable the projectiles to produce the maximum effect.

Theory of Gunnery.—Instruments of great precision, mechanical construction of much accuracy, and a considerable knowledge of the higher mathematics are necessary to obtain and make use of trustworthy data for the establishment of sound principles on which to base the theory of gunnery. It is therefore not surprising that, owing to the early discovery of gunpowder, the art was long practised in a rude manner, without any attempt being made to reduce it to a science. Thus, though firearms appear to have been in use from the early part of the 14th century, little of value was understood of the laws regulating the flight of projectiles till the time of Nicholas Tartaglia, who published a treatise on the subject at Venice in 1537. About sixty years before that date, Leonardo da Vinci had enunciated some of the mathematical principles of trajectories in a manner which shows him to have possessed far more insight than any of his contemporaries; but he did not pursue the inquiry, and Tartaglia may be regarded as the father of ballistics. He was a man of great talent and ingenuity, but unfortunately had no opportunities of observing artillery practice; he was unable, therefore, to bring his calculations and speculations to the test of fact, and failed to carry conviction to the minds of the philosophers of the age. Before his time it had been generally believed that a ball on leaving the bore of a gun proceeded for some distance in a straight path,—a fallacy which lurks in the phrase “point-blank,” not yet expunged from popular speech. He saw, however, that “a piece of artillery cannot shoot one pace in a right line,” and propounded the axiom that “the more swifter a pellet doth flie, the lesse crooked is his range,”—a truth expressed at the present day by the statement that a high velocity gives a flat trajectory. This eminent philosopher claimed the invention of the gunner’s quadrant; he took into account in his calculations the resistance of the air, but placed the angle of elevation at which the maximum range would be obtained at 45°, which would only be the case *in vacuo*. Galileo was the next mathematician of note who investigated the subject. In his *Dialogues on Motion*, published in 1638, he recognized fully the resistance of the air, and pushed on the inquiry in the direction indicated by Tartaglia. It was not, however, till Newton’s time that a substantial basis was laid down for a true theory of gunnery. The grand discovery of the law of gravitation revealed the hitherto unguessed secret of the projectile’s fall to earth. The great improvements in mathematical methods of analysis invented by him rendered possible solutions of previously impracticable problems; while the splendour of his achievements in natural science stimulated philosophers of all countries. Towards the end of the 17th century he investigated the trajectory of a projectile on the supposition that the resistance of the air varied as the first power of the velocity. Bernoulli in 1718 gave a solution of the problem, on the supposition that the resistance varied as any given power of the velocity. This solution was, however, left in such a complicated state that no practical use can be made of it. No further progress was made till Benjamin Robins in 1742 published his *New Principles of Gunnery*, in which he furnishes a notable example of the manner in which theory should be

wedded to practice, and hypothesis to experiment. Had Robins been in the possession of accurate instruments he would probably have arrived at results of considerable correctness. He invented the ballistic pendulum, and was the first to ascertain experimentally with any degree of correctness the velocities of projectiles on leaving a gun. A “triangle” or gyn supported a pendulum of iron having a massive wooden bob; to the bob was fixed a steel ribbon which passed through a steel clamp set to the desired pressure. A bullet fired into the wooden bob caused the pendulum to swing; the length of the arc described was recorded by the steel ribbon; the weight of the bullet and the conditions of oscillation of the pendulum being known, the velocity of the bullet could be calculated from the length of the arc. The weight of Robins’s first pendulum was 56 lb, and it was therefore only suited for small arms. It could measure the velocity at only one point each round, and therefore, to ascertain the velocity lost by a ball in passing through the air, it was necessary to fire a series of rounds at one distance, and afterwards a similar series of rounds at another distance. Velocities of 1700 feet per second were measured, and the loss of velocity due to the resistance of the air, up to a distance of 250 feet from the muzzle, was approximately ascertained. Robins discovered that the resistance of the air was greatly increased as soon as the ball travelled faster than sound, and attributed it to the creation of a vacuum behind the shot, into which the air could not rush with speed greater than that of sound. Count Rumford in 1751 made use of the recoil to measure the velocities of bullets, on the principle that the momentum of the bullet forward was equal to the momentum of the gun backward. To carry this out, the gun was suspended as a pendulum, and the length of the arc it described on firing measured. By firing a bullet from a gun thus suspended into the ballistic pendulum, two independent records were obtained, and it would have been easy to calculate the loss of velocity, from the muzzle to any range at which the pendulum could be hit, by the combination. The roughness of the methods unfortunately did not permit completely satisfactory results. Dr Hutton next took up the inquiry, and increased the weight of the pendulum and the bullets. No very great advance, however, seems to have been made till 1840, when experiments on the resistance of the air to the motion of spherical shot were carried on at Metz by the French Government. MM. Piobert, Morin, and Didion were the chief experimenters. They raised the weight of the receiving pendulum to nearly 6 tons, and fired into it 50-pound balls at a range of 330 feet. The information now obtained spread over a much wider field than that traversed by Robins. It was even found possible to construct the trajectories of projectiles with some approach to truth, and empirical formulæ were laid down by which ranges and times of flight could be approximately calculated. It was not, however, till the introduction of electricity as a means of determining the velocities of projectiles that accurate knowledge of the resistance of the air was obtained. In 1840 Professor Wheatstone invented an instrument for this purpose, called the electromagnetic chronoscope. He has had many successors, whose productions exhibit a great amount of ingenuity; those from which the most valuable results have been obtained, and which are in use at the present moment, are the Bashforth chronograph, the Noble chronoscope, the Le Boulengé chronograph, and the Watkin chronograph.

The general principle on which these four instruments are designed is that a projectile after leaving the gun shall

sever a fine wire stretched across a screen, thus breaking an electric current, and causing a record to be made by the

two records are necessary to obtain a velocity, reading the time taken by the shot to pass between two screens, the number of points of a shot's flight at which an instrument is capable of indicating the velocity is one less than the number of screens employed. The chronograph invented by the Rev. F. Bashforth, late professor of mathematics to the Advanced Class of the Royal Artillery, is shown in fig. 1.

A is a fly-wheel, which, in revolving, carries with it K, a cylinder covered with paper specially prepared to receive the records of the clock and screen. B is a toothed wheel which turns the drum M and unwinds the string CD, thus allowing the platform S to descend slowly down the slide L. E, E' are two electromagnets, whose keepers are supported by the frames *d, d'*; *f, f'* are the ends of springs which act against the attraction of the electromagnets. There are two distinct currents—one through the screens and E, the other through the clock and E'. When these are interrupted, one by the shot cutting a screen, or the other by the clock beating seconds, so that the magnetism is destroyed, the spring *f* or *f'* carries back its keeper, which, by means of the arm *a* or *a'*, gives a blow to the lever *b* or *b'*, causing the marker *m* or *m'* to depart from the uniform spiral it has been describing—a spiral consisting of a double line running round the cylinder. The apparatus is adjusted so that the platform L, and consequently the markers *m, m'*, descend about $\frac{1}{4}$ inch for each revolution of the cylinder; the folds of the spiral are thus $\frac{1}{4}$ inch apart. The cylinder is made to revolve with considerable rapidity, so that the intervals between the successive clock marks indicating seconds measure from 20 to 25 inches; hence the screen marks indicating the moment of the severance of the wire by the shot can be allotted to their proper value in seconds with great accuracy. The screens are so contrived that the current, interrupted by the passage of the shot through one, is completed again before the next is reached. To accomplish this, the cutting of the wire is made to release a spring which makes a fresh contact; thus any number of screens can be used and a corresponding number of records obtained.

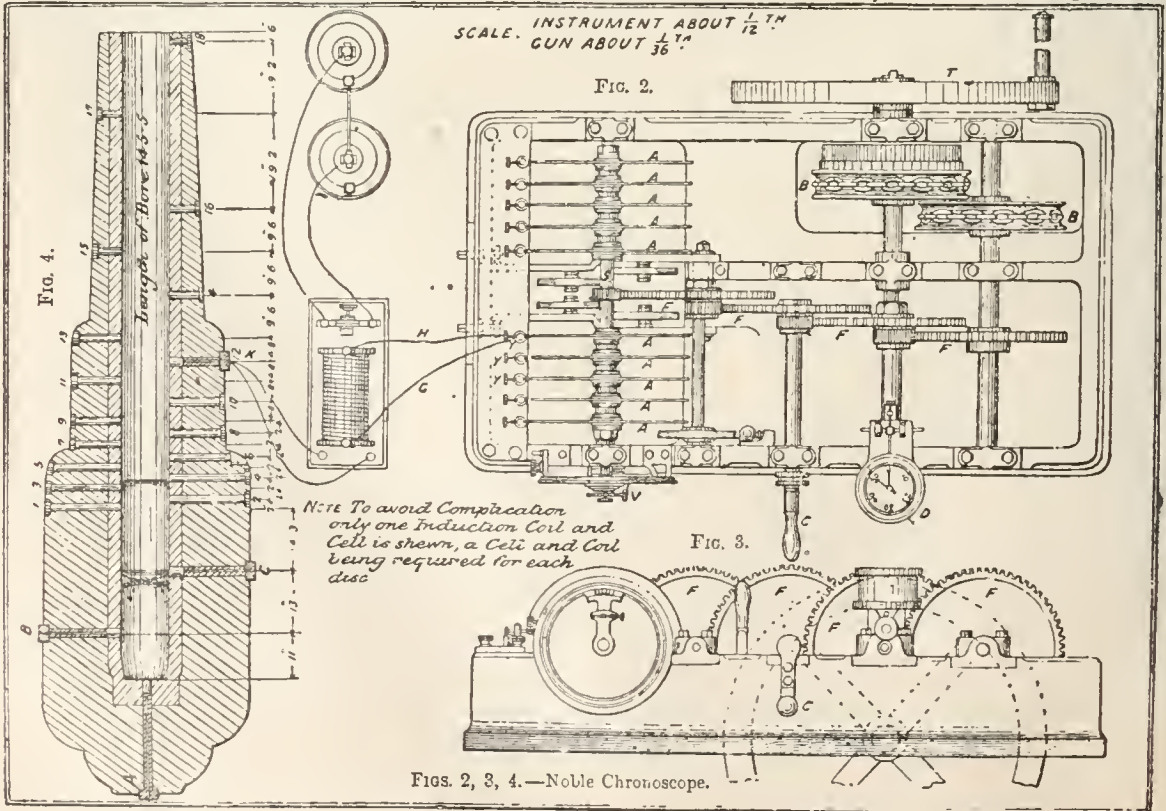

FIG. 1.—Bashforth Chronograph.

instrument at the moment. The Le Boulengé is connected with two wire screens only, the others with several. As

The chronoscope invented by Captain Noble of Elswick, late Royal Artillery (figs. 2, 3, 4), is constructed to furnish eight or more records, according to the number of discs, and is so excellently adapted for the measurement of exceedingly minute portions of time that it is usually employed to ascertain the velocity acquired by the shot in moving from a state of rest inside the gun at different parts of the bore. It is thus intimately connected with gunmaking,

bat, having the same character as other velocity instruments, is described here. The screens used for recording the flight of the shot through the air are now discarded, and the

FIG. 5.—Cutting plug, knife down. FIG. 6.—Cutting plug, knife up. "cutting plugs," shown in figs. 5, 6, 7, are substituted for them. In figs. 5 and 6 B is the bore, and A a flat-headed shot or cylinder passing along it in the direction of the arrow.

The plugs are screwed into the sides of the gun, as in fig. 7, which gives an end view of the bore. As the shot passes; its foremost edge pushes up the knife D; cutting the wire e, which passes in at one side of the plug C, then through a hole in the knife D, and out again at the other side of the plug. The ends of this wire are connected with the main wires leading to the instrument, and the

FIG. 7.—Cutting plug, ready for firing.

knife D, in cutting it, interrupts the current. Fig. 4 shows a 10-inch gun pierced to receive cutting plugs in eighteen places. The main wires run from a plug to the primary of a Ruhmkorff coil, fig. 2, near the instrument, with which the secondary communicates. Figs. 2 and 3 show the instrument in plan and elevation.

A, A are disks, 36 inches in circumference, fixed on a horizontal shaft S. This shaft is caused to rotate, so that the edge of the disks travel at about 1100 inches per second, by a series of toothed wheels F, F, gearing as shown, and worked into rapid motion by the handle C. This motion is kept up with regularity by the descent of the weight B acting on the hindmost shaft, the speed of which is multiplied 200 times at the shaft S. At V is a vernier, reading a graduated circle, which is fixed on the shaft S. The edges of the disks are covered with a coating of lampblack. One of the secondary wires G is brought from the coil, and placed in communication with the revolving disk; the other secondary wire H is fixed in a discharger Y, just clear of the edge of the disk. A stop-clock is placed on a stand D, and records the rate of revolution of one of the shafts. When the gun is fired the shot begins to move, and, as it travels along the bore, cuts the wires of the plugs in succession, breaking the primary currents, and causing sparks to pass in the secondary current from the dischargers Y, Y, to the disks A, A, which are in rapid revolution. The sparks burn off the lampblack and record their positions on the disks by a minute spot. Now if the shot could cut all the plug-wires simultaneously, all the spots on the disks would be in a straight line, but it does not do so, and during the intervals between the cutting of successive plug-wires the disks continue to rotate, so that the line of spots forms a spiral round the cylinder represented by the disks, as is apparent on bringing the machine to rest. The shaft S is then turned so as to place each spot in succession opposite an index, and the spaces travelled by the circumferences of the disks between the spots are read off on the graduated circle. As the circumference of the disks is made to travel at the rate of 1100 inches per second, and the vernier reads to thousandths of an inch, the machine indicates portions of time rather less than a millionth of a second; it is, in fact, practically correct to hundred-thousandths of a second. A millionth is about the same fraction of a second as a second is of a fortnight. Thus

the distance between two successive spots gives the actual time occupied by the shot in moving over the portion of the bore between two corresponding successive plugs, and therefore the velocity acquired at some point of this travel. As the increment of velocity is constantly decreasing after the charge is fairly lighted, the point at which the measured velocity is acquired is very slightly behind the middle of the space between the two plugs. The observations are worked out, accidental errors eliminated, and the results put in the form shown in column 3 of Table I.

The "crusher gauge" (fig. 8) is so closely associated in its use with the Noble chronoscope that it is convenient to give a description of it here, though its indications are

FIG. 8.—Crusher gauge.

valuable to the gunmaker rather than to the gunner. In fig. 4 are shown three plugs, A, B, and C, driven through the walls of the gun, and terminating flush with the bore. These plugs contain gauges for measuring directly the pressure of the gas on the surface of the bore. They are of the same diameter as the cutting plugs, and can be used in any of the twenty-one holes pierced in the gun. Fig. 8 shows the construction. The bottom of the plug is chambered out, and a steel anvil E is placed at the top of the chamber. Against this anvil is pressed a cylinder of pure copper A, carefully tested for quality, which is held in its place by a spring B. A piston C fits accurately the lower part of the chamber, any ingress of gas being prevented by the gas-check D, which is flush with the bore. When the gun is fired the powder-gas presses the piston hard against the copper cylinder A, which yields and becomes shorter, expanding laterally. The plug is then removed from the gun, and the nozzle unscrewed; the cylinder is extracted and measured. Its compression is compared with those given in a table constructed from experiment, and the pressure of the gas per square inch recorded. With the chronoscope the velocities are obtained directly from the time shown by the instrument to have been taken by the shot in passing over the interval between two cutter plugs. From these velocities calculation deduces the pressures required

Pressures and velocities inside bore.

to produce the increments of velocity. These calculated pressures are compared with and confirmed by those obtained directly from the indications of the crusher gauge. Table I. shows the nature of the information obtained from

the combination of the two instruments, when used with a 38-ton gun, firing an 800-lb projectile, with 130 lb of 1.5-inch cubical powder.

The last velocity is calculated from that taken by a Le Boulengé instrument outside the gun. This chronograph, the invention of an officer of the Belgian artillery, is shown in figs. 9, 10, and its mode of application in fig. 11.

FIG. 9.—Le Boulengé Chronograph, side view. FIG. 10.—Le Boulengé Chronograph, front view.

The shot, after leaving the gun, cuts the wire of the first screen, and subsequently the wire of the second screen. The wire of the first screen conveys a current through an electromagnet A (figs. 9, 10), which then supports a cylindrical rod C. This rod is sheathed with a zinc tube D, which is renewed from time to time as required; several short zinc tubes are slipped on, instead of one long one, if no great variation in the velocities is expected, so as to save material. Directly the first screen is cut, the rod C

FIG. 11.—Mode of using Le Boulengé's Chronograph.

which is called the *chronometer*, drops. The wire of the second screen conveys a current through another electromagnet B, which supports a much shorter rod F, called the *registrar*. The shot, in cutting the second screen, releases this short rod, which falls on a disk O, setting free a spring M. This spring carries a horizontal knife N, which flies forward and nicks the zinc tube covering the long rod. The nick made by the knife, if released while the long rod is still suspended, is the zero point. The currents from both screens pass through a disjunctor by which they can be cut simul-

aneously. When this is done the long and the short rods fall at the same moment. A certain time is consumed by the short rod in reaching the disk, setting free the spring, and cutting a nick on the zinc. During this time the long rod is falling into a recess in the stand, deep enough to receive its full length. The instrument is so adjusted that the nick thus made is 4.435 inches above the zero point, corresponding to 0.15 sec. This is the disjunctor reading, and requires to be frequently corrected during experiments unless the weather is exceptionally favourable to the electrical conditions. Instead now of using the disjunctor to cut both currents simultaneously, suppose the shot to cut them in succession; then the long rod will be falling for a certain time, while the shot is travelling from one screen to the other, before the short rod is released. The longer the shot takes to travel this distance, the farther the long rod falls, and the higher up on it will be the nick made by the knife. A simple calculation connects the distance fallen through by the rod with the time occupied by the shot in travelling over the distance between the screens, and hence its velocity at the middle point is known. A graduated rule is generally supplied with each instrument, arranged for a certain distance between the screens; from this any velocity obtained can be read off at once.

The electric chronograph, invented by Captain Watkin, R.A. is shown in figs. 12, 13, 14.

Watkin chronograph.

FIG. 12.—Watkin Chronograph.

Two brass cylinders A, A revolve on pivots B, B, C, C. Between them, at the top, hangs a brass weight (fig. 13), suspended freely by means of a piece of steel B, which pivots in another piece A let into the base of the weight. Two arms E enter, on falling, two V springs on the bed of the instrument, which catch the weight, A' finely-pointed brass wire, CD, enclosed through part of its length in an ebonite tube, passes through the upper end of the weight from side to side; the piece B of the weight is placed between the ends A, C of the lever arms of the holder (fig. 14). The arm CD pivots on the pin F; AB is fixed. K, K is an electromagnet; on its keeper H is fixed a strong spring G, G. When this spring is placed between the ends B, D of the arms, it forces the opposite end C to

press against A and to sustain the weight by gripping the piece B (fig. 13) of the weight. In this position the keeper H is at a short distance from the poles of the electromagnet. Directly the current is allowed to circulate, the keeper is attracted down to the magnet, the spring G, G is pulled away, a small spring L presses on the arm CD, the jaw AC flies open and the weight is released. The two cylinders A, A (fig. 12) form part of the circuit of a secondary induction coil. The screens are similar to those employed for the Bashforth chronograph; they are traversed successively by the shot, which momentarily interrupts the primary current, and thus causes an induced current to pass through the cylinders A, A. As these,

FIG. 13.—Weight.

FIG. 14.—Holder.

however, are not in electrical connexion, the current has to pass across through the brass wire of the weight, which is in the act of falling. The cylinders are covered with smoked paper, and the passages of the spark in and out leave minute spots showing the exact position of the weight at the moment: any number of screens may be used, and a duplicate record is obtained in one experiment of the space fallen through by the weight, while the shot is traversing each interval between the screens. As before, a simple calculation connects time and space, and an ingenious scale enables the experimenter to read off the velocities whatever be the distance between the screens.

In all these instruments slight errors exist, arising from mechanical imperfection, or from irregularity in the electric currents; still, the accuracy arrived at is sufficient for practical purposes, as is well shown by the following table:—

TABLE II.—Velocities of Martini-Henry Bullets fired with two different Charges, observed with several Instruments.

These instruments enable the experimenter to ascertain the velocity of a projectile up to considerable distances from the gun. With rifled ordnance no difficulty is found in hitting screens of moderate size at a range of 2000 yards; and, practically, the loss of velocity due to the resistance of the air can be determined for all ranges and all velocities.

It might be supposed that, having the means of acquiring this knowledge, the artilleryist would find little difficulty in solving the grand problem of his art, which may be thus briefly stated:—Given a projectile of known weight and dimensions, starting with a known velocity at a known angle of elevation in a calm atmosphere of approximately

known density; to find its range and time of flight, its velocity, direction, and position at any moment,—or, in other words, to construct its trajectory. This state of perfection has, however, not yet been reached; mathematics has hitherto proved unable to furnish complete formulæ satisfying the conditions. The resistance of the air to slow movements of, say, 10 feet per second seems to vary with the first power of the velocity. Above this the ratio increases, and, as in the case of the wind, is usually reckoned to vary with the square of the velocity; beyond this it increases still farther, till at 1200 feet per second the resistance is found to vary as the cube of the velocity. The ratio of increase after this point is supposed to diminish again; but thoroughly satisfactory data for its determination do not exist. From this it would appear that, as the motion of the shot increases in rapidity, the air finds continually greater difficulty in filling up the space left by the advancing projectile, but that, when once a point is reached where the vacuum in rear is complete, further increase of speed only encounters additional difficulty in displacing the air in front. The difficulty of meeting the conditions by mathematical formulæ is very great, since the velocity of the projectile changes continually, and moreover is resisted by air continually varying in density as the shot rises and falls again. It is evident that the greater the weight of a shot in proportion to the column of air displaced by it, i.e., to the square of its diameter, the less effect will the resistance of the atmosphere have upon its motion; thus very heavy projectiles moving with very low velocities will be but little retarded by this cause. It is desirable, therefore, before proceeding to explain what has been done towards Trajectory the complete solution of the problem above stated, to establish the limit, and investigate the trajectory when the resistance of the air is neglected.

FIG. 15.

Let v = muzzle velocity of projectile;
 ϵ = angle of elevation;
 t = time of flight.

Let the projectile start with velocity v from the point O (fig. 15) in the direction OM, so that MOX is the angle of elevation. Let OM be the distance which would be traversed in a period of time t , if gravity did not act. Draw ON vertically downwards, equal to the distance through which the shot would fall in time t under the action of gravity only. Complete the parallelogram OMPN. Then P will be the position of the projectile at the end of the time t . We have then—

$$OM = vt, \text{ and } ON = MP = \frac{1}{2}gt^2.$$

$$\text{Therefore } OM^2 = \frac{2v^2}{g}MP.$$

Since OM bears a constant ratio to MP, the trajectory is a parabola, having its axis vertical, and OM for a tangent.

Again, the horizontal velocity = $v \cos \epsilon$, and remains uniform; the initial vertical velocity = $v \sin \epsilon$, and is acted against by gravity. Then—

$$x = OQ = vt \cos \epsilon$$

$$y = PQ = vt \sin \epsilon - \frac{1}{2}gt^2.$$

Eliminating t , we get—

$$y = x \tan \epsilon - \frac{gx^2}{2v^2 \cos^2 \epsilon},$$

which is the equation to the trajectory, and is a parabola. To find the range, put $y=0$; the two resulting values of x give the position of the gun, and the end of the range, thus, $OR = \frac{v^2 \sin 2\epsilon}{g}$.

In Robins' experiments in 1742 and subsequent years, it became apparent that up to a certain point the resistance of the air increased with an increasing power of the velocity. Hutton in 1790 placed this point at 1600 f. s., and considered that the ratio decreased after this velocity was passed. He proposed as a formula for the resistance $R \propto av + bv^2$. General Didion, in 1840, deduced from the experiments at Metz the formula $R \propto av^2 + bv^3$. The experiments with rifled projectiles carried on at Gavre in 1861 led Professor Hélie to the conclusion that the resistance of the air at practical velocities was more nearly proportional to the cube of the velocity than to any other working expression. He constructed a formula for the trajectory by empirically modifying the formula given above for the path of a projectile *in vacuo* thus—

$$y = x \tan \epsilon - \frac{gx^2}{2 \cos^2 \epsilon} \left(\frac{1}{v^2} + \frac{kx}{v} \right);$$

from which he deduces an expression for the range which at low elevations for velocities between 800 f. s. and 1400 f. s. is very fairly accurate, and which furnishes the simplest method yet devised of roughly constructing a rangé table :—

$$r = \frac{1}{2kv} \left(\sqrt{1 + 2kv \frac{2v^2 \sin 2\epsilon}{g}} - 1 \right);$$

where

r = range in feet ;

v = velocity in feet per second ;

ϵ = angle of elevation ;

$k = 0.000000458 \frac{d^2}{w}$;

d = diameter of projectile in inches ;

w = weight of projectile in pounds ;

g = acc. of gravity = 32.19.

The above value of k is given for ogival heads ; with hemispherical, pointed, or flat heads a different coefficient of resistance would be required. The ogival is the form which suffers least retardation from the air. The most complete and valuable series of experiments yet carried out is that of Professor Bashforth (1865 to 1870) at Woolwich and Shoeburyness. He found that, velocities and forms being equal and similar, the resistance varies exactly as the square of the diameter of the projectile. He further arrived at the conclusion that between 900 and 1100 f. s. $R \propto v^3$, between 1100 and 1350 f. s. $R \propto v^3$, and above 1350 f. s. $R \propto v^2$. These results confirm in great measure those previously obtained, but unfortunately do not lend themselves readily to the construction of mathematical formulæ. Bashforth adopted the cubic law as his basis, as it offers the least difficulty in manipulation, and, putting $R = cv^3$, made the coefficient c a variable, the values of which he has tabulated. His method consists in building up the arc of the trajectory bit by bit, taking each portion so that a mean value of c for that portion may be used without important error. The path of the projectile may thus be constructed with almost any desired amount of accuracy, but the process is excessively laborious, and requires the use of a lengthy set of tables which cannot be reproduced here. For a complete knowledge of the subject the reader is referred to Mr Bashforth's work. Mr Bashforth, however, tabulated the loss of velocity due to the resistance of the air with regard to the time and distance of the shot's flight, and subsequent experiments carried out by the War Office in 1878-79 have now confirmed and extended the results he had previously obtained. As most of the problems of modern gunnery can be approximately solved by the use of these tables, we give in Table III. an abstract with explanation.

						2500	26696	34.166

The rate of loss of velocity is here inversely recorded for an ogival projectile having a weight in pounds equal to the square of its diameter in inches. Thus a 9-pounder shell of 3-inch calibre starting with a velocity of 2500 f. s. would retain a velocity of 400 f. s. at a distance of (26,696 - 5000 =) 21,696 feet after a time of (34.166 - 5.000 =) 29.166 seconds. As the value of $\frac{d^2}{w}$ decreases the resistance of the air retards the projectile less ; thus if the 3-inch shell weigh 18 lb it will overcome the resistance twice as well as the 9-pounder, since its $\frac{d^2}{w} = 0.5$ instead of 1.0.

Example 1.—The 80-ton gun fires at a vessel in motion at a range of 2000 yards. The muzzle velocity is 1580 f. s., the calibre 16 inches, and the weight of projectile 1700 lb. Required the velocity on impact, and the time of flight.

$$\text{Here } \frac{d^2}{w} = \frac{16^2}{1700} = 0.1506$$

$$0.1506 \times 6000 \text{ ft.} = 903 \text{ ft.}$$

Selecting the m. v. 1580 f. s. in the first column, the second column shows 23,519 ft. Subtracting, 23,519 - 903 = 22,616. Running up the second column and using proportional parts, this number corresponds to a velocity of 1383 f. s., which is the velocity on impact, showing the projectile to have lost 197 f. s. of its velocity during flight. In the third column, opposite 22,616 feet, we find 31.929 seconds. Subtracting this from the time opposite 1580 feet, and dividing by $\frac{d^2}{w}$, we have

$$t = \frac{1}{0.1506} (32.544 - 31.929)$$

$$= 4.084 \text{ seconds.}$$

Example 2.—An observer in an earthwork notes the flash of a hostile gun; in 3½ seconds the shell (blind) buries itself in the parapet, followed in half a second by the report of the gun. The shell is dug out, and found to weigh 60 lb, and to measure 15 centimetres in diameter. Required the range, the muzzle velocity, and the striking velocity.

The range is here given by the velocity of sound, which travels through air at an average rate of 1140 feet per second; so that

$$r = 3.75 \times 1140 = 4275 \text{ ft.};$$

$$\frac{d^2}{w} = \frac{(15 \text{ cm.})^2}{60} = \frac{(5.91 \text{ ins.})^2}{60} = 0.5821;$$

$$r \frac{d^2}{w} = 2488 \text{ ft., and } \frac{t^2}{w} = 1.892 \text{ sec.}$$

We have now to consider what muzzle velocity will cause the projectile to traverse the given distance in the given time. It must move at a mean speed of 1315 f. s. Assume the muzzle velocity to be 1600 f. s.; corresponding to this are found 23,607 feet and 32.599 seconds. Subtracting from these the reduced range and time, we have 21,119 feet and 30.707 seconds; if the velocity has been correctly assumed, it is clear that the range and the time of flight should result in the same terminal velocity. In the present instance, opposite 21,119 feet stands 1130 f. s., while opposite 30.707 seconds stands 1125 f. s. Thus it appears that the velocity has diminished more rapidly in the time travelled than in the distance travelled. This shows that it is assumed too high. Trying 1584 f. s., and proceeding as before, each column indicates 1120 f. s., which therefore is the terminal velocity, showing that the projectile has lost 464 f. s. of its speed during flight.

Drift.—Projectiles fired from rifled guns do not move in a vertical plane, but deviate to the right or to the left according to the direction of their rotation. All nations have adopted the right-handed twist, probably because it happened to be selected first. If the observer stands in rear of the piece and looks at the gun when fired, the projectile rotates in the same direction as the hands of a watch. It then steadily bears away to the right. The reason of this is not very clearly understood; in fact, two rival theories are put forward to account for it. If there were no resistance of the air, the path of the shot would be a parabola, and the axis of an elongated projectile would remain parallel to its original direction. The resistance offered by the air causes the axis to tend to assume a position tangential to the trajectory. On leaving the gun the projectile moves in the direction of its axis, which is also the direction of the axis of the gun. The action of gravity soon causes the path of the shot to make a small angle with the original direction of the axis; that is, the trajectory soon deviates from a straight line; the axis of the projectile is urged by the resistance of the air to accommodate itself to the new path, but as the path is constantly changing, the axis is always too late, since the rotation tends to preserve its parallelism. Thus there is always an angle—depending in amount on the velocities of rotation and translation, weight of shot, and density of the air—between the axis of the shot GB and the trajectory CD (fig. 16). Thus far both theories agree as to the facts, but they differ as to the deductions. The first view is that the resultant resistance of the air,

which has the effect of a force in the direction DC, tends to turn the shot about an axis passing through G, and perpendicular to the plane containing BGD, so that if the shot had no rotation, it would turn end over end. But as it has a right-handed twist, this motion is combined with that which the resistance of the air tends to impart to the shot, and the point A is therefore slightly deflected to the right at first. Continuing the action, the axis GA describes a cone about CD, rotating in the same direction as the shot rotates about its own axis. The resultant of the air's resistance tends to increase the angle BGD, therefore the shot will have a sinuous motion; but as the first deflexion

Fig. 16.

is to the right, and afterwards the point is more to the right than to the left, the deviation will on the whole be to the right. The other view is that, as the axis of the shot is always directed a little above the trajectory, the resistance of the air meets the surface on the under side, on which therefore there is more pressure than on the upper side. The consequence of this is that the friction of the air with the rotating surface is greater below than above, and therefore causes the projectile to roll bodily to the right while travelling forward. The path thus curves away from the vertical plane, and the resistance of the air tends to cause the axis to lose its parallelism with that vertical plane, though it is, as before, too slow in altering its direction to

FIG. 17.—Correction for deflexion.

become tangential to the curve described. Crucial experiments to set this point at rest are as yet wanting. The "drift" or "deflexion" is usually corrected in the British service by inclining the tangent sight. The result of this is that as the range increases, the higher the sight is raised, and the farther is the eye-notch to the left of the vertical plane containing the axis of the gun. In the German service the tangent sight is placed vertically in the gun, and the deflexion is allowed for by a graduated sliding leaf in the head. The same arrangement is used in those British guns, as the howitzers, which fire variable charges, as the slope of the tangent sight will accurately suit only one muzzle velocity.

To ascertain the correct slope, the actual deflexion is determined for each gun on the practice ground at various ranges with a vertical sight; then, in fig. 17, AD is the line of sight when the axis of the gun is horizontal. CD is the line of sight with a vertical tangent sight set at the angle of elevation ADC required for the range DF. Since the projectile deflects to the right, it is necessary that the line CD should point to E in order to hit F. This is accomplished by inclining the tangent sight AB, so that BC shall give the requisite allowance. The relation is thus established. By similar triangles,

$\frac{BC}{CD} = \frac{EF}{FD}$; then $BC = AC \tan BAC$, and $CD = AC \operatorname{cosec} ADC$, so that $\frac{BC}{CD} = \frac{\tan BAC}{\operatorname{cosec} ADC} = \frac{EF}{FD}$. Putting the angle ADC (the elevation) = ϵ , the angle BAC (the slope of the tangent sight) = θ , EF (the deflexion) = d , and DE (the range) = r , we have $\tan \theta = \frac{d}{r} \operatorname{cosec} \epsilon$.

The action of the powder charge, the travel of the projectile along the bore, the rifling, and, speaking generally, what takes place inside a gun when fired, are matters specially connected with the designing and manufacture of ordnance, and are therefore treated under GUNMAKING.

Projectiles.—The requirements of modern artillery have necessitated many complications in the preparation and use of projectiles, which now vary greatly in their nature and in the purposes for which they are employed. A general description of the several kinds supplied to European armies will be found under AMMUNITION, and but few remarks will be required to connect them with the guns for which they are intended. Smooth-bored ordnance use solid round shot and case, common shell, and diaphragm shrapnel shell. Solid shot are used against masonry, wooden shipping, and masses of men. They were at one time fired red hot at shipping. Roughly, the cube of the diameter in inches multiplied by 0.133 gives the weight of the shot in pounds. Case shot consist of iron balls packed in iron or tin cylindrical cases. They are effective up to about 350 yards against troops, boats, and rigging, and are especially suitable for flanking ditches. Common shell are completely filled with powder, and are burst in flight by time fuzes, or, on striking, by percussion fuzes. They are used against men in masses, buildings, works, and material generally. Diaphragm shrapnel shell contain a small bursting charge and a number of balls. They are fitted with a time fuze which explodes the charge when they near the object, so that the released bullets fly forward. They are very destructive against troops. In addition to the above projectiles, incendiary shells, called carcasses, filled with a violently burning composition, are thrown into villages and amongst shipping. Ground light balls oast among the enemy's working parties at night disclose their position. Parachute light balls contain a parachute tightly folded up, and a cup of illuminating composition; they are fired with a fuze timed to burst in the air, and they then remain suspended for a time, throwing a light down on the enemy's working parties.

The great advantage of rifling was long recognized in small arms and sporting pieces before it was extended to ordnance. The first rifled arms threw bullets which, except for certain projections designed to fit the grooves of the barrel, were spherical. These guns surpassed smooth-bores in accuracy, but it was not till the introduction of elongated projectiles that a distinct gain in power was recognized. The gain in accuracy is due in great measure to the superior correctness with which the ball is centred in the bore by the action of the grooves, while the rotation imparted to it annuls or greatly lessens the disturbing effect of the pressure of the air on surface inequalities, or of variations in the position of the centre of gravity. An elongated shot is also enabled to travel point first, or nearly so, and as the resistance of the air depends upon the area of the transverse section, a far greater weight can be given to the long than to the round shot without increasing this resistance. Thus, in addition to greater accuracy, rifling confers a flatter trajectory and greater penetration. The elongated form permits a head of the best shape, an increase in the contents of the shell, and the use of fuzes which explode when the point strikes an object. The projectiles used with rifled guns are case shot, common shell, shrapnel shell, and Palliser shell. The case shot differ little from those made for smooth-bore ordnance. Common shell are generally

from 2½ to 3 calibres in length. They are designed to contain as much powder as possible, consistently with strength of wall to resist the shock of firing. Their effect is almost entirely due to explosion; velocity has little to do with it beyond conferring range and penetration. Common shells are generally fuzed with percussion fuzes. They are effective for breaching, for setting fire to buildings, against troops if not much scattered, and especially against wooden or thinly plated vessels. The introduction of iron-clad ships is almost entirely due to the terribly destructive fire of shells. Shrapnel shell are filled with bullets, and have a bursting charge only sufficient to open the case and release the contents, which then fly forward with the velocity possessed by the projectile before breaking up. The bullets and fragments very speedily lose this velocity after separation. It is therefore most important to judge the range correctly and to form an accurate estimate of the practice, so that the result of each round may guide the aiming and timing of the next. When the shrapnel is burst in the air by a time fuze, it is exceedingly difficult to judge its precision by the puff of smoke. The splashes or puffs of dust of the bullets striking the ground should therefore be carefully looked for. When the shrapnel is burst on striking the ground by a percussion fuze, it is much easier to estimate the accuracy of the shooting, and it is common therefore to get the range by firing a round or two with percussion fuzes before setting the time fuzes. If the ground is hard and the distance of the enemy such that the shell strikes at but a small angle of descent, percussion fuzes generally burst the shrapnel better than time-fuzes, which, in their turn, have the advantage at long ranges and over soft ground. For field service time-fuzed shrapnel should be burst at from 50 to 100 yards in front of the object, and about 10 to 15 feet above the ground. The cone of dispersion of the bullets and fragments is considered to be so proportioned that the diameter at any point of the axis is one-third of the distance of that point from the burst or apex. To get satisfactory results from time fuzes it is necessary to have a gun which shoots with great regularity, a fuze composition which burns evenly, and an accurate mode of setting the fuze. Of late years improvements in powder and design of ordnance have rendered the velocities practically uniform. The fuze composition is somewhat liable to deterioration, but is tolerably satisfactory; and a new fuze auger has just been introduced which can be set to any desired degree of accuracy. As the power of shrapnel shell is entirely due to the velocity possessed by the bullets when freed from the envelope, it is of paramount importance in long-range firing that the shell should start with a high velocity and retain as much of it as possible. It is considered that with field guns the velocity of the projectile at the moment of bursting should not fall below 800 f. s., otherwise the contents will have a much diminished effect. The bullets themselves should retain a velocity of about 500 f. s. on striking to be thoroughly effective. With the more modern field guns the effective range of shrapnel extends up to about 3000 yards; with heavy guns to 4000 or even 5000 yards.

Palliser shells are made of a mixture of selected brands of iron, and are cast in moulds so constructed that the metal of the head is in contact with iron and that of the body with sand. The head is thus "chilled," as the rapid carrying off of the heat by the iron mould causes the particles of the metal to dispose themselves rigidly, and confers intense hardness, which property is essential for the penetration of iron plates. The head is of the ogival shape, that being found most effective in combining strength with sharpness (fig. 18). It is a moot point whether projectiles of hardened steel are more effective than those of chilled iron against armour. Probably the steel can get through a

greater thickness, but the damage done by the fragments of the Palliser after perforation is more serious. The cost of the steel shell is about five times that of the iron ones. The bodies are cast in sand, because extreme hardness is not there required, and a sounder casting is thus obtained. No fuzes are used with these shells; they are burst by the shock of impact on armour which explodes the powder charge. It is doubtful if they would explode on striking iron vessels not armour-plated, and they would fail to burst on striking wooden ships. They are effective in destroying masonry, and have been driven through great thicknesses of stone. They hold about a quarter as much powder as common shell of the same diameter. The greatest penetration of armour yet known was obtained by the 80-ton gun at Shoeburyness in 1877. The target consisted of four 8-inch wrought-iron plates, sandwiched with three 5-inch layers of teak, the whole put together with immense strength. The projectile perforated three plates and the teak, digging its nose about half-way into the last plate, which was much cracked and bulged. The 100-ton gun has perforated with ease 22 inches of solid wrought iron plate strongly backed, but failed to drive a hole through a similar target when the plate was of steel. Very recently extraordinary penetration has been obtained by a 6-inch 70-pounder made by Sir W. G. Armstrong & Co. Fired with a velocity of nearly 2000 f. s., this small projectile pierced about 11 inches of wrought iron. The subject of penetration is treated under GUNMAKING.

FIG. 18.—
Palliser shell.

A description of some of the fuzes and firing tubes used in gunnery will be found under AMMUNITION. The general principle guiding the selection of time or percussion fuzes is that when a shell is required to burst in the air a time fuze is employed, when on striking an object a percussion fuze is chosen. In muzzle-loading guns (not using gas-checks), time fuzes are ignited by the flash of discharge; otherwise the shock is taken advantage of to light the composition by exploding a detonator. Percussion fuzes are sometimes found to act too rapidly; where it is desired that penetration to a certain depth in earth or other material shall take place before explosion, it is found necessary to slow the fuze by interposing a small column of composition, burning for, say, a quarter of a second, between the detonator and the bursting charge. In firing a heavy shell with high velocity at a weak vessel, the resistance of the side is so slight that it may happen that the fuse either fails to act (the shell not being sufficiently retarded to set it in action), or explodes the shell after it has passed through both sides. To meet this case a specially sensitive and rapidly-acting fuze has been devised.

Guns were formerly primed with loose powder and fired by a match, next by common quill tubes filled with composition and ignited by a portfire, then by detonating tubes exploded by a hammer. Now friction tubes have superseded these methods for ordinary service. When it is desired to fire a gun from a distance, or to fire a number of guns absolutely at the same moment, Abel's electric tubes are employed. In them two fine copper wires pass down through the head, insulated by gutta percha, except at the ends, which are separated by $\frac{1}{16}$ th of an inch of a composition of subphosphide and subsulphide of copper with chlorate of potash. The other ends of the wires are in contact with the copper lining of two holes in the head. The wires from the battery are placed in these holes; when the current passes, the composition is heated to ignition and explodes the tube.

Service of Ordnance.—The general principles guiding the

employment and manipulation of artillery are applicable to the schemes of warfare of all civilized nations. Slight differences exist in calibres and weights; but it may be taken that the considerations which regulate the service of English guns have the same force elsewhere. The details of manufacture, the systems of loading, and the methods of rifling, are the chief points regarding which artillerists differ; these matters are treated under GUNMAKING. Of two pieces constructed with equal skill to perform the same kind of work, the heavier will always be the more powerful. Thus weight is the chief controlling element in the employment of guns, though cost and convenience of manipulation have often to be taken into account. The artillery of the present day is the outcome of a long series of improvements, and the whole system of this important arm bears traces of frequent modification and continual compromise. The first introduction of firearms appears to have taken place in England in the reign of Edward III. On the Continent it was probably somewhat earlier, but the actual date and the circumstances attending their introduction are involved in obscurity. It is said that cannon were used in the English expedition against Scotland in 1327, and at the battle of Crécy in 1346. In 1360 there were four copper guns in the Tower. For about two centuries cannon continued to be manufactured of copper, brass, or bronze, good castings of which were made long before the art of smelting iron ores was perfected. In the early part of the 16th century guns were sometimes made of wrought iron plates put together longitudinally and hooped with wrought iron. In 1545 cast iron ordnance were manufactured in England, and supplanted pieces of all other materials for a time. The growing needs of warfare, however, soon demanded guns possessed of fair mobility to accompany armies in the field, and the cast iron pieces used being found excessively cumbersome, bronze was once again resorted to for field artillery. From about the middle of the 17th century till the introduction of rifled cannon, all the heavier natures of ordnance—fortress, siege, and ship guns—were made of cast iron; and all the lighter—field and boat guns—of bronze. In 1717 the bronze foundry was established at Woolwich, and most of the smooth-bored field pieces, howitzers, and mortars used in the service were made there. The heavy cast iron guns were supplied by contractors, and proved by Government officials. The long peace which succeeded the Napoleonic wars was highly unfavourable to the progress of gunnery, but a great development took place in the arts and sciences, so that, on the breaking out of the Crimean War, the latest discoveries in metallurgy and the excellence attained in machinery at once enabled inventors to make a great advance in artillery. At the transition period, a few wrought iron smooth-bores, throwing spherical shot of 150 and 100 lb, were manufactured to overcome the resistance of iron plates then recently introduced for armouring ships. These pieces were speedily discarded for rifled guns; and practically it may be said that the adoption of steel and wrought iron for guns coincided with the change from smooth-bores to rifles, both steps of progress being thoroughly established about 1860. In spite of the great superiority of the new ordnance, it cannot be said that the old pieces are yet superseded; vast numbers of them exist over all parts of the world, and often form the only defence. Even the fortifications in England are still largely armed with them on land fronts; and though they are gradually disappearing, they yet claim notice. Bronze guns are now obsolete in the British service. Figs. 19 to 24 show typical kinds of cast iron ordnance. Those denominated according to the weight of their projectile are made strong enough to fire solid shot or shell; those called by the diameter of the bore fire shell only. It must be remembered that, with spherical projectiles, the solid must be heavier than the

Early
ordnance.

hollow kinds, which need not be the case with rifled ordnance, as the projectile may be of any length. The guns are used for direct fire, the howitzers for curved fire, the mortars for vertical fire, *i.e.*, they are set at 45° elevation, and the requisite range attained by varying the charge of powder, instead of firing at various degrees of elevation, as with guns and howitzers.

The old field smooth-bores were fairly effective up to 1000 or 1200 yards, and so established a great superiority over the smooth-bored musket; but as soon as the rifled musket was generally adopted, an advance in artillery power became necessary, if the arm was to retain its position in the scale of efficiency. After the Crimean War Napoleon III. rifled his bronze field guns on Treuille de Beaulieu's system, and the new pieces exhibited great merit at Magenta and Solferino in 1859. England, and indeed every

the Continental powers for the most part endeavoured to improve their methods of breech-loading. In 1872 the British wrought iron and steel muzzle-loading 9-pounder of 8 cwt. had been introduced into the service,

FIG. 19.—18-pounder Gun. A, button (eascable); B, breeching loop (do.); C, breech; D, base ring and ogee; E, vent-field; F, vent-field astragal and fillets; G, 1st reinforce; H, 1st reinforce ring; I, 2d reinforce; J, 2d reinforce ring and ogee; K, patch for foresight; L, chase; M, muzzle astragal and fillets; N, neck; O, swell of muzzle; P, muzzle mouldings.

FIG. 20.—8-inch Howitzer.

European power, was busily engaged in experimenting during this period. The early Armstrong guns in England, Broadwell's and Krupp's in Prussia, and imitations of the French plan in other countries, speedily caused field artillery to regain its place in war. The northern kingdoms of Denmark and Norway and Sweden, favoured by specially

FIG. 21.—32-pounder Carronade.

good iron ores, and free from the immediate alarm of war, retained cast iron as the material for light ordnance. Prussia had already begun to use steel for smooth-bores, and naturally adhered to it for rifled guns, while the coil system brought forward by Armstrong was found cheap and enduring in England. The new Prussian guns were breech-loaders, constructed on the double-wedge system; they proved unsatisfactory, and since the Franco-Prussian war of 1870-71 have been abandoned in favour of a single-wedge system of great neatness and efficiency. The Armstrong guns were also breech-loaders, and when tested by land and sea, on actual service in China, New Zealand, and Japan, proved to be very powerful when compared with the old smooth-bores, but also exhibited many defects of construction. At this time no thoroughly successful breech-loader had been invented, and England reverted to muzzle-loading, while

FIG. 22.—13-inch Mortar.

and the 16-pounder of 12 cwt., of similar construction, was being brought forward. Against these guns the Prussian 6-cwt. field breech-loader had no chance. Its lightness was almost its only merit. Throwing common shell with percussion fuzes (which were useless on soft ground), having but a poor muzzle velocity, and suffering much from retardation by the air, its effect was feeble compared with that of the British 9-pounders, which threw with 200 f. s. more velocity a time-fuzed shrapnel of excellent construction, while the 16-pounder, though not equally fortunate with the 9-pounder in the arrangement of its projectile, yet by sheer power and weight of metal surpassed in deadly effect every field gun in existence. England's field artillery was undoubtedly the most powerful known at that period. No one was more alive to this fact, or more dissatisfied with

FIG. 23.—10-inch Shell Gun.

it, than the Germans. Their great gunmaker, Krupp, forthwith improved his breech-closing fittings, and instituted series upon series of experiments till he produced two guns—one for horse artillery, and one for field batteries, also horsed—which were an enormous advance on the weapons previously employed against the French. The lighter gun weighs 7 cwt., and throws a shell of 11 lb weight, with a muzzle velocity of 1525 f. s.; the heavier weighs 9 cwt., and throws a shell of 17 lb weight, with a muzzle velocity of 1460 f. s. These are figures indicating power not to be attained by the English 8-cwt. gun, or even the newer pattern of 6 cwt. throwing a 9 lb shell with a muzzle velocity of 1380 f. s., and the 12-cwt. gun, throwing a 16 lb shell with a muzzle velocity of 1360 f. s. The immediate consequence of the introduction of these improved German pieces was

FIG. 24.—Coehorn Howitzer.

the instituting of a series of experiments in England which resulted in the production of a muzzle-loading field gun, weighting 8 cwt., and throwing a 13-lb projectile with a muzzle velocity of 1560 f. s. Shrapnel shell from this gun will retain velocity over 800 f. s. (the speed below which they cease to possess high efficiency) up to 3500 yards range. In this new gun advantage is taken of all the latest improvements, such as an enlarged powder chamber, increased length of bore, polygroove rifling, rotation by gas-check, and powder specially adapted to the piece. Although the introduction of this field gun once more places English light-artillery in the van, further progress is near. Sir W.

G. Armstrong & Co. are now (1879) experimenting with field guns, both muzzle and breech-loading, yielding velocities of 2000 f. s., and no doubt a fresh development of the new principles of air-spacing and chambering (already initiated in the Royal Gun Factories) is at hand (see GUNMAKING).

The history of the progress of siege guns would be in a great measure a repetition of that of the field artillery. Briefly, the smooth-bored siege train of cast-iron 18-pounders and 8-inch howitzers was replaced in 1859-63 by one composed of 20-pounders, 40-pounders (figs. 25-28), and 7-inch rifled breech-loading pieces, with certain howitzers which

FIG. 25.—40-pounder Armstrong Rifled Breech-loader.

never earned adoption. Subsequently the breech-loaders have been gradually ousted by 25-pounder, 40-pounder, and 64-pounder muzzle-loaders, with 8-inch, 6.6-inch, and 6.3-inch howitzers, new patterns of which latter pieces have just passed their early trials. The 64-pounders were introduced in 1864. For naval purposes the calibre was chosen so that

but recently longer and more powerful shell-guns have been tried, throwing heavier projectiles with greater accuracy. In these new pieces polygroove rifling with gas-check rotation affords a hope that the necessary precision may be attained.

FIG. 26.—40-pounder Breech Screw.

32-pounder round shot could be fired from it on emergency. The 40-pounders are stronger, and fire much heavier charges than their breech-loading congeners. The 25-pounder was introduced in 1874 to supersede the 20-pounder breech-loader for light siege trains, and as a gun of position. Ever since 1853 experiments have been carried out by the Eng-

The "converted guns" must not be passed over, since they are largely employed to arm our land fronts and to provide cheap and efficient pieces for practice by the reserve forces. When first elongated rifled projectiles were introduced, a great many methods of strengthening the old cast iron ordnance were proposed. The most satisfactory was that put forward by Palliser, and consisted of lining bored-out cast iron shells with wrought iron tubes. Some of the smaller men-of-war carry these pieces, but the great majority are used only for the secondary purposes above mentioned. The 32-pounders of 58 cwt., and the 8-inch shell-guns of 65 cwt., have thus become 64-pounders, and the 68-pounder of 95 cwt. has become an 80-pounder.

Important as are the land-service pieces of the army to England, yet, viewing her naval supremacy as one of the chief sources of her greatness, we must consider heavy ship and coast-defence ordnance to take the first place in modern gunnery. The contest between guns and armour has now continued with scarcely any intermission for upwards of twenty years, during which time the armour has increased in thickness from 4 to 24 inches, and the guns from 68-pounders to 2000-pounders; that is, from the most powerful of the old cast-iron smooth-bores to the 100-ton gun. The first armour-piercing rifled guns were the 7-inch Armstrong breech-loaders, but their supremacy was of short duration. They were the heaviest made on that system, and were speedily succeeded by far more powerful muzzle-loaders. In 1867 8-inch and 9-inch guns had already been introduced. The 9-inch Woolwich rifled gun of 12 tons was tried in competition with the xv-inch American smooth-bore, which weighed nearly half as much again, against armour. The British piece gained a decisive victory. In 1868 it was decided to introduce a 10-inch gun of the same character. Since that time progress has been continual, and the latest productions of the three great gun-producing establishments of the world are the 71-ton steel breech-loader, recently tested, of the German maker (Krupp), the 80-ton muzzle-loader of Woolwich, and the 100-ton muzzle-loader of the Elswick firm (Sir W. G. Armstrong & Co.).

FIG. 27.—40-pounder Vent Piece.

FIG. 28.—40-pounder Vent Piece (section).

lish and other nations for the improvement of mortars and howitzers, first in a smooth-bored and then in a rifled state. These experiments are still in progress, and it cannot be said that the art of throwing heavy shell at high angles has as yet arrived at perfection. In 1872 short pieces throwing shells of 180 lb and 64 lb were adopted,

Tables IV. and V. show all the principal rifled guns in the land and sea services of Great Britain. It has always been an object with the authorities to assimilate the guns of the two services as far as their respective requirements will permit, and so to avoid multiplication of stores at the numerous home and foreign stations where supplies are made; but still it will be observed that considerable differ-

ences exist, and, judging from the progress of events, it appears likely that these differences will increase, because, as the science of gunnery becomes developed, each new kind of gun is more exactly fitted to the performance of the special work for which it is intended, and therefore less suitable for other purposes.

Table IV. shows five distinct classes of rifled ordnance. 1. The heavy *armour-piercing guns* (figs. 29, 30) are mounted round our coasts in casemates and barbette batteries. Their function is to protect the British shores from the attack of ironclad ships, wooden vessels, and boats. They are accordingly provided with Palliser projectiles, common shells, and

a small proportion of shrapnel shell. In order to strike vessels steaming past at high speed, great accuracy, combined with rapidity of fire, is requisite. The guns are

aimed either by eye or map, according to the nature of the coast. In the former case, the detachment commander estimates the range, gives the necessary elevation by means

FIG. 29.—100-ton Gun (section).

of the tangent sight, directs the line of fire according to his judgment, jumps down and gives the word to fire—allowing for the vessel's motion and the time of the projectile's flight.

The map system has been recently perfected by Captain Watkin, R.A.

In it the whole navigable front commanded by the battery is plotted down in small squares numbered and lettered.

Tables of the distances of the centres of these squares, the degree of training on the traversing arc required to lay the gun on the desired square, together with the actual elevation necessary to deposit the shot in that square, are constructed for each group of guns.

FIG. 30.—100-ton Gun (section of groove).

He telegraphs to the battery orders to load and lay, in accordance with the instructions given for each square of the map, and transmitted to the tell-tales. As the vessel passes over the square for which the guns are laid, the commanding officer can fire electrically the group of guns by pressing a key with his finger, or he may direct each detachment to keep up independent practice, laying in accordance with the indications sent by him through the tell-tale. The arrangements for exploding submarine mines or fixed torpedoes, where hostile vessels are passing close to them, are somewhat of the same character as those above described.

2. The *land-front guns* of fortresses shown in the table are intended to overpower and quell the fire of any pieces which can be brought against them by a besieger. They are very largely supplemented in most fortified places by a number of the old smooth-bored guns and caronades, which are well adapted for the use of case shot at close quarters, for sweeping the glacis, and for the defence of ditches. The rifled guns throw common shell into the siege works, and where possible among the enemy's material. They harass his working parties and reliefs with shrapnel, and endeavour to cut down his parapets and dismount his artillery by direct fire.

3. *Siege-train guns* accompany an army on a campaign where great mobility is not required, and where it is necessary to reduce fortified places. They should be the most powerful pieces which the means of transport will permit. In the more civilized parts of the world, where roads and climate are favourable, it is generally considered that about 70 cwt. is the heaviest weight of piece that can be carried with an army. In less favourable countries it is frequently impossible to transport more than half that weight. The early rifled siege-train guns were grouped into two classes. A unit of the heavy train comprised—

64 prs. of 64 cwt.....	8
40 „ of 35 „	8
.8" howitzers of 46 cwt.	14 (figs. 32, 33)

A unit of the light train comprised—

40 prs. of 35 cwt.....	10
25 „ of 18 „	10
6-3" howitzers of 18 cwt.	10

Lately 8-0" howitzers of 70 cwt. and 6-6" howitzers of 35 cwt. have been introduced, but their allotment has not yet been settled. Siege guns are supplied with special shell

FIG. 31.—Watkin Position-finder.

In fig. 31 F is a fort defending the channel; ABFC the line of shore; O the object to be hit, a vessel passing. A, B, and C are stations of observation. In a convenient spot the commanding officer of the artillery in the fort places the map, over which play two arms A'O, C'O' kept constantly parallel to the two lines of sight AO, CO, by means of mechanism actuated by currents of electricity transmitted by a cable connecting A and A', C and C'. As A'C' represents, on the scale of the map, the distance AC, the junction O' represents on the same scale the position and distance of the object O. Tell-tales are distributed in the casemates, which constantly exhibit the number of the square over which the vessel is passing, showing the position of the ship, so that when the gun, or group of guns, are loaded, they can be either laid in the ordinary way, taking the range from the tables, or, if the object is invisible from the casemate, by trailing the gun round till the number of degrees indicated by the tell-tale agrees with the reading on the traversing arc, and giving elevation to suit the range. The arcs showing the direction of the guns are so arranged that guns

somewhat similar to Palliser projectiles, for penetrating masonry; also with common and shrapnel shell. The howitzers rarely use shrapnel shell. On first attacking a fortress at a long range, the duty of the guns is to cut down the defender's parapets, dismount his artillery, dismantle his ramparts, and subdue his fire, so as to facilitate the con-

FIG. 32.—8-inch Howitzer, 46 cwt. (section).

struction of batteries nearer the place. In the meanwhile the howitzers lob heavy shell into his works, and bombard the town, if necessary. As soon as practicable, breaching batteries are thrown up in such spots as may be found suitable for the attack of a weak point. It is rarely possible to breach by direct fire in the case of works of modern

FIG. 33.—8-inch Howitzer (section of grooves).

design. Here it is that curved fire is so effective, and here it is that the accuracy of rifled howitzers becomes so necessary. In order to make a practicable breach up which an assault can be delivered, the masonry at B (fig. 34), must be cut away, and owing to the height of the cover at A the fire must be curved to reach a point sufficiently low. Direct fire—*tir à plein fouet*, as the French express it—would strike too high up. Sometimes a work is so constructed that it is necessary to strike a point half-way down the masonry revêtement to form a practicable breach. As it is desirable to strike with as much force as possible in breaching, it is evident that where the profile of the work requires the angle of descent of the shell to be considerable, it is necessary

FIG. 34.—Profile of Work.

to select a spot for the battery at the longest range compatible with accuracy. For, given a certain angle of descent, the longer the trajectory (*cet. par.*) terminating in that angle, the greater will be the remaining velocity. Sometimes the guns of the siege train are employed with an army in the field to hold certain valuable ground against attack. They are then called guns of position, and are so placed as to command the approaches most effectively, and yet, if possible, to be dragged away at the last moment in case of retreat. They will usually fire shrapnel shell when thus employed.

4. The all-important qualities of *field guns* (figs. 35, 36, 37) are mobility and shrapnel-throwing power. They must be able to make long marches rapidly, to change position with celerity, to crush troops and the enemy's artillery with

accurate, well-sustained fire at high velocities, and to support rough usage without detriment to their efficiency. They are supplied with shrapnel and common shell, and case shot, of which shrapnel form by far the largest proportion.

5. The *mountain-train guns* are both 7 pounders; they fire the same shell, but the heavier one uses a 12-oz. cartridge while 6 ounces is as much as can be fired from the lighter

FIG. 35.—13-pounder of 8 cwt. (section).

one. Both guns are intended for mule transport, one mule taking the gun, another the carriage, and a third the wheels, &c.; but at the Cape of Good Hope the heavier 7-pounder is mounted on a light high field-carriage for transport as well as for firing, while in Ashantee the lighter 7-pounders were dragged on a kind of sleigh. The lighter gun is tolerably effective for nearly a mile, and the heavier for about a mile and a half. Some jointed guns, proposed by

FIG. 36.—13-pounder of 8 cwt. (front view).

FIG. 37.—13-pounder of 8 cwt. (section of groove).

an artillery officer, are now under trial. They are composed of two pieces screwed together, and, being carried separately, form a gun of about twice the weight of the ordinary mountain gun. Great increase of power is expected from this method of construction. Mountain guns are principally employed to throw time-fuzed shrapnel at troops, and percussion-fuzed common shell into hill works and woods occupied by the enemy.

In Table V. the principal sea-service rifled guns are shown. Three kinds of work are performed by them, viz., to pierce Naval ironclads and armoured forts, to attack unarmoured vessels, and to keep up a fire on troops on shore or on approaching boats. The heavy armour-piercing guns are well provided with common shell, as well as with chilled projectiles, so as to perform the first and second duties, but they have a very small proportion of shrapnel shell, which is intended to be used by them against troops or boats only on emergency. The 7-inch and 64-pounder guns are supposed to be quite sufficient in ordinary cases for the second and third duties, assisted in the third case by the smaller boat guns. All these are well furnished with common shell and shrapnel.

Gun Carriages.—The development which has taken place of late years in the power of artillery has necessitated corresponding changes in gun carriages. Formerly, every carriage was capable of travelling to some extent; even the heaviest guns were mounted on carriages fitted with trucks, which permitted motion on the ramparts or about a deck. Later on, sloping traversing platforms were introduced, upon which the gun carriage recoiled on firing. Extra means of checking recoil became necessary as the power of the guns grew; compressors, or friction plates, were introduced, and are now only partially superseded by the hydraulic buffer. Mobility of carriage has almost entirely been given up, except for field and mountain artillery. The heavier siege guns travel on platform waggons, not on their firing carriages; and it is possible that the traversing platform and slide principle will extend yet further.

Tables IV. and V. show how the various pieces in the British service are mounted. Differences of detail exist, but the general system is the same for all European

countries. Wrought iron is rapidly supplanting wood in the construction of carriages, and there are signs that it will in its turn be in great measure superseded by a mild steel. The subject of gun carriages is too long and too complicated to be treated in detail here, but, as guns are of no use

the tire forms a frustum of a cone, instead of being a cylinder. The object of this form is to obtain lateral strength, especially in travelling on uneven ground. The axletree bed is of wrought iron, constituting, with the axle, a beam of box-girder section, the axletree forming the bottom. The trail consists of two side brackets, fixed by

FIG. 38.—9-pounder Field Gun Carriage (elevation).

without carriages from which to fire them, it is necessary to give some idea of the chief modes of mounting modern artillery. Figs. 38, 39 show the details of the 9-pounder rifled muzzle-loader carriage. It consists of three parts, the wheels, the axle, and the trail. The wheels have oaken

FIG. 40.—9-pounder Limber (elevation).

two transoms, two bolts, and the trail piece carrying the trail eye. The brackets are made of plate iron, riveted to a frame of angle iron. The axle carries two seats for gunners; into the trail are fitted the elevating screw and wheel, and the drag shoe with chain hangs below. Fig. 38 shows the gun and carriage in the firing position; when it is desired to move it to any distance exceeding a

few yards, the point of the trail is raised, the limber is brought up, the trail eye is passed over the limber hook and keyed fast. The gun carriage and limber then form a four-wheeled vehicle, and travel as such. Figs. 40, 41 show the limber, which consists of wheels and axletree similar to

FIG. 42.—9-inch Gun Wrought Iron Carriage and Dwarf Platform.

those of the gun carriage, ammunition boxes, platform, and a pair of shafts. In the British service each gun carriage and limber are drawn by three or four pairs of horses, according to the nature of the piece. The driver of each pair mounts

the near horse; the off wheel horse is between the shafts. In some countries pole draught is preferred.

Fig. 42 shows a 9-inch gun mounted on a wrought iron carriage and dwarf platform. This arrangement may be

considered typical of all sliding carriages on traversing platforms. The direction of the gun is changed as required by training the platform to the right or left, the trucks working on the racers, front and rear, which are usually of wrought iron, laid concentrically on a bed of stone. The level of the traversing platform rises towards the rear, so as to assist in absorbing the work of recoil on firing, and to facilitate running forward again after loading. The recoil is also checked either by a system of friction plates, called a compressor, or by an hydraulic buffer, placed parallel to and between the sides of the traversing platform, so that the carriage on recoil forces a piston into a cylinder containing oil, which escapes, through holes cut through the piston head, into the space round the piston rod; the size of the holes and the amount of the oil regulate the resistance offered to recoil, and enable the gunner to stop the piece at the proper place.

Several kinds of carriages on the "disappearing" principle have from time to time been put forward. In these the gun is exposed to the fire of the enemy only while being aimed and discharged; loading is performed under cover. The Moncrieff carriages are the most successful of this class. In them the force of recoil is stored up and employed to raise the gun from the loading to the firing position. Colonel Moncrieff applies his principle in two ways: the recoil either raises a counter-weight or forces a piston into a cylinder, compressing, by the aid of a fluid, air already much compressed. The counter-weight carriages are used to some extent in coast defence, and the hydro-pneumatic carriages are under trial for siege-train guns. Plate V. gives the details of the former. On a level traversing platform rolls a carriage or "elevator," which places the gun in the required position either for loading or firing. The end of the elevator opposite to that which carries the gun is weighted, so that the recoil causes the elevator to roll to the rear and the gun to descend, at the same time raising the weight, which is retained in the upward position till released after loading, when its descent again raises the gun. Thus the elevator is a lever of the first order working on a shifting fulcrum, the curve (an involute) of the rolling surface being so adjusted that the resistance of the weight gradually increases as the gun recoils, and finally stops it smoothly and without violence. Conversely, by this form the gun is raised to the firing position gradually and without being jolted.

Hydraulic Gear for Guns.—As soon as the weights of ordnance increased so greatly that their service exceeded the power of manual labour, it became necessary to find some substitute. Steam power is always at hand in steam vessels, and it was quickly seen that it was best applied through the medium of water pressure. The simplicity and compactness of hydraulic machinery, the circumstance of its direct action rendering toothed gear unnecessary, and the perfect control it gives over the motion of heavy weights, especially adapt it for the purpose.

Plate VI. represents the mode in which the system is applied to the working of the 80-ton guns on board H.M.S. "Inflexible." A circular turret contains two guns placed side by side, and strictly parallel as to line. The hydraulic pressure is conveyed through the trunk A by pipes to the presses in the turret. At B is a press for elevating the gun; this press also absorbs the force vertically given off during recoil on the elevating beam C. D is the gun-slide which carries the recoil press G for checking the recoil. This press is supplied with a tank T, up into which the water from the press G must escape through valves V loaded to the required pressure by springs. E is the gun run forward in the firing position; its trunnion S is fixed to the end of a piston rod, the head of which enters the press G; when the gun E is fired it recoils into the position F, shown by the dotted outline. The trunnion S forces the piston home into the cylinder G, driving the water up into the tank; the trunnion fittings run along the gun-slide horizontally, and the attachment or saddle below the gun runs up the elevating beam C, which is pivoted at the fixed point T, so as to depress the muzzle outside

the port P of the turret PR. The gun is then in the loading position. In the meanwhile the turret has been caused to revolve on the conical rollers H, H by hydraulic pressure till the muzzle of the gun is brought opposite the loading apparatus, which is securely housed below deck. The water power is taken down the ammunition hoist K, which raises a truck L, carrying a shell, on the top of which is laid a cartridge, to the loading position M. The sponge N, similarly worked by hydraulic pressure, serves as a rammer also. To perform the operation of loading, the sponge is forced home through the bore of the gun against the bottom, by contact with which a button on the head is pressed, setting free a rush of water; this thoroughly and visibly drenches the bore, and prevents the remotest possibility of a burning fragment remaining from the previous round; the sponge is then withdrawn, and the ammunition raised to M; the sponge now becomes a rammer, thrusts the cartridge into the muzzle of the gun, and is drawn back; the truck is raised still higher, the rammer then pushes the projectile into the muzzle, and rams home both cartridge and shell together; a wad previously placed on the head of the rammer is left behind, fast in the bore in front of the projectile, which is thus prevented from moving forward. An indicator on the rammer shows whether the charge is home. The press B is then put in action to lower the breech, raising the muzzle to the elevation required to suit the range of the object to be fired at; the gun is run forward to the firing position E, and the turret is revolved till the guns point at the object. The sighting is not on the guns, but on the turret; the captain of the battery looks through a hole in the roof R, behind the guns, and arrests the movement of the turret at the correct place, when the line between the sights, which is parallel to the axes of the guns, is directed to the object. The firing may be performed either in the usual way, or by electric tubes and wires from a distance.

Plate V., fig. 2, shows a 100-ton rifled muzzle-loading gun, mounted *en barbette* for coast defence, and adjusted for hydraulic loading. After being fired the gun is traversed round to the position A, where its muzzle is brought opposite the loading apparatus G, which is contained in a recess in the parapet D. An hydraulic hoist E raises the ammunition on a truck F to the muzzle; a similar apparatus is constructed on the right of the gun, which is traversed to either at pleasure. The carriage B slides on the platform C, which pivots on P, a trunk through which is introduced the hydraulic power for running the gun back and absorbing the recoil.

Many other applications of hydraulic power to gunnery besides those just described are due to Mr G. Rendel of the great Elswick firm. One of the most novel is that adopted in H.M.S. "Téméraire," in which 25-ton guns are mounted on the disappearing principle in a turret having no roof and no ports; inside the turret is a turn-table carrying the gun by the trunnions on two arms, which are raised by hydraulic power, enabling the gun to fire *en barbette* over the wall of the turret. The recoil brings it down again, and it is placed opposite the loading gear by revolving the turn-table. The general principles are the same as those on which the previously described systems are constructed.

Loading.—This article would be scarcely complete without a reference to the comparative advantages of the muzzle and breech-loading systems. Many have been much impressed with the great superiority of breech-loaders as small arms, whether for sporting or military purposes, and have concluded that the same superiority must extend to ordnance constructed on this plan. Others, having seen the difficulty of avoiding complication and accident to the parts in the early breech-loaders, have hastily condemned the whole system. The truth, as is often the case, lies between the two views, as will be seen from the following considerations. The chief points of excellence to be attained by a field gun are—(a) high ratio of power to weight; (b) immunity from injury by its own fire; (c) immunity from injury by the enemy's fire; (d) capability of supporting the accidents of service; (e) rapidity and facility of manipulation; (f) efficiency of projectile. (a.) The power of a gun is most conveniently measured by the energy (in foot tons) communicated to the projectile on leaving the muzzle. The following table shows how the latest English and German field guns compare together in this respect. The English guns are muzzle-loaders, the German ones breech-

The English 9 and 16-pounders at the time of their introduction were the most powerful field guns known, but were after a time beaten by the new German guns, which will in their turn be beaten by the new English piece, the first supply of which was lately issued. Recently a trial was carried out of two field guns made by Sir W. Armstrong & Co. They were precisely similar in all respects, except that one was a breech-, the other a muzzle-loader. No difference in their excellence could be detected. Thus it may be considered as certain that the power of a gun is in no way affected by the mere fact of its being a muzzle-loader or a breech-loader. Should, however, the adoption of one system favour an improved construction, or lend itself more readily than the other to the use of improved ammunition, this equality would disappear, and whichever system should gain a decided advantage in power, which cannot be obtained by its rival, must certainly prevail. It is almost impossible to overrate the importance of high velocity, combined, of course, with efficiency of projectile. In the field it enables the gunner to place the enemy under fire at long ranges, and so to force him to change his formations, and show his hand. It intensifies both the moral and physical effect of shell upon troops. It permits the guns to occupy good positions without the necessity of constant moving to get within range. In entrenchment firing it is, if possible, of still greater importance. Low velocity projectiles fired from field guns are almost harmless against earthworks. They have not sufficient bursting charge to do damage to the work by mere explosion, nor impetus enough to cut down the parapets; while the defenders hear the gun and crouch under cover as the shell comes. Thus it is not surprising that all our recent advances have been towards high velocities. Nothing has tended more to this end than the enlargement of the diameter of the powder chamber, which facilitates the profitable consumption of increased charges. This improvement is found to act differently on the two systems of loading. A chambered muzzle-loader requires an expanding cartridge (in field guns); a chambered breech-loader requires a breech-closing apparatus of increased size and weight. Supposing a satisfactory expanding cartridge to be devised, the muzzle-loader gains in ratio of power to weight. If this be found impracticable, the breech-loader secures an important advantage in this respect. Experiments are still in progress, and it would be premature to pronounce definitely in favour of either at present, especially as some fresh discovery or new explosive may at any moment confer preponderance on either system. (b.) In the Franco-German War of 1870, a large number of old pattern double-wedge breech-loaders became unserviceable by their own fire. This difficulty appears to have been quite overcome in the newer patterns of Krupp field guns by the adoption of the cilindro-prismatic wedge, with Broadwell ring and steel facing-plate. It would probably be incorrect to affirm that a breech-loader has quite as great immunity from injury by its own fire as a muzzle-loader, since no joint, however well contrived, can be as strong as the solid-ended steel tube forming the breech of the latter. But, putting mathematical certainty of security out of the question, it may now be accepted that practically field guns can be made as

safe and endaring on one system as on the other. (c.) As regards immunity from injury by the enemy's fire, the muzzle-loader has a decided advantage. It is difficult to estimate the real value of this advantage, depending as it does partly on the manner in which artillery is employed, and partly on the doctrine of chances. During the Russo-Turkish War of 1877-78 but few guns were placed *hors de combat* by the enemy's fire. In such cases as did occur, the injuries were nearly always such as would not have effected muzzle-loaders. The wedge handles were usually bent up by the action of percussion fuze shell jamming the wedges. The Russian field guns were generally of a feeble class; the proportion of entrenchment fighting was unusually large; and in the field the Turkish artillery habitually fired at long ranges. It may therefore be fairly concluded that the number of guns injured by the enemy's fire was not so great as to render the superior invulnerability of muzzle-loaders of much importance. These conditions will probably be reversed in any great war in which England may take part; and hence the advantage gained by muzzle-loaders in immunity from damage by hostile fire must be carefully borne in mind in comparing the two systems of loading. (d.) In capability of supporting the accidents of service, there is not much to choose between the two rivals. The breech-loader is more liable to injury from being upset, and exposes more parts and finer fittings to the action of the weather. On the other hand, it is easier to clean, and the officer can better see that it is clean. The jamming of projectiles in the bore when ramming home, which sometimes occurs with muzzle-loaders, is impossible with breech-loaders. This defect, it is hoped, has been overcome in the new English field gun. The preservation of breech-loaders, especially in mountainous countries, necessitates a profuse expenditure of oil and grease. (e.) In comparing the rapidity and facility of manipulation of the two methods of loading, it is necessary to consider the circumstances under which the guns are employed. Suppose a horsed battery of guns to gallop to an open spot whence they command a body of hostile troops in motion. Coming into action, the gunners load and fire as rapidly as accuracy will permit, unhampered by parapets. It is evidently of great importance to throw as many projectiles as possible among the enemy. Here the muzzle-loader will have some advantage. With full detachments in the open it takes rather less time to load, aim, and fire a muzzle-loading field gun than a breech-loading one. The reason of this is that with the former the man laying the piece can manipulate the sight and usually take aim while the loading is being performed, while, when the projectile and cartridge are thrust in from behind, he has to wait till the loading is done before he can get to the sight. There is no practical difference in the time occupied by the actual loading. In one case, the cartridge and shell are rammed down a long distance together; in the other, first the shell is put in a short distance, and afterwards the cartridge, and the wedge has also to be withdrawn and replaced. Next, suppose a commanding position to have been selected for a battery, and a light entrenchment to have been thrown up, over which the guns fire. Here the muzzle-loader will lose the advantage gained when firing in the open, as it must be loaded before being run up to the parapet, and aimed afterwards. Both natures of gun recoil, and it makes no difference in time whether the ammunition be thrust home when the gun is back at the recoil position, or after it is run up. Here the breech-loader and the muzzle-loader stand upon equal terms. Thirdly, suppose—a rare case with field guns—that firing with reduced charges is required, that shell are being lobbed from behind a parapet at high angles into a work. Here we shall have little recoil, probably not enough to permit loading at the muzzle without the gun

being run back by hand. Loading at the breech will, however, be perfectly simple. In this case the breech-loader gains a very decided advantage over the muzzle-loader, since not only does it not require to be run back, but it has to be run up merely a very short distance. To this the advocate of muzzle-loading will probably reply that shells are lobbed with low velocities into works only at considerable intervals of time, that rapidity is therefore of no use, and that the advantage claimed is worthless. No doubt there is truth in this argument, but suppose the action of reduced charges on the gun to be imitated by the introduction of a brake which shall check the recoil within a short space, even when the gun is firing rapidly with high velocity, then the breech-loader behind entrenchments gains a distinct advantage. The German guns are supplied with powerful but clumsy brakes, more for travelling purposes than for firing, and it is doubtful how far they answer for the latter object. In the British service it has not been thought important to check recoil, since a certain amount of it has been necessary for loading behind parapets; but trials have been made of brakes, &c., for the purpose of preventing guns from running backwards down a reverse slope when fired from the crest of a hill, or, more generally, for checking excessive recoil. Up to the present time (1879) no great success has attended these efforts, nor does it appear feasible to abolish recoil altogether by sinking the wheels in a ditch, since the strain on the carriage would then be much increased. There is no doubt the question offers grave difficulties, especially as lightness is such an important feature in the construction of field gun carriages. As yet, then, the reduction or checking of recoil behind a parapet confers but a problematical superiority on breech-loaders, and cannot be held to counterbalance the advantage gained by muzzle-loaders in the open. (f.) In the older pattern guns of both systems, where studs and windage were pitted against lead coating and no windage, the muzzle-loading projectile was able to take a better time-fuze than could be used in the breech-loader, but it did not possess the same accuracy of shooting. Since the introduction of the poly-groove system, in which rotation is given and windage sealed by a copper-flanged ring or disc at the base of the shell, the muzzle-loading projectile has lost the advantage of being able to use the simpler time-fuze, but has gained in several important respects. The breech-loading shell has also been improved by the substitution of two copper wires for the lead coating, but is probably inferior to the new muzzle-loading projectile, which, however, can be used equally well for breech-loaders. It may be said therefore that the systems are equal in respect to efficiency of projectile.

Thus then, taking the six qualities named as chief excellences to be sought for in field artillery, it appears that in four of them there is practically little or no advantage gained by either system over the other, while, in the two remaining qualities, the muzzle-loader has slightly the best of it. On the whole it seems therefore that, at the present moment, the balance of evidence is in favour of muzzle-loading for field guns.

In comparing the advantages of the rival methods of loading siege guns, the entirely different character of the two classes of pieces composing a train at once forces itself on the attention. One class consists of long guns, projecting far over a parapet, and usually fired at low elevations with heavy charges; the other of short guns, usually fired at high elevations with low charges, the muzzles on recoil coming well within the emplacement. The Germans use long and short 15-centimetre guns, both breech-loaders, and both throwing shell of the same weight. The long gun, fired with heavy charges, weighs three times as much as the short gun, which is fired with light charges. Supposing

the dimensions of the short gun were increased, the proportions remaining unchanged, till its weight equalled that of the long gun, then it would be able to fire shell of three times the weight. This is what is actually being done in the British service. Now all these heavy pieces, firing either heavy powder charges or heavy shell, require very strong and consequently very heavy carriages to bear the recoil, and it is found convenient to transport the guns on comparatively light platform waggons apart from their firing carriages. Hence there is no longer any necessity for constructing firing carriages with a view to travelling purposes; and it is probable that traversing slides will be introduced for all heavy siege pieces. It is not requisite to institute at length a comparison of the various qualities desired for siege guns. Rapidity is very rarely of importance with them; they are always fired under cover, and it may be at once assumed that, as far as power and endurance go, the two systems are practically equal. A fresh set of conditions comes into play: the projectiles are heavy; and convenience of loading, combined with safety to the gunners from the enemy's fire, should now be considered. As these points are connected with the form of carriage employed, it was necessary to call to mind in comparing breech with muzzle loading, that slides are likely to take the place of travelling carriages. When long guns are fired, in order to permit loading at the muzzle, it is requisite that the recoil should be great, and the emplacement deep. Many devices, such as flexible rope rammers, jointed staves, &c., have been tried, but have not proved perfectly successful in overcoming this difficulty. Breech-loading here has a considerable advantage. Long guns are fired at low angles of elevation, and no difficulty therefore is experienced in thrusting the projectile home from behind in a nearly horizontal bore. High velocity is required, and the breech-loading system lends itself readily to enlargement of the powder chamber, without necessitating the complications of an expanding cartridge. If slides are used the hydraulic buffer checks the recoil at once; on the other hand, the parapet affords rather better protection to men standing close to it at the muzzle than to men standing a little way off at the breech. These conditions are reversed with the short pieces. The rammer is short, and no great recoil is necessary to permit loading at the muzzle. The elevation is high, and it is much easier to drop a shell in from the front than to thrust it up from behind. Indeed this cannot usually be done, and a breech-loader has to be brought nearly horizontal for loading. High velocity is never required, and enlargement of powder chamber is not wanted. The men are in the most sheltered position at the muzzle. If these views be admitted as correct, it seems clear that the long pieces of a siege train should be breech-loaders, and the short ones muzzle-loaders. To this it may be objected that uniformity would be sacrificed by such a combination. There is not much in this objection. The mere fact of two guns being loaded in different ways is surely of little consequence, and can easily be grasped by the dullest gunner. It is done every practice day on board ship, where the old pattern Armstrong vent-piece breech-loaders are combined with modern muzzle-loaders. As regards the stores, a long and a short gun of the same weight would not under any circumstances fire the same ammunition, and even in cases where a heavy long gun is associated with a light short one having the same diameter of bore, as in the case of the German 15-centimetre pieces, there is no reason why the same projectile should not be used for both if desired; that is, the new smooth muzzle-loading shell, with a gas-check on the base, would answer for both.

The question of breech-loading or muzzle-loading is obviously not only complicated, but is liable to alteration in its conditions with every advance made in the science of

gunnery. To decide that an army or a navy should have nothing but breech-loaders, or nothing but muzzle loaders, would be to make a fetish of uniformity; there is plenty of room for both systems. With regard to heavy fortress and ship guns, it is easy to suggest positions where it will probably be found that one system has a decided advantage over the other. Thus, taking the sea service first, in turrets the muzzle-loader is preferable. The loading can be performed with great facility outside the ports, and a turret of a given diameter will house a pair of bigger guns than when the loading has to be done inside at the breech, unless some method of exterior loading can be devised for the breech-loaders also. For broadside guns, on the other hand, it seems equally clear that breech-loading has the advantage, as muzzle-loaders have to be run in so far to permit loading that they must be too short for ballistic excellence. For a small gun placed on a slide in the bow of a boat, it appears far more convenient to load at the breech. For those gunboats in which the vessel is simply the gun-carriage and the line of fire is given by the helm, loading at the muzzle from below deck offers great advantages. Land service heavy guns, mounted on sea fronts for the protection of harbours, &c., present a great variety of conditions. In some cases the rocks or ground on which the battery is erected have such a form that a heavy gun loaded at the breech could be used where only a comparatively small one could be loaded at the muzzle. Sometimes a turret can be erected with loading gear outside, and then the conditions are reversed. In the case of very heavy guns, which once *in situ* are not intended ever to be moved, the argument from uniformity loses much of its cogency; and the circumstances of every gun position could therefore be separately considered. The guns and howitzers arming land fronts of fortresses should follow the same rule as given for the siege train, the conditions of service in battery being very similar. The long pieces should be breech-loaders, the short ones muzzle-loaders. Wherever the com-

parative advantages of breech-loading and muzzle-loading are nearly equal, the decision should be in favour of the muzzle-loaders as possessing the inherent advantages of simplicity, solidity, and cheapness.

Conclusion.—The science of gunnery has received so many developments of late years, and is even now progressing so rapidly, that it is impossible to do justice to the subject within the limits of an article. The reader who wishes for more minute details, and who would study any part of the science thoroughly, is recommended to consult the following list of works:—

GUNNY. This name is applied to cloth or bags made of jute, and is supposed to be derived from *ganga* or *gania* of Rumphius, or from *gonia*, a vernacular name of the *Crotalaria juncea*—a plant common in Madras. One of the first notices of the term itself is to be found in Knox's *Ceylon*, in which he says: "The filaments at the bottom of the stem [scir from the cocoa-nut husk (*Cocos nucifera*)] may be made into a coarse cloth called gunny, which is used for bags and similar purposes." **JUTE** (*q.v.*) is the fibre of two species of *Corchorus*, *C. capsularis* and *C. olitorius*, one species of which, probably the latter, has long been known as the Jew's mallow, from the fact that the leaves have long been used in Palestine, Egypt, and Arabia as a potherb.

The seeds of the jute plant are sown in April or May and the plant is cut down close to the roots just before flowering. The tops are then clipped off and the stems made into bundles, which are placed in tanks or ditches and covered with turf or other heavy substance to keep the bundles under water. Here they are watched anxiously day by day till the fibre separates easily from the central woody portion. The period of retching or soaking takes from eight to ten days; if allowed to remain too long, the fibre rapidly decays. In drying also the fibre generally becomes of a deeper colour. When the fibre is ready for manipulation, the operator descends into the tank or ditch, and taking 10 to 15 bundles, strips off the barkly fibre and washes thoroughly, and by a dexterous movement of the wrist spreads and separates the fibres over the surface of the water. The fibre soon becomes clean, and is hung over

bamboo framework to dry. The fibre thus obtained is fine, long, and silky, but the short staple and the portion near the root held in the hand of the operator during washing, which frequently has bark attached, are the portions generally selected to make gunny bags or cloth of.

The kind of cloth known as gunny, (tat, choti, &c., is woven in various lengths and widths for use as bedding, bags, &c., and formerly, more than at present, every man, woman, and child, boatmen, husbandmen, and others, in their spare moments, distaff in hand, wove gunny cloth. Even the Hindu widow, saved from death and despised by all, made her life less miserable by making gunny cloth, and thus rendering herself to an extent independent of her family. On the eastern frontier women are clothed in it, and the poor cover themselves with it at night. In the Malayan Archipelago it is no unusual sight to see a poor Chinese coolie with a dress made of gunny cloth. The great and most important use, however, to which gunny cloth is applied is in making bags wherein to pack rice, linseed, sugar, cotton, and other products for shipment.

As soon as this cheap, strong, and serviceable material became known, the manufacture speedily assumed enormous proportions, and vast quantities of jute were imported into Dundee for the manufacture of gunny bags and cloth alone. The Dundee mills, in the early period of this trade, had only Indian hand-woven gunnies to compete with. The introduction of the latest machinery of the most approved patterns into Bengal, the chief seat of this industry in India, has, however, had the effect of giving India the opportunity of competing with the Dundee mills on advan-

tageous terms, and now India supplies vast quantities of gunnies to Europe, Egypt, Ceylon, the Malayan Archipelago, China, and the United States. In America alone it is computed that the annual average outturn of cotton is 3,500,000 bales, each bale requiring 6 yards of wrapping material, and of this one-third at least is supplied in gunny cloth. In 1872-73 6,105,275 gunnies and 64,347 pieces were exported from India, whilst in 1876-77, during a period of eleven months, 30,110,616 gunny bags and 5,262,835 yards of gunny cloth were exported to foreign countries. These figures do not include what is sent coastwise or what is used for packing exported Indian produce.

Bombay too has machinery for weaving jute, but has not as yet done much to compete with Bengal, and indeed there appears little hope for Bombay unless large quantities of jute can be made to grow on the spot, since, apart from the cost of carriage, the juices in the jute plant, as in many other plants, become resinified by drying, and therefore require operating upon whilst perfectly fresh, being attended after treatment with more difficulty in manipulation and a less outturn of fibre.

The excellent gunny bags sent to England are often used for repacking for exportation, and large quantities find their way to paper mills.

G U N P O W D E R

UPON the great importance of the invention of gunpowder it is needless to dwell. Not only has it revolutionized the art of war, and given the forces of civilization a vast advantage over mere numbers and savage valour, but we may even urge, paradoxical though it appears, that the very improvements by which modern science has rendered military machines more deadly tend to make war far more expensive, and therefore to prevent its being so frequently or so rashly undertaken as of old. Besides such indirect services to civilization, gunpowder has been and is of great use in the arts of peace, although of late years to a certain extent superseded by more potent explosive agents.

Such being the case, it is not a little remarkable that the discovery of gunpowder should be veiled in uncertainty, although this very obscurity seems proof of its great antiquity. It is, however, certain that it was *not* invented, as has been often stated, by the German monk Bertholdus Schwartz, about 1320, although Wilkinson, in his *Engines of War*, considers Schwartz may have suggested the use of a mortar, since the form as also the name of this piece of ordnance may well have been due to some accident in the laboratory. Roger Bacon, who was born in 1214, refers, *circa* 1267, to an explosive mixture of the nature of gunpowder as known before his time, as being employed for purposes of diversion, and as producing a noise like thunder, and flashes like lightning; he even suggests its application to military purposes, and indulges in the supposition that some such composition might have been employed by Gideon to destroy the Midianites (Judges vii.). He elsewhere writes—"Ex hoc ludicro puerili quod fit in multis mundi partibus, scilicet, ut instrumento facto ad quantitatem pollicis humani, ex hoc violentia salis, qui salpetræ vocatur, tam horribilia sonus nascitur in ruptura tam modicæ pergamænæ, quod fortis tonitru rugitum et coruscationem maximam sui luminis jubar excedit" (see preface to Jebb's edition of Bacon's *Opus Majus*). In the above passage saltpetre is alone referred to as the violently explosive substance, but Bacon was well aware of the fact that saltpetre of itself will not *explode*, for in his previously written treatise, *De Secretis Operibus Artis et Naturæ et de Nullitate Magiæ*, he says "that from saltpetre and other ingredients we are able to make a fire that shall burn at any distance we please." In chap. xi. of the same work these other ingredients are veiled in the disguise of an anagram: "Sed tamen salis petræ lura nope cum vbre et sulphuris, et sic facies tonitruum et coruscationem, si scias artificium;" the unmeaning words in italics have been translated as *carbonum pulvere*. Robins, in his work on gunnery (1742), and Dutens (*Enquiry into the Origin of Discoveries attributed to the Moderns*) suggest that Bacon may have derived his knowledge from the MS. of Marcus Græcus, preserved in the National Library in Paris, entitled "Incipit Liber Ignium a Marco Græco prescriptus, cujus virtus et efficacia est ad

comburendum hostes, tam in mari quam in terra." Marcus Græcus, who lived about the end of the 8th century, was therefore not ignorant of the military uses to which the composition might be put; among other modes of launching fire upon an enemy he gives one to the following effect:—one pound of live sulphur, two of charcoal of willow, and six of saltpetre, reduced to a fine powder in a marble mortar and mixed together; a certain quantity is to be put into a long, narrow, and well compacted cover, and then discharged into the air. This is evidently the description of a rocket. It has also been suggested that Bacon may have learnt the secret in Spain, in which country he is known to have travelled, and whose Moorish masters were then far in advance of the rest of Europe in science and literature. Albertus Magnus, in his treatise *De Mirabilibus Mundi*, repeats almost word for word several receipts in the work of Marcus Græcus; also, an epistle by Ferrarius, a Spanish monk, and a contemporary of Bacon, which is preserved in the Bodleian Library at Oxford, gives receipts for Greek fire, rockets, and "thunder." There is a treatise on gunpowder in the library of the Escorial, written about 1250, which appears to describe both rockets and shells. The Arabians are, from this and other authorities, supposed to have enclosed combustible or explosive compositions in hollow globes of iron, which were discharged upon the foe either by hand, like the modern grenade, or from the warlike machines then in use; it has also been stated that towards the close of the 13th century they projected small balls from tubes carried in the hand, or attached to the end of a lance, and only used at close quarters, being in fact hand-guns. Rockets were employed during the reign of the Greek emperor Leo, about 880, and indeed seem to have been known in India from time immemorial, some of them having been made of great size.

The gloom of the dark ages precludes further attempt to trace back the history of gunpowder with any certainty, but Mr Dutens, in the work before quoted, adduces many passages from classical authors in support of his view that a composition of the nature of gunpowder was not unknown to the ancients, as, for example, the story of Salmonens, king of Elis, who, according to Virgil (*Æneid*, vi. 585), for his audacity in attempting to imitate thunder and lightning, was slain by Jupiter; Mr Dutens considers he may have fallen a victim to his own experiments. Eustathius, a commentator on Homer, speaks of him as being so skilled in mechanics that he constructed machines to imitate thunder (Eustathius ad *Odys.*, λ 234, p. 1682, l. 1; see also Hyginus, *Fabul.*, 61, 650; Valerius Flaccus, lib. i. 662). It is also narrated of Caligula by Dion Cassius (*Hist. Rom.*, "Caligula," p. 662) that he had machines which imitated thunder and lightning, and emitted stones. See also Johannes Antiochinus, *Chronica apud Peiresciana Falesii*, Paris, 1604, p. 804.

According to Themistius (*Orat.*, xxvii. p. 337) the Brahmins had similar machines. Philostratus, in his life of Apollonius Tyanæus (lib. ii. cap. 14), written about 200 A.D., relates of a people of India, dwelling between the Hyphasis and the Ganges, whose country Alexander never entered: "Their cities he could never have taken, though he had led a thousand as brave as Achilles, or three thousand such as Ajax, to the assault; for they come not out to the field to fight those who attack them, but these holy men, beloved by the gods, overthrow their enemies with tempests and thunderbolts shot from their walls."

From the mention by Vitruvius, and in Plutarch's life of Marcellus, that one of his machines threw large stones with great noise, it has been thought that Archimedes used some explosive composition in the defence of Syracuse.

The most ancient reference of all is in the Gentoo code of laws (Hallid's translation), supposed by some authorities to be coeval with Moses. It runs thus: "The magistrate shall not make war with any deceitful machine, or with poisoned weapons, or with cannon and guns, or any kind of firearms." The translator remarks that this passage may "serve to renew the suspicion, long since deemed absurd, that Alexander the Great did absolutely meet with some weapons of that kind in India, as a passage from Quintus Curtius seems to ascertain." The word translated firearms is literally a weapon of fire, and one species of it has been described as a dart or arrow tipped with fire and discharged from a bamboo, so that the reference may not be to any propelling agent, but merely to some combustible or incendiary composition, of the nature of the so-called Greek fire.

It is almost certain that those authors who assert that the Arabians used gunpowder at the siege of Mecca, 690 A.D., having derived their knowledge of it from India or China, confound gunpowder with this Greek fire, which seems to have been the generic name given to several different combustible mixtures, although Arabian writers speak of them as Chinese fires. Greek fire was introduced into Constantinople from the East about the year 673; it was discharged upon the enemy by means of various engines of war, or in smaller quantities attached to arrows or darts. The Saracens used it against the Crusaders. Maimbourg, in his *History of the Crusades*, describes its effects; and Joinville, who was an eye-witness, says "it was thrown from a petrary, and came forward as large as a barrel of verjuice, with a tail of fire as big as a great sword, making a noise like thunder, and seeming like a dragon flying in the air; the light it gave out from the great quantity of fire rendered the camp as bright as day, and such was the terror it occasioned among the commanders in the army of St Louis that Gautier de Cariel, an experienced and valiant knight, advised that, as often as it was thrown, they should prostrate themselves upon their elbows and knees, and beseech the Lord to deliver them from that danger against which he alone could protect them." However, its actual destructive effect seems to have been very inadequate to the terror it occasioned. From the account of Geoffrey de Vinsauf, sand and earth, but especially vinegar, appear to have been considered the best extinguishers; water would not put it out. One description of this wildfire was composed of resin, sulphur, naphtha, and probably saltpetre. Bacon states that religious scruples hindered European nations from adopting Greek fire; but if so, they seem to have been gradually overcome, for its use is mentioned by various writers, Anna Comnena, Père Daniel, and Froissart among them. Similar scruples no doubt considerably retarded the introduction of gunpowder; and the fear that its adoption would prove fatal to all knightly gallantry also caused it to be regarded with aversion. Firdousi, the famous Persian poet, describes in

his writings what were doubtless the effects of rockets and wildfire discharged upon the enemy, but he ascribes the whole to magic.

The researches of all authorities seem to point to the Far East as the birthplace of an explosive mixture of the nature of gunpowder; it was used there from time immemorial, although doubtless its application as a propelling agent is of far later date. In all probability, the germ of the science of explosives lay in the accidental discovery of the peculiar properties of the nitre so plentifully found mixed with the soil upon the vast plains of India and China. By means of the charred embers of wood-fires, used for cooking, the two most active ingredients of gunpowder might easily be brought into contact, and, under the action of heat, more or less deflagration would ensue; in fact, the accidental dropping of some of the crude saltpetre into the coals would show its remarkable power of supporting and accelerating combustion. The combination of saltpetre and charcoal in a more or less powerful mixture can therefore be easily conceived, the sulphur being an after addition, and not necessary to cause explosion. Our present gunpowder is only the improvement and perfection of such a mixture. Saltpetre was early known as "Chinese snow," and some have supposed the use of gunpowder in cannon to have been known in China very soon after, if not before, the Christian era. But this seems to be an error, for Colonel Anderson, C.B., in his book on gunpowder (London, 1862), quotes a conversation held by John Bell of Antermony, who visited Peking in 1721, with the emperor's general of artillery, to the effect that from their records it had been used in fireworks, &c., for about 2000 years, but that its application to the propulsion of shot was a late introduction. Some of their compositions had such names as "devouring fire," "earth thunder," &c. The *Institutes of Timur*, written about the middle of the 14th century, contain no mention of cannon or gunpowder, although full particulars are given of the equipment of his troops; it is, however, related that when Timur engaged the army of Mahmud under the walls of Delhi, men scattered wildfire and flung rockets in every direction. In this connexion it may be noted that, while the use of rockets was of very old date in India, the names given to pieces of artillery under the rule of Baber and the Mogul conquerors of Hindustan almost invariably point to a European, or at least to a Turkish origin. It is also well authenticated that Akbar and Aurungzebe had Englishmen and other Europeans in their service to teach the art of gunnery. The analysis of the gunpowder made by the Chinese in the present day shows a composition almost identical with that employed in Europe, which has only been arrived at after centuries of experience, so that, in all probability, they have corrected their earlier formula from Western sources.

Whatever obscurity may hang over the early history of gunpowder, it seems most probable that its employment as a propelling agent originated among the Moors or Saracens,—whose civilization for several centuries contrasted forcibly with the intellectual darkness of Christendom,—and from them spread eastward, as well as northward into Europe. Condé (*Hist. Dom. Arabs in Spain*) states that Ismail Ben Feraz, king of Grenada, who in 1325 besieged Baza, had among his machines "some that cast globes of fire with resounding thunders and lightnings resembling those of the resistless tempest; all these missiles caused fearful injuries to the walls and towers of the city." The first reliable contemporary document relative to the use of gunpowder in Europe, a document still in existence, bears date 11th February 1326; it gives authority to the priors, the gonfalonier, and council of twelve of Florence to appoint persons to superintend the manufacture of cannons

of brass, and iron balls, for the defence of the commune, camps, and territory of the republic.

If the testimony of John Barbour, archdeacon of Aberdeen, who wrote in 1375, is to be believed, cannon, which he calls "crakys of war," were employed during the invasion of Scotland by Edward III. in 1327; but they are not mentioned in the accounts of the expenses of this war preserved in the record office. An indenture, first published by Sir N. H. Nicolas in his *Hist. Royal Navy* (London, 1847), and since by Lieut.-Colonel H. Brackenbury (*Proceedings R. A. Institution*, 1865), stated to be of 12 Edward III., 1338, contains several references to small cannon as among the stores of the tower, and also mentions "un petit barrell de gonpouder le quart'plein." If authentic, this is certainly the first distinct mention of gunpowder in Great Britain we now possess, but doubts have since been thrown upon the date of this MS. It, however, seems certain, from a contemporary document in the National Library in Paris, that, in this same year 1338, there existed in the marine arsenal at Rouen, an iron weapon, called "pot de fer," for propelling bolts, together with some saltpetre and sulphur to make powder for the same; at this period the ingredients were usually kept separate, and mixed when required. From the year 1345, 19 Edward III., we have, preserved in the Record Office, reliable accounts of the purchase of ingredients needed for the fabrication of gunpowder, and of the shipping of cannon for France. In 1346 Edward III. ordered all the saltpetre and sulphur that could be found to be bought up for him, but the quantities obtained were very small. Whether it be true or not that cannon were used by the English at Crécy in that year belongs rather to the question of the employment of artillery in the field; it has been maintained that such was the case by Napoleon III. (*Études sur le passé et l'avenir de l'Artillerie*). It may be noted that Petrarch, about the year 1344, in his dialogues *De remediis utriusque fortuna*, speaks of "brazen globes cast forth by the force of flame with a horrible sound of thunder" as having become as common as any other kind of weapon.

In the year 1377, being the first of Richard II., Thomas Norbury was ordered to buy, amongst other munitions, sulphur, saltpetre, and charcoal to be sent to the castle of Brest. In 1414 Henry V. ordered that no gunpowder should be taken out of the kingdom without special licence; in the same year this monarch also ordered twenty pipes of powder made of willow charcoal, and various other articles for the use of the guns.

It was not, however, until the reign of Elizabeth that the manufacture of gunpowder can be said to have been established in England. The greater portion required had been previously imported from abroad, and the trade had been an open one; but the threatening attitude of Spain compelled the Government to provide more efficient means of defence, and patents were issued by the crown for the manufacture of gunpowder, constituting it a monopoly. Early in this reign also, saltpetre began to be artificially produced in England, but the quantity so obtained formed a very small proportion of the supply needed, the remainder being brought from various parts of the Continent, and from Barbary. Again, in 1623, nominally in order to prevent the sale of weak or defective powder, a proclamation was issued by James I., prohibiting its manufacture, as well as that of saltpetre, except under the king's commission, and directing that all gunpowder should be proved and marked by the sworn proof-master. A little later, in 1626, the East India Company had commenced the importation of saltpetre, and had also erected powder works in Surrey. Their renewed charter in 1693 contained a clause providing that 500 tons of saltpetre were to be furnished to the ordnance annually, and from this time forward we hear of

no difficulty, at least in England, of obtaining the chief ingredient of gunpowder, although on the Continent great attention has been paid to its artificial production; this was especially the case in France during the reign of Napoleon I., when the supremacy of Great Britain at sea for many years prevented the importation of saltpetre by her enemies.

About the year 1590, George Evelyn, grandfather of the celebrated John Evelyn of Wooton, received the royal licence to set up powder mills at Long Ditton and Godstone; the Evelyns are said to have brought the art from Holland. The works at Faversham, afterwards for so many years the Government gunpowder factory, date from Elizabeth's reign, but were then of secondary importance to those at Godstone. There seems reason, however, to suppose that powder mills existed at Waltham Abbey so far back as 1561, for in that year we find John Thomworth of Waltham in treaty, on behalf of Queen Elizabeth, for the purchase of saltpetre, sulphur, and staves for barrels. Fuller also refers (*English Worthies*, i. 338) to the powder mills at Waltham Abbey, of which place he was appointed vicar in 1641. In 1787 they were sold to the crown by John Walton, and reorganized under the superintendence of the famous Sir William Congreve. The old royal factory at Faversham was given up after the peace of 1815, being first let and afterwards sold to the well-known firm of Messrs John Hall & Son; a third Government factory at Ballincollig was disposed of a few years later. The Waltham Abbey works have been greatly enlarged of recent years, and no expense has been spared to render them, by the introduction of new and improved machinery, the most complete as well as the safest in the world. It is impossible to describe in detail the various improvements which have been made in the manufacture of gunpowder, but the most important will be briefly stated when describing the successive processes to which the ingredients are subjected.

THE INGREDIENTS AND THEIR ACTION.

The objects to be attained in the production of an explosive agent for artillery and small arms are—(a) the maximum of propelling force; (b) the minimum of initial pressure in the bore of gun; (c) uniformity of action; (d) freedom from fouling, especially in small-arm powders; (e) durability, i.e., power to bear transport and keep well in store. Of all explosive substances at present known, gunpowder alone can be said to fulfil the first three conditions. Its advantages may be summed up as follows:—(a) the rate of combustion of gunpowder is gradual compared with that of most other explosives; and, both by adjusting the proportions of the ingredients and varying the mechanical processes of manufacture, its explosiveness can be modified so as to suit every description of weapon; (b) the ingredients are easily procured, and are comparatively cheap; (c) with proper precautions, it is comparatively safe in manufacture, in store, and in transport; it also keeps well in a moderately dry atmosphere.

The earliest gunpowder used in cannon in Europe consisted of equal parts of saltpetre, charcoal, and sulphur, ground up and mixed together as required, and must have proved a mixture far inferior in strength to that given in the MS. of Marcus Græcus. To account for the use of such a very weak composition long after better proportions had been ascertained, it must be remembered that the earliest cannon were composed of iron staves roughly hooped together; and tubes of thin iron, or even of wood or leather, with rope coiled round them, were sometimes used. Indeed the effective application of gunpowder as a propelling agent involves a whole series of inventions, and it was doubtless chiefly owing to the backward state of mechanical science during the Middle Ages that such weak powders were employed. The slow growth of artillery science in Europe

Objects to be attained

Advantages of gunpowder

years' growth. The quality of the charcoal exercises the greatest influence upon the rate of combustion, so that both the description of wood used and the mode of burning are of the utmost importance.

By a series of experiments first made by Proust, and since repeated by English chemists, it has been found that 12 grains of various charcoals, mixed with 60 grains of saltpetre, give the following average volumes of gas:—

	Cubic inches.
Dogwood (<i>Rhamnus Frangula</i>).....	82
Willow (<i>Salix alba</i>).....	77
Alder.....	74
Filbert.....	72
Fir, chestnut, hazel.....	66
Overheated willow charcoal.....	63

The production of the strongest powder does not depend alone upon the evolution of the largest volume of gas, but the above table is of interest since the three descriptions of wood which head the list have long been considered by universal consent as the best adapted for the manufacture of charcoal for gunpowder. Dogwood (so-called, but in reality it is alder-buckthorn, *Rhamnus Frangula*, the French *bourdaine*) is an underwood of slow growth, usually obtained from Sussex, Belgium, or Prussia; it is cut about an inch in diameter, and packed in bundles 6 feet long. This wood is now used, both in England and on the Continent, for all military small-arm powders, as well as the best descriptions of sporting gunpowder. It has been found, moreover, that cannon powders made from dogwood charcoal are, other things being equal, much more violent in action than those manufactured with willow or alder charcoal. Accidents with powder made from dogwood charcoal have usually proved more destructive than those made with any other description. Alder and willow charcoal is used for making gunpowders for field and heavy ordnance, as well as for the commoner kinds of commercial powders; these woods are obtained from various parts of England, and should measure about 4 inches in diameter. The willow used is the *Salix alba*, one of the softest and lightest of English woods, white in colour, and of very rapid growth; the pith is circular, and tolerably large. Alder is considerably harder and denser in texture, and of slower growth; its colour is reddish-yellow, and the small pith triangular or bayonet-shaped in section. Dogwood has a very large pith in proportion to its size, circular, and of a red colour, which is preserved even after the wood is converted into charcoal.

The temperature at which the wood is charred exercises the most powerful influence upon the inflammability of the charcoal, and consequently upon the "explosiveness," or rate of combustion, of the gunpowder made from it. The higher the temperature the larger the proportion of hydrogen and oxygen expelled, and the nearer the approach of the charcoal to pure carbon; at the same time, it becomes more dense and incombustible, and the gunpowder made from it is comparatively slow in action, and gives a low initial velocity. Charcoal prepared at a low temperature is softer and more inflammable, and contains more volatile constituents; it makes a quicker burning powder, giving a higher velocity to the projectile, but also producing more strain or pressure upon the metal of the gun. The chief defect, however, of this "slack-burnt" charcoal, or *charbon roux*, as it is called from its reddish-brown colour, is its property of absorbing moisture more readily than denser charcoal; the powder manufactured from it is consequently more hygroscopic, and therefore more liable to deteriorate in strength from the effects of damp than that made with a more highly burnt charcoal. To show the great difference in inflammability caused by burning at low and high temperatures respectively, it may be stated that charcoal prepared at 500° Fahr. readily ignites at about 640°, while, if burnt at 1800° Fahr., nearly double the heat previously mentioned is

required to inflame it. The following table exhibits concisely the practical effects of different modes of preparing charcoal for gunpowder, the same kind of wood being used in each case; it shows (a) the analysis of the charcoals, and (b) the comparative initial velocities and pressures given by powders made in a precisely similar manner from those charcoals.

		No. 1. Burnt 7 hours at a low heat.	No. 2. Burnt 4 hours at a greater heat.	No. 3. Burnt 3 hours at very high heat.
Charcoal.	Carbon, per cent.	78.23	81.23	87.55
	Oxygen, and trace of } nitrogen. }	16.96	13.19	8.29
	Hydrogen. }	3.67	3.31	2.91
	Ash..... }	1.41	1.27	1.25
Initial velocity (feet per second)...		1417	1399	1353
Mean pressure in powder cham- ber (tons per square inch).....		16.83	13.54	8.85

For the manufacture of gunpowder, only the crystalline Sulphur electro-negative variety of sulphur soluble in bisulphide of carbon (see CHEMISTRY, vol. v. p. 498) is used. Sublimed sulphur, commonly called "flowers of sulphur," which consists of minute granules of insoluble sulphur enclosing the soluble variety, is considered unfit for gunpowder; the reason assigned has usually been that, from the mode of manufacture, it is impregnated with sulphurous and sulphuric acids, but Professor Bloxam points out that in all probability it is the fact of the sublimed sulphur consisting of the electro-positive insoluble variety, which exerts an injurious influence upon the gunpowder made from it. Sulphur performs the part of a second "combustible" in gunpowder; but there is no doubt that its chief value as an ingredient thereof arises from its great inflammability, owing to its tendency to combine with oxygen at a moderate temperature; it inflames at about 560° Fahr., thus facilitating the ignition of the powder. Its oxidation by saltpetre appears also to produce a higher temperature than is obtained with charcoal, thus accelerating combustion, and increasing by expansion the volume of gas generated. An excess of sulphur would, however, be injurious by increasing the solid residue, in which the sulphur is found combined in various forms after the explosion. Some authorities have considered that, from its non-absorbent properties, sulphur renders gunpowder less hygroscopic, and more compact and durable.

Powders made from exactly the same materials, mixed in the same proportions, yet differ greatly in "explosiveness," which has been defined as the rate at which the powder burns or is converted into gas. This quality will depend chiefly upon the following properties:—(a) extent of incorporation; (b) the density of the powder; (c) its hardness; (d) size of the grains or pieces; (e) shape of the grains; (f) amount of glaze. Although not altogether synonymous with strength, we may consider "explosiveness" as the quality upon which the value of gunpowder for any particular purpose chiefly depends.

Next to the selection of the precise description of charcoal to be used, no point in the manufacture of gunpowder requires such care and attention as the thorough intermixture of the ingredients,—the object being in fact to form out of the three components a new substance as nearly homogeneous as possible. It is usually considered that there is a limit of time beyond which no advantage is gained by continuing the "milling" or incorporating process; but it is certain that nothing that can be done to the powder afterwards will add to its strength, although we may modify its explosiveness, and that the very best powders, especially for small-arms, are milled the longest time. This question will be further treated under the head of manufacture.

No physical property affects the explosiveness of gunpowder as much as its density. By density we mean the quantity of matter actually present in a certain bulk of the powder. Thus, if different quantities of meal powder, containing the same proportion of moisture, be compressed into equal bulks, say, for example, into cylinders of equal size, that which contains the most meal will be the densest. Hardness has not necessarily a relation to density, for a substance may be hard, and yet possess little density. Increase of density can only be given by compressing the meal into a smaller bulk, while increase of hardness can be arrived at by pressing the meal in a moister condition.

Other things being equal, increasing the density decreases the initial velocity, and, *vice versa*, a less dense powder gives a higher velocity, but also a greater strain to the metal of the gun. This is due to the less dense powder burning more rapidly than that with a dense close texture. If two grains, or pieces of powder, of equal size and similar shape but very unequal density, be burnt upon a glass plate, the less dense one will be entirely consumed before the denser one has finished burning.

Freedom from fouling is a very important property in small-arm powders. From the experience gained in selecting a powder for the Martini-Henry rifle, it was found that, with the same description of charcoal, the slower the action of the charge the less fouling took place; this modification of action was easily obtained by raising the density, at, however, a corresponding sacrifice of velocity in the bullet. The reason assigned was that the quicker-burning powder caused a rush of gas past the lubricating wad before the latter had time to act properly. A dense hard powder which will take a high polish or glaze will evidently keep better, and bear transport better, than a more porous and therefore more friable grain, which would easily form dust. It will thus be seen that many considerations enter into this question of density.

The size of grain is one of the most important points to be considered as modifying the explosiveness of powder. Although a charge of powder appears to explode instantaneously, yet both ignition and combustion are comparatively gradual; the flame is communicated from one grain to another, and each burns in concentric layers until it is consumed, so that the combustion of the grains is not *simultaneous*. Meal-powder burns more slowly in air than when the powder is granulated, in consequence of the minuteness of the interstices; dust, especially in fine-grain powder, retards ignition by filling up the interstices. To go to the other extreme, as showing the advantage gained by granulating the press-cake, we may quote an experiment made some years ago. A small piece weighing 1.06 oz. was placed in a mortar, and a light ball placed upon it; when it was fired, the ball was not thrown out. An equal quantity broken into 15 pieces, projected the ball 3.3 yards; broken into 50 pieces, the ball ranged 10.77 yards; when the same weight of ordinary grained powder was used, the range was 56.86 yards. It is most unsafe to attempt to apply to the action of gunpowder, when fired under enormous pressure, and especially when employed in large charges, the conclusions arrived at from its combustion in air. We may, however, assert that the weight of charge, the density, and all other conditions being equal, a charge made up of large grains or pieces of gunpowder will burn more slowly, and exert a lesser *initial* strain upon the gun than one composed of small grains, owing to the total surface of combustion being diminished by increasing the size of the pieces; this has been abundantly verified by the results of experiments with heavy rifled ordnance. On the other hand, the larger grains afford larger interstices between them for the passage of the flame, thus facilitating the ignition of large charges. Hence, a gunpowder may

possess a low rate of combustion and yet a high rate of ignition, and *vice versa*. For each gun, or charge of gunpowder, there is doubtless a size of grain which would produce a maximum velocity with a minimum initial strain, but as each kind of cannon powder has to be employed in more than one piece of ordnance, it is necessary to select that size which will best suit all of them.

The same quantity of powder meal made into two grains of equal density, but different shapes, will take different times to burn; the larger the surface exposed the quicker will be the combustion of the grain. A sphere being the smallest form in which a given quantity of matter can be placed, it follows that a certain amount of meal powder compressed into a spherical form will take longer to burn than the same quantity made into the shape of a flat scale, exposing a large surface. The rounded form of grain is the most favourable for the transmission of the flame, the interstices being larger and more regular than in the case of elongated or flat grains fitting into one another. Hence we may conclude that, to secure *uniformity*, it is better to have the constituent grains as nearly as possible of the same shape, and the nearer this shape approaches a sphere the better.

The glazing process is one of considerable importance, Glazing. both with reference to the explosiveness, and also the keeping qualities of the gunpowder. As regards the former point, it undoubtedly modifies the violence of the combustion, and this it probably does by slightly retarding the ignition, a powder with a rough porous surface affording a better hold to the flame than one possessing a highly polished exterior. With the large "cubical" powder, used for heavy rifled ordnance, there is little or no appearance of what is commonly understood as *glaze*, or polish, from this process, but the corners and edges of the cubes are rubbed off, and the shape approximates more nearly to that of a sphere than is the case with the much lighter fine-grain powder; there seems to be also a certain hardening of the surface of the grains or pieces, partly the effects of friction, but probably due in part to the *sweating* the powder undergoes, a considerable amount of heat being generated in the glazing barrels. It is evident that, by taking away the sharp angles which would otherwise easily be converted into dust, and also by giving the grains a harder exterior, this process renders gunpowder the better able to bear transport, and to resist the deteriorating effect of a damp atmosphere. The addition of a thin coating of the purest graphite to cannon powders, although originally intended merely to modify the explosiveness, also renders the surface of the grains less absorbent. Military small-arm powders are never dressed with graphite; good fine-grain gunpowder will take a high finish without it, but, by its aid, a very inferior article can be polished up to a silvery brightness.

Moisture in gunpowder reduces the explosiveness by using Effect of moisture. up a portion of the heat generated by the combustion, to get rid of the water; therefore the property of withstanding the absorption of moisture is a very important one for gunpowder to possess. All powder will take up from a normally dry atmosphere a certain amount of moisture, which will depend to some extent upon its density, but to a much greater degree upon the description of charcoal from which it is made. Slack-burnt or red charcoal is greatly more hygroscopic than black charcoal, or that burnt at a high temperature; and the absorbent properties of gunpowder made from the former are but little reduced by raising the density. Large cannon powder contains a greater percentage of water than the fine grain, and the actual amount present in any given sample will be affected by the prevailing state of the atmosphere, especially if kept in wooden barrels. To show the considerable effect upon the initial velocity of projectile, and pressure in bore of gun

caused by comparatively slight variations in the amount of moisture, the following results may be quoted from the experiments of Noble and Abel. The samples of "pebble" powder used were specially prepared for the Committee on explosives, differing only in the amount of moisture contained in them.

Percentage of Moisture.	Muzzle Velocity. Feet per second.	Maximum Pressure. Tons per sq. inch.
0.7	1545	22.02
0.8	1537	21.38
0.9	1530	20.77
1.0	1523	20.18
1.1	1517	19.63
1.2	1512	19.12
1.3	1507	18.63
1.4	1502	18.18
1.5	1497	17.76

Keeping gunpowder in a very damp atmosphere will tend to separate the ingredients by dissolving a portion of the saltpetre, which crystallizes upon the surface of the grains or pieces.

FIRED GUNPOWDER.

Products of explosion.

In the explosion of gunpowder, the products of combustion are very materially affected by the conditions under which it is fired,—whether burnt in the open air, exploded under very great pressure in a tightly closed vessel, or the products allowed to expand in the bore of a gun. It may, however, be stated generally that the oxygen of the saltpetre converts nearly all the carbon of the charcoal into carbonic acid (CO_2), a portion of which combines with the potash of the nitre to form carbonate of potash ($\text{K}_2\text{O}.\text{CO}_2$), the remainder existing in the state of gas. The sulphur is for the most part converted into sulphuric acid (SO_3), and forms sulphate of potash, a large proportion of which, probably by secondary reactions, becomes hyposulphite and sulphide. The nitrogen of the saltpetre is almost entirely evolved in the free state, and the carbon not having been wholly burnt into carbonic acid, there is always a proportion of carbonic oxide (CO) present.

The decomposition is so complicated, and varies so considerably under different conditions of experiment, that it is impossible to represent the transformation by any single equation, but the following expression may give some idea of the primary reaction:—

There is a very large proportion of residue, which, on cooling, assumes the *solid* form. The experiments of Noble and Abel prove that it is *liquid* very shortly after the explosion; indeed, it is probable that at the moment of maximum temperature, the ultimately solid products are more or less in a state of vapour, being deposited in a very finely divided state as the temperature falls.

When a charge of gunpowder is exploded in the chamber of a gun, a large quantity of gaseous matter is evolved in a highly condensed state;—its tension, or expansive power, is, moreover, greatly increased by the heat generated during the transformation. The pressure being equal in all directions, the work done upon the projectile is due to the expansion of the permanent gases in the bore of the gun, which force is also considerably sustained—or the reduction of temperature due to the expansion in great measure compensated for—by the heat stored up in the ultimately solid residue. Any calculation which does not take this latter point into consideration will give far too low an estimate of the actual force of fired gunpowder (see EXPLOSIVES).

With our present state of knowledge, it may be stated in round numbers that the gases evolved by gunpowder, if it entirely fills the close vessel in which it is exploded, will occupy at a temperature of 0°C . and 760 mm. barometric

pressure, about 280 times the volume of the original powder, and will give a pressure of about 6000 atmospheres, or 40 tons per square inch.

In view of the very different results which have been arrived at by various eminent authorities who have experimented upon fired gunpowder, the following brief account of their researches may be useful:—

Robins, the father of scientific gunnery, in 1743 read before the Royal Society a paper describing experiments which showed that gunpowder, when fired, generated permanent gases, which, at the ordinary temperature and atmospheric pressure, occupied a volume 244 times greater than that of the unexploded powder. He further considered that the heat evolved was such that the tension of the permanent gases would be increased fourfold, and hence deduced the maximum pressure to be about 1000 atmospheres. In 1778 Dr Hutton communicated in the same manner an account of his celebrated researches on the combustion of powder; he deduced the maximum pressure to be about twice that given by Robins, or a little over 2000 atmospheres, differing from the latter chiefly as to the temperature, for he considered that the volume of gases generated would occupy, under ordinary conditions, 250 times that of the powder. He also deduced formulæ for giving the pressure of the gas and velocity of the projectile at any point of the bore, but no allowance is made for the loss of heat in proportion to the work done, that fundamental principle of thermodynamics being then unknown; the error thus occasioned is, however, in part compensated for by the heat stored up in the non-gaseous products. In 1797 Count Rumford sent to the Royal Society his experimental determinations of the pressures given by fired gunpowder, which are remarkable as being the first attempt to do this by direct observation. The closed vessel he used was, however, very small, being able to hold but 28 grains when filled, and he only succeeded in measuring the results up to a charge of 18 grains. His plan of operation was to ascertain by repeated trial the least weight which would just confine the products of explosion, and thence to calculate the pressure; this he deduced from two series of experiments, which, however, gave some very anomalous results, to be as high as 100,000 atmospheres for gunpowder exploded in its own space. In 1823 Gay-Lussac, the celebrated French chemist, estimated the volume of the permanent gases evolved at 450 times that of the powder fired, but General Piobert assigns very probable reasons for supposing the quantity of gas determined to have been doubled in error. Gay-Lussac found the percentage composition of the gaseous products to be 52.6 carbonic acid, 5 of carbonic oxide, and 42.4 nitrogen. In 1857 Bunsen and Schiskoff published (*Poggendorff's Annalen*, vol. cii. p. 325) the results of their very important experiments; their determinations were—(1) that the permanent gases represented only about 32 per cent. of the weight of the charge, and occupied at the standard temperature and pressure about 193 times the volume of the original powder; (2) that the heat generated by exploding gunpowder in a close chamber is about 3340°C .; and (3) that hence the pressure would be about 4374 atmospheres, or 29 tons per square inch. Major Rodman (Boston, 1861) published the results of extensive experiments carried on for the United States Government, in order to ascertain the pressures given by different powders in the bores of heavy guns. He employed a pressure gauge, which bears his name, and consists mainly of a piston to which is attached a knife edge acting upon a piece of soft copper, contained in a small cylinder at right angles to, and communicating with, the bore of the gun; this apparatus he also used to ascertain the pressure given by powder exploded in a closed vessel. The chief value of his experiments consists in their having established the fact that the size of the grain should be proportionate to the length and diameter of the bore of the gun. Von Karolyi (*Poggendorff's Annalen*, April 1863) carried out experiments from which he estimated that, for small-arm powder, the gases evolved occupied about 226 times the original volume, while cannon powder produced about 200 volumes. Captain Andrew Noble, F.R.S., of Elswick, and Professor Abel, C.B., F.R.S., chemist to the British War Department, carried out a most extensive series of experiments on "Fired Gunpowder" (*Phil. Trans. Royal Soc.*, 1875), probably the most complete ever made, and undertaken collaterally with the Government "Committee on Explosives;" their mean results may be summed up as follows:—

(A.) *When Fired in a Confined Space.*—(1) The products of combustion are about 57 per cent. by weight of ultimately solid matter, and 43 per cent. of permanent gases. (2) The latter occupy at 0°C . and 760 mm. barometric pressure about 280 times the volume of the original powder. (3) The tension of the products of combustion, when the powder entirely fills the space in which it is fired, is about 6400 atmospheres, or 42 tons per square inch. (4) The temperature of explosion is about 2200°C . (5) The chief gaseous products are carbonic acid, nitrogen, and carbonic oxide, with a little sulphydric acid and hydrogen. (6) The solid residue is mainly composed of potassium carbonate, sulphate, hyposulphate, and sulphide.

(B.) *When Fired in the Bore of a Gun.*—(1) The products of combustion, at all events so far as regards the proportions of solid and gaseous matters, are the same as in the case of powder fired in a close vessel. (2) The work on the projectile is effected by the elastic force due to the permanent gases. (3) The reduction of temperature due to the expansion of the permanent gases is in a great measure compensated by the heat stored up in the liquid (afterwards solid) residuo. (4) An expression is obtained showing the law connecting the tension of the products of combustion with the volume they occupy. (5) Equations are also deduced for the work that gunpowder is capable of performing in expanding in a vessel impervious to heat, and for the temperature during expansion. Thence the experimenters give a table showing the total work gunpowder is capable of performing in the bore of a gun, in terms of the density of the products of combustion, or the number of volumes of expansion. (6) The total theoretic work of gunpowder when indefinitely expanded (for example, in a gun of infinite length) is about 436 foot-tons per pound of powder.

They further ascertained that—(a) the fine-grain powders furnish decidedly smaller portions of gaseous products than large grain or cannon gunpowders; (b) the variations in the composition of the products of explosion, in a close vessel, furnished by one and the same powder under different conditions as regards pressure, and by two powders of similar composition under the same conditions of pressure, are so considerable that no chemical expression can be given for the metamorphosis of a gunpowder of normal composition; and (c) the proportions of the several constituents of the solid residue are quite as much effected by slight accidental conditions of explosion of one and the same powder in different experiments as by decided differences in the composition, as well as in the size of grain of different powders. It may, however, be remarked here that, while the pressures given in the bore of a gun are very seriously affected by the size of the grains or pieces of the powder, it was clearly demonstrated by these experiments that the force exerted by fired gunpowder is not affected by the apparent accidental variations in the nature of the secondary chemical changes resulting from the explosions; this fact renders the exact composition of the products of combustion of less practical importance.

The following table gives concisely the chief results arrived at:—

Authority.	Volumes of Permanent Gas Generated.	Heat Evolved by Combustion.	Tension of the Gases.	Pressure in Tons.
		Cent.	Atmospheres.	Per sq. in.
Robins.....	244	1000	6.75
Hutton.....	250	2000	13.5
Gay-Lussac.....	450 ¹	1850 ²	2137	14.3
Bunsen and Schiöckoff.....	193	3340 ²	4374	29
Noble and Abel.....	280	2200 ²	6400	42

¹As before stated, Plobert gives 1/2 as for halving these figures.

M. de Saint Robert determined experimentally the amount of work lost by the heat communicated to the gun to be about 250 grammes-units per gramme of powder in the case of a rifled musket. From the experiments of Noble and Abel this loss becomes reduced to as little as 25 grammes units per gramme of powder in a 10-inch gun. They have also calculated the energy in foot-tons from the initial velocity obtained, and hence deduced the percentage of the possible theoretic work which is actually realized for every rifled gun in the British service. This percentage, which they term the "factor of effect," is found to be greatest, viz., 93 per cent., in the case of the 38-ton gun, and least, 50.5 per cent., in the 7-pounder mountain gun, weighing 150 lb.

To determine the pressures, Noble and Abel employed two methods: (1) *directly*, by means of "crusher gauges," inserted at various points of the bore; this is an improvement on the Rodman piston gauge, the pressure being estimated by the amount of compression given to a small cylinder of pure soft copper; (2) *indirectly*, by means of the chronoscope invented by Captain A. Noble, which measures the velocity of the projectile at given points in the bore, whence the pressure can be calculated (see GUNNERY). These pressures will vary greatly, other conditions being the same, according to the "explosiveness" of the powder; the great object is to obtain a powder suited to the particular arm with which it is to be used.

Many foreign physicists are of opinion that the phenomenon of dissociation comes into play at the moment of maximum temperature, causing the carbonic acid gas (CO₂) to be decomposed into carbonic oxide (CO) and oxygen. However, Noble and Abel show that, if such be supposed to occur, the loss of heat absorbed by the decomposition would more than compensate for the increase of volume.

PREPARATION AND PURIFICATION OF THE INGREDIENTS.

The three ingredients of gunpowder may be purchased in the market in a prepared or refined state, and this is done to a greater or less extent by many powder makers. However, the royal gunpowder factory, as well as some of the great private firms, prepare and purify the materials required from the commencement, with the double object of insuring uniformity in the qualities of the

powders made, and of avoiding, so far as practicable, the introduction of the least particle of grit or other foreign matters, which might cause serious accidents.

The rationale of the refining process is based upon the fact that saltpetre is far more soluble in hot than in cold water, while the chief saline impurities found in grough nitre are almost equally soluble in either. Water at 212° Fahr. holds about seven times as much nitrate of potash in solution as water at 70° Fahr.; if, therefore, a saturated solution of saltpetre be made at a temperature of 212° Fahr., and the chlorides of sodium and potassium are contained in the liquor, as the solution cools to 70° Fahr., six-sevenths of the nitre will be deposited in the form of crystals, which can easily be removed, whereas the foreign salts will still remain in solution. The following is a brief account of the improved mode of refining saltpetre, introduced some years back at Waltham Abbey, and now adopted at the chief private factories in England. The refining coppers are capable of holding about 500 gallons each, and are fitted with false iron bottoms, which are perforated with holes to allow sand and other mechanical impurities to fall through. Being each charged with 250 gallons of water,—usually the "washings" of saltpetre previously refined,—and 40 cwt. of grough nitre, a fire is lighted beneath. In about two hours the greater part of the saltpetre is dissolved, and the solution begins to boil; the thick scum formed on the surface is carefully taken off, and cold water from time to time thrown in to induce it to rise, the boiling being continued until there is no more scum; the coppers are then filled up with cold water, and the solution again made to boil briskly for a few minutes, after which the fires are allowed to go down. In about two hours more the solution will have fallen to the proper temperature, 220° Fahr. (sp. gr. 1.53), for pumping out; it is then filtered through dowlas bags suspended on a frame, and conducted by troughs to the "coolers" or crystallizing cisterns at about 180° Fahr. These latter are large shallow pans of copper, in which the liquid is kept agitated either by long-handled wooden hoes, or by machinery; as it cools, fine crystals fall to the bottom, and are from time to time thrown upon inclined draining frames by means of perforated copper shovels. When the temperature falls below 70° Fahr., the agitation is ceased, and any large crystals which may afterwards form are left in the mother liquor. After being thus allowed to get rid of some of the liquor, the crystallized saltpetre, having almost the appearance of snow, and technically called "flour," is raked into the "washing-cistern;" it is there subjected to three separate washings with pure water, distilled being preferable, which is allowed to drain off through a plug hole at the bottom of the cistern. These "washings" are carefully conducted to an underground tank, and kept either for using in the refining coppers, or boiled down in "evaporating pots" holding about 300 gallons, until the liquid is sufficiently concentrated for the saltpetre to crystallize, when it is run into small copper pans, and set aside to cool; this course is also pursued with the mother liquor from the large cooling cisterns, and the resulting crystals treated as grough nitre, for these large crystals always enclose liquid containing impurities. After draining for a night the refined saltpetre is removed to store bins, and is ready for use without any further pulverization; the amount of moisture remaining in it, from 3 to 5 per cent., is then carefully ascertained, and allowed for in the mixing house. Neither the solid residue from the pots and coppers nor the mother liquor from crystallizing pans is thrown away, but by repeated boilings and evaporations every ascertainable portion of saltpetre is extracted, and the residue sold; it chiefly consists of chlorides of sodium and potassium, with some sulphates. The jute bags in which the saltpetre is imported are also boiled down.

The large percentage of saltpetre contained in damaged powder makes it worth while to extract the nitre by boiling in large coppers, filtering and crystallizing in small pans as before; the residuum is again boiled, and then thrown away. The sweepings from the powder houses, in various stages of manufacture, are "extracted" in the same manner.

Refined saltpetre for making gunpowder is tested as follows:—(1) with blue and red litmus paper, for acids or alkalies; (2) for the presence of chlorides, with solution of nitrate of silver; (3) for sulphates, with chloride of barium, forming the insoluble sulphate of baryta.

By the old method of refining the solution was left to crystallize in coolers, and the drained crystals fused or melted in iron pots at a heat of about 500° Fahr.; the molten saltpetre was then poured into moulds, broken up when cold, and ground under edge.

The wood for charcoal is cut in spring, so that the bark may strip off easily, and is stacked for about three years to season it, but a considerably shorter time will suffice. Being cut in lengths of 3 feet, the wood is packed in iron cylindrical cases termed "slips," which are then inserted in the "cylinders" or retorts, the latter being built into the wall in sets of three with a furnace underneath, arranged so as to allow of the complete regulation of the heat; the flames surround the retorts as nearly as possible. An opening is left in the rear end or lid of the slip, corresponding with a similar

opening in the retort, through which, by means of pipes, the inflammable gases resulting from the charring of the wood are conducted into the furnace and there burnt; this saves a considerable amount of fuel. There are also pipes which receive and carry off the tar and pyrolygneous acid produced. In the powder works of Messrs Hall & Son of Faversham, the retorts are disposed three on each side of the furnace, and the connecting pipes and dampers are so arranged that the gases from either set, or from any single cylinder, can be utilized for the charring of the wood contained in any of the others; by this means it is claimed that little fuel is required beyond the quantity needed to warm the furnace and partially char the first set of retorts.

That the wood is sufficiently charred is shown by the blue colour of the gas flame, which indicates the formation of carbonic oxide; the door of the retort is then opened, and the slip is withdrawn by means of tackling, and placed in a large iron cooler having a close-fitting lid, where it is left a few hours till cool enough to be turned out and put into store. The charcoal is carefully picked over by hand, to ensure its being of uniform quality, and is kept from ten days to a fortnight before being ground, to obviate the danger of spontaneous combustion, to which it is liable if ground too soon after burning; this arises from the heat generated by the very rapid absorption and condensation of oxygen from the air by the finely powdered charcoal.

Properly-made charcoal for gunpowder should be jet black in colour, and its fracture should show a clear velvet-like surface; it should be light and sonorous when dropped on a hard substance, and so soft as not to scratch polished copper. Slack-burnt charcoal, or that prepared at a very low temperature, is at once known by its reddish-brown colour, especially when ground, and this peculiarity can be recognized in the powder made from it, when reduced to a fine state of division. Charcoal burnt at a very high temperature is known by its hardness, metallic ring, and greater density.

In France, charcoal is prepared by injecting superheated steam into the retorts for a certain period.

The charcoal mill in shape resembles an enlarged coffee mill; a cone works within a cylinder, both being provided with diagonal teeth and ribs, wide apart at top, but gradually approaching one another below. The pulverized charcoal is thence conducted by a simple mechanical arrangement direct into a cylindrical frame or "reel," about 8 feet by 3 feet, set at a slope and covered with copper wire cloth of about 32 meshes to the inch; all that is fine enough to pass through the reel-covering falls into a bin which encases the reel, and the coarser particles pass on to a tub at the further end, in order that they may be ground over again. The ground charcoal store should always stand by itself, in case of spontaneous combustion taking place.

The sulphur from Sicily known as "Licara firsts" is employed for the best gunpowder; it undergoes a rough purification before importation, leaving from 3 to 4 per cent. of earthy impurities. Formerly these were removed by simply melting the "grough" sulphur in an iron pot, and then ladling it into large wooden moulds or tubs, saturated with water to keep the sulphur out of the cracks; when cool enough, these tubs were unhooped, and the top and bottom of each mould of sulphur cut off. In the present day, however, the sulphur is refined by distillation in a simple apparatus. A large iron "melting pot," or retort, is set in brick-work, about 3 feet above the floor, with a furnace underneath; this retort has a heavy movable lid, which is luted into the pot with clay, and in the lid is also an opening, closed by an iron conical plug. From the melting pot lead two pipes at right angles to one another, one to a large circular "dome," or subliming chamber, and a smaller pipe to an iron "receiving pot" placed on a lower level than the retort; the latter pipe has an iron casing or "jacket" round it, through which cold water is allowed to circulate. The communication of these pipes with the retort can be shut off or opened as occasion may require by means of valves worked from without.

A charge of about 5½ cwt. of grough sulphur in small pieces being placed in the retort and the furnace lighted, the pipe leading to the dome is left open, as well as the plug-hole in the lid, but that leading to the receiving pot is closed; after about two hours, a pale yellow vapour rises, when the plug in the lid is put in and the vapour allowed to pass into the dome, where it "sublimes" or condenses on the sides and floor in the form of a fine powder, known as "flowers of sulphur." In about three hours from the commencement, the vapour becomes of a deep iodine colour, when the pipe leading into the dome is closed, and that into the receiving pot opened, at the same time cold water from a tank overhead being allowed to circulate through the jacket; the vapour is then condensed in the pipe, and runs into the receiving pot below in the form of a clear orange-coloured fluid. When the jacket commences to get cold, the receiving pipe is closed, and the communication with the dome is reopened, so that the rest of the vapour may pass into it, the furnace doors being at the same time thrown back; the impurities remain at the bottom of the melting pot, and are thrown away. The flowers of sulphur thus obtained, being unfit for the manufacture of gunpowder, are placed in the melting pot as grough sulphur. A leaden pipe passes from the lid of the receiving pot

into a small wooden chamber lined with lead, in which any vapour still remaining uncondensed may be deposited, as in the dome. The distilled sulphur is allowed to cool down to about 220° Fahr., when it is ladled into wooden moulds, as above described, and set aside to cool. The tests for refined sulphur are the following:—(1) burn a small quantity on porcelain, when the amount of residuum should not exceed 0.25 per cent; (2) boil a little with water, and test with blue litmus paper, which it should only very feebly redden.

The sulphur from the moulds, being broken into pieces, is ground under a pair of iron edge runners, similar to those of the incorporating mills, but of less size; after this, it is passed through a reel similar to that used for sifting the charcoal, but covered with even finer copper wire-cloth, having 44 meshes to the inch.

MANUFACTURE OF GUNPOWDER.

The following list will give a general idea of the chief processes of manufacture, properly so-called, through which gunpowder passes, although it will be understood that more or less variation takes place in some of the very different descriptions of powder now made:—(1) mixing the ingredients; (2) incorporation, or "milling;" (3) breaking down the mill-cake; (4) pressing; (5) granulating, or cutting the press-cake; (6) dusting; (7) glazing; (8) second dusting; (9) stoving, or drying; (10) finishing.

The following is the most approved method of mixing. Mixing.

The ingredients are carefully weighed out in the proper ingredients for a 50 lb mill-charge, with an extra amount of saltpetre according to the moisture found to be contained in it; they are then placed in the mixing machine, which consists of a cylindrical gun-metal or copper drum, with an axle passing through its centre, upon which are disposed several rows of gun-metal fork-shaped arms, called "flyers," the machinery being so arranged that the flyers and drum revolve in opposite directions, and at different rates of speed. After being mixed in this machine for about five minutes, the composition is passed through a hand-sieve over a hopper, falls into a bag placed below, and is tied up ready for the incorporating mill; it is now called a "green" charge.

Fig. 1.

Fig. 2.

Figs. 1 and 2.—A, sectional elevation of incorporating mill, showing one runner and ploughs (*p, p*); C, curb of bed; M, machinery in tank, underground; D, drenching apparatus; *l*, lever-board, or shutter; *t*, tank; *f, f*, floor line.

The incorporating mill (see figs. 2 and 3) consists of a Incorporating circular iron or stone bed, about 7 feet in diameter, firmly

Characteristics of good charcoal.

Grinding the charcoal.

Sulphur refining.

fixed in the floor of the building, whereon a pair of iron or stone cylindrical edge-runners revolve; formerly, both were made of a dark grey limestone which took a high polish, but the newer mills have cast-iron beds and runners, the edges of the latter being now usually surface-chilled. The average diameter of the runners is 6 feet, and their width about 15 inches; they have a common axle, which rests in gun-metal bouches in a solid cross-head attached to a vertical shaft; this shaft passes through a bearing in the centre of the bed, and is in gear with the driving machinery, which is placed above the runners in the old water mills, and beneath the bed in cast-iron tanks in the new steam mills. Each runner weighs about 4 tons, and the speed averages 8 revolutions per minute. The bed has a sloping rim on the outside, called the "curb," and on the inside an edge

FIG. 3.—Plan of runners and bed.

formed by the "cheese," or bearing, through which the vertical shaft passes. The runners are not equidistant from the centre of the bed, one working the part of the charge near the centre, and the other the outer portion, but their paths overlap. Two "ploughs" of wood, shod with leather, are attached to the cross-head by arms and brackets; one working next the vertical shaft, and the other close to the curb, the ploughs throw the composition under the runners as it works away from the latter.

The charge, when spread evenly on the bed by means of a wooden rake, contains about 2 pints of water (the moisture of the saltpetre) and a further quantity of from 2 to 6 pints is added from time to time, according to the state of the atmosphere, for the threefold purpose of preventing powder dust from flying about, facilitating the incorporation, and reducing the effect of an explosion; if too wet, the runners would lick up the composition from the bed. During the time of working, the millman enters the mill occasionally, takes a wooden "shover," and pushes the outside of the charge into the middle of the path of the runners, so that every portion may be equally incorporated.

The action of the runners is a combination of rolling and twisting, and has, on a large scale, somewhat the effect of a pestle and mortar, crushing, rubbing, and mixing the ingredients, so as to effect an intimate union.

The time of milling depends upon the nature of the powder. For good fine-grain powders it varies from four to eight hours, but the very best sporting gunpowder is said to be as long as twelve hours, under the runners; blasting and cannon powders are incorporated from two to four hours, the period being rather longer where the lighter stone runners are used. It is of the greatest importance that the mills should be carefully attended to by experienced men, as the whole goodness and uniformity of the powder depends upon this process, and no after treatment can remedy defective incorporation.

When the composition, which has now become "mill-cake," is ready for removal from the bed, it should be homogeneous in appearance, without any visible specks of sulphur or saltpetre, and of a dark greyish or brownish colour, according to the charcoal used. The mill-cake is carefully tested to ascertain whether it contains the proper amount of moisture; this should be from 2 to 3 per cent. for

fine-grain powders, and 3 to 5 per cent. for the larger descriptions. Sometimes a small portion is roughly granulated, and "flashed" on plates of glass or porcelain; a good powder should flash off, leaving nothing but some smoke marks, but, if badly incorporated, the plate will be coated with specks or beads of solid residue.

In former days the ingredients were incorporated in "stamp-mills," which were simply large mortars and pestles, the latter merely raised up by some cam arrangement and allowed to drop by their own weight, the charge being about 12 lb, and the weight of the stamp 50 lb or thereabout. The stamp or *pilon* mills are still used in France and Germany, as well as the *moulins-à-tonneur*, in which the composition is put, with about an equal weight of brass or lignum vitæ balls, into large barrels, which are made to revolve for a certain time on their axes; this method of incorporation is sometimes employed in conjunction with edge runners.

There is more danger of an explosion during the milling than in any other process of manufacture; but, owing to the limitation by law of the weight of charge permitted to be under the runners at one time to 50 lb, as well as to the great precautions taken, there is seldom any fatal result. The millmen only enter the mill occasionally to "liquor" the charge or give it a shove over, and at Waltham Abbey they wear incombustible clothing with a cap fitting over the ears, and gauntlets of the same material. The roof, and front and rear sides of the mills are usually constructed of very light boards, or even of canvas on a wood frame, while the partitions between each pair of runners are of solid masonry. The force of the explosion of a mill charge materially depends upon the length of time the incorporation has been in progress.

Directly over the bed of each mill is a flat lever-board or "shutter" (see fig. 1) in gear with a tank of water, so arranged that, when the shutter is raised on its pivot by an explosion, the water is upset into the bed; a horizontal shaft connects all the shutters in a group of mills, so that the explosion of one mill at once drowns all the remaining charges. The set of tanks can also be pulled over by hand.

The process of breaking down, although a subsidiary one, is strictly necessary in order to reduce the mill-cake to a fine meal, so that it may be conveniently loaded into the press box, and receive as uniform a pressure as possible. The breaking-down machine (see fig. 4) consists mainly of two pairs of gun-metal rollers, set in a strong frame of

FIG. 4.—Breaking-down machine. H, hopper; B, endless band; R, rollers; M, boxes to receive meal.

the same material; one roller of each pair works in sliding bearings connected with a weighted lever, so that any hard substance may pass through without dangerous friction. An endless canvas band, having strips of leather sewn across it, conveys the pieces of mill-cake from a hopper, capable of holding 500 lb to the top of the machine,

where it falls between the first pair of rollers; after passing through the second pair, which are directly below, the meal is received in wooden boxes, placed upon a carriage, and is ready for the press.

The press-box is usually of oak, with a strong gun-metal frame, and so constructed that three of the sides can turn back on hinges, or be screwed firmly together. Being laid sideways, the top temporarily closed by a board, and the uppermost side alone open, a number of copper plates

are placed vertically in the box, and kept apart (at a distance depending upon the description of gunpowder required) by two racks, which are afterwards removed; the box is then loaded with some 800 lb of meal, which is rammed evenly down between the plates with wooden laths, and the racks withdrawn, so that the plates are only separated by the meal between them. The present

upper side of the box being firmly screwed down, the box is turned over, and placed on the table of the hydraulic ram, under the fixed press-block, the plates being now horizontal (see fig. 5). The pumps which work the press (in a separate house) are then set in motion, and the press-block allowed to enter the box a certain distance, when the edge of the latter releases a spring catch and rings a bell as a signal to stop the pumps; the powder is kept under pressure a few minutes, after which the ram is lowered, and the box removed and unloaded. For all granulated powders the press-cake is broken up into pieces and put into tubs, but for the cubical cannon powders the slabs are pressed to the exact thickness required, and are carefully kept whole.

The above mode of regulating the pressure is found to give more reliable results than trusting to the indicator gauge of the hydraulic press, for the reason that the elasticity, or resistance to pressure, of the meal varies with the amount of moisture present in it, and the state of the atmosphere. To get uniform density, equal quantities of meal, containing equal amounts of moisture, must be pressed at the same rate into the same space. In practice, however, the moisture in the meal will slightly vary, whatever care be taken with the mill-cake, owing to the hygrometric state of the air causing a difference by the time it comes to the press. It is therefore necessary to alter the exact distance the press-block is allowed to enter the box, not only with the nature of the powder, but with the season of the year, and even according to the prevailing state of the weather.

On the Continent, the operation of pressing is sometimes altogether omitted, and the requisite density given merely by the weight of the runners revolving very slowly, the charges being worked with a considerable amount of moisture in them, and the less dense edges of the cake rejected; by this plan it is, however, almost impossible to ensure *uniformity* in the powder produced. The meal is also sometimes pressed by passing it, on an endless band, between large rollers revolving at a slow speed, the less dense edges of the cake being cut off by fixed knives.

FIG. 5.—Press. A, press-box; B, press-block; C, hydraulic ram.

For some centuries, gunpowder remained in the form of dust or "meal," being, in fact, simply the ingredients ground up together. Granulating or "corning" the powder was a great step in advance, but it is doubtful whether this operation was intended to increase its strength, or merely to render it more convenient for charging small-arms, for which alone corned powder was used for many years, whilst meal powder was still employed for heavy guns; the latter was called "serpentine" powder in the time of Edward VI., probably in allusion to the name of one of the pieces of ordnance then in use. However, during the reign of Elizabeth, the experience of the great additional strength imparted by the corning process, for the reasons already explained, led to the universal introduction of corned powder, except for priming,—both in cannon and small-arms,—for which purpose meal powder remained in use as late as the reign of Charles I.

The old method of granulating was to place the press-cake in sieves, provided with two bottoms of thick parchment prepared from bullock's hides, and perforated with holes, those in the lower bottom being much the smaller; a large number of these sieves were attached to a wooden frame, hung by ropes from the ceiling, which received a violent shaking motion by means of a crank underneath. Into each sieve was put a disk of *lignum vitæ*, to break up the cake, and force it through the larger apertures; the grain produced was retained between the bottoms of the sieves, the dust passing through the fine holes in the lower ones, and falling on the floor of the house. The grain was afterwards separated into sizes by being passed through wire sieves. These machines were clumsy and dangerous; and the accidents which happened with them have caused them to be generally supplanted by better apparatus, although some of the old frames are still in use.

The granulating machines used in the royal factories in England and in India, as well as in the best private works, are constructed upon a principle introduced by Sir William Congreve, but since improved upon. Three or four pairs of gun-metal rollers with pyramidal-shaped teeth, are fixed obliquely one above the other in a strong framework (see fig. 6); the sizes of the teeth vary according to the kind of grain required, but decrease from the top pair, and for fine-grain powders, the lowest pair would be smooth; one roller of each pair works in a sliding bearing, having a counterweight attached to prevent undue friction. Each pair of rollers is connected with that next below, by a short rectangular screen of copper wire, while, underneath all the rollers, are placed, at the same slope, two or more long wire-screens fixed in a frame having a wooden bottom; both the frame and the short connecting screens are hung to the machine by strips of lance wood, and, when at work, a quick vibratory motion is given to all the screens by means of a loose smooth wheel attached to the screen-frame. A large hopper, which rises by the action of the machine, feeds the press-cake upon an endless canvas band, as in the breaking-down machine, and carries it to the top pair of rollers, whence it falls upon the first short screen; all that is fine enough to pass through is sifted out by the shaking action of the long screens below, and travels down upon whichever screen has meshes fine enough to retain it; the pieces too large to pass through the short top screen are carried to the next pair of rollers, and so on. At the lower end of the long screens are placed boxes to receive the different sizes of grain; the "chucks," or pieces too large for any grain, are again passed through the machine, while the dust which falls upon the wooden bottom, and is received in the innermost box, goes to the mills to be worked up for forty minutes as a dust charge. Formerly at Waltham Abbey, both musket (F.G.) and cannon powder (L.G.) were gradu-

lated in the same machine at the same time, but dogwood charcoal being now used for small-arm powders, one description only is usually made, so that but two long screens are required to define the higher and lower limits as to size of grain; for example, all that will pass through a 12-mesh and be retained upon a 20-mesh screen would be "rifle-grain" (R.F.G.) powder, suited as to size for the Saider and Martini rifles. Modifications of this machine are used by private makers, the grain being usually separated into various sizes by hand-sieves.

Pebble or cubical powders for heavy ordnance are granulated, or "cut," in special machines which divide the press-cake first into strips, and then again cross-ways, into cubes of $\frac{3}{8}$ inch and $1\frac{1}{2}$ inch length of edge respectively. This is effected by two pairs of gun-metal or phosphor-bronze rollers, which have straight cutting edges arranged at suitable intervals along their surfaces, the slabs of press-cake being fed vertically between the first pair of rollers. The resulting strips are carried along upon a board, by means of a skeleton band, which receives each strip of cake

FIG. 6.—Granulating machine. A, bopper, with raising arrangement; B, endless band; C,C,C,C, four pairs of rollers; D,D,D, short screens; E,E, long screens; F, box for dust; G, box for grain; H, box for chucks; K, bottom board.

between two laths of wood; they then drop from the board upon an endless canvas band a little below, travelling in a direction at right angles to their previous motion, and are conveyed *endways* to the second pair of rollers. To prevent the strips of cake from fouling one another, the board upon which they first fall has a reciprocating motion given to it by means of an endless chain, one link of which is studded

view. Slope-reels are open at both ends, fixed at an angle of about 4° , and are used for fine-grain powders as they come from the machine, when they contain more dust than the larger grain, especially if made from dogwood charcoal; the powder is poured in at the higher end, and received in barrels at the other end. The larger grained powders are dusted for about half an hour in a horizontal reel, with closed ends, the charge being from 250 to 300 lb; one end of the reel is made to lower for the purpose of unloading. Both kinds of reel are enclosed in cases to receive the dust, which, as before, is sent back to the incorporating mills for 40 minutes or so.

FIG. 7.—Rollers of cube-cutting machine.

to a bracket underneath the board; consequently, as the board travels backwards, the strips are deposited at intervals, *in echelon*, upon the canvas band. The diagram (fig. 7) shows a portion of the machine. The cubes, &c., fall into a small reel fixed at a slope beneath the machine, which allows the dust and fragments to pass between its wires while the properly sized pebbles or cubes are delivered into boxes. The large $1\frac{1}{2}$ -inch powder has, however, afterwards to be picked over by hand.

The theory of glazing gunpowder has already been discussed. All descriptions are glazed, for varying periods, in glazing barrels or "churns" (fig. 8), which are usually about

All grain from the granulating machine is called "foul-grain," and has to be deprived of its dust in reels, consisting of a cylindrical frame-work about 8 feet long by some 2 feet in diameter, covered with a dusting cloth or canvas of from 18 to 56 meshes to the linear inch, according to the size of grain. These reels are either "horizontal" or "slope," according to the position in which they are fixed and the object in

FIG. 8.—Glazing barrels. A, elevation, showing door of case; C, hoppers for loading; B, section through barrel (showing opening in dotted lines).

5 feet long by 2 to 3 feet in diameter, and revolve some 34 times in a minute; however, barrels of much greater diameter and less length are occasionally employed, revolving at a slower rate. The charge for each barrel is ordinarily 400 lb, and the fine-grain powders are mixed with a pro-

portion of the "chucks" or larger pieces, which are afterwards sifted out. The glazing process causes a great alteration in the appearance of the grain, especially in that made from dogwood; the dull brownish hue is replaced after a few hours by a fine black colour with more or less polish. Some powders are glazed from 10 to 12 hours, a considerable amount of heat being generated by the friction. Fine-grain powders are again passed through the slope reel after glazing.

All kinds of gunpowder are dried in the same manner. The "stove," or drying room, is fitted with open framework shelves or racks, the heat being produced by steam pipes underneath. The powder is spread upon either copper trays or wooden frames with canvas bottoms, each capable of holding about 12 lb, which are then placed upon the racks. Not more than 50 cwt. may be dried at one time. The length of time required for stoving depends upon the nature of the powder, and the proportion of moisture it contains; it varies from about twelve hours for fine-grain up to three or four days for the very large cannon powders; the heat ranges from 120° to 145° Fahr., the temperature being gradually raised or lowered. It is most important that a stove should be well ventilated, so that a constant current of hot dry air may be supplied, and the air charged with vapour carried off; if this be not done effectually, the moisture would be recondensed upon the powder as the temperature was lowered.

Finish-
ing. The drying process produces a small portion of dust which it is necessary to remove; but the finishing process has, especially upon the fine-grain powder, a much more considerable effect than the mere removal of dust. It is usually finished by being run from two to three hours in a horizontal reel (see fig. 9), the charge being 300 lb, and acquires a very glossy appearance, if the quality be good, even without the addition of graphite, which is very commonly added to sporting gunpowder. Large cannon powder, such as "pebble" and "cubical," is finished in large skeleton wooden reels, shaped like barrels, and enclosed in cases; after being run for about three quarters of an hour,

FIG. 9.—Horizontal Dusting Reel (longitudinal section). A, cylindrical reel; B, reel case; C, apparatus for lowering one end for unloading; D, hopper for loading; E, opening in reel for loading; F, barrel for unloading into.

a small portion of the purest graphite (2 oz. to 400 lb of powder) is introduced in muslin bags, and the powder is run for a short time longer. This skeleton reel will hold a whole "glazing," as the contents of four glazing barrels is termed, being about 16 barrels of 100 lb each, and advantage is taken of this finishing process to mix together a number of glazings, so as to get a batch of 50 or 100 barrels giving uniform results at proof. These batches are afterwards "blended" together in four-way hoppers, with others of opposite character, should they not in all respects be up to specification, and any quantity of gunpowder so finished or blended as to give identical results at proof is termed a *brand*, and receives a distinctive number.

Upon the introduction of very heavy ordnance, firing large charges, it was found that the ordinary (L.G. or R.L.G.) cannon powder was too *sudden* in its action, owing to the whole charge being consumed before the projectile had sensibly moved from its seat in the bore, thus causing a most violent strain to the metal of the gun. To obviate this defect, the grains or pieces were made much larger, so as to diminish the total surface of combustion, and, consequently, the volume of gas evolved at the first instant of explosion; the powder was also given a considerably higher density, which retarded its combustion. These changes resulted in the adoption of the pebble and cubical powders, already mentioned, in England, and in America, of "Mammoth" powder, consisting of large, irregular-shaped grains (*k*, fig. 10) from 0''·6 to 0''·9 in size; an improvement has since been made in this powder by pressing it in uniform-sized pieces, of the shape shown in *i*, fig. 10, being the frusta of two hexagonal pyramids, separated by a prismatic space left rough.

Fig. 10.

The figures *a* to *k* show the relative sizes and shapes of grain now commonly employed for military purposes in Europe and America, except that the three largest powders—pebble (*e*), prismatic (*f*, *g*), and cubical (*h*)—are figured half the real size to save space, whereas the remainder indicate the actual dimensions of the grains. Powder for small-arms is represented in *a*; all the other descriptions are intended for cannon of various sizes.

The improvements above described materially lessen the *initial* strain, at the expense of requiring a longer gun to burn the powder completely, but it still remains true that, even with a charge composed of large, dense pieces, the evolution of gas is greatest at the commencement of combustion, and decreases as the grains burn away, although

the space occupied by the gases increases as the shot travels along the bore. This is exactly the opposite of what should theoretically take place, and causes the maximum pressure to be exerted before the inertia of the projectile has been overcome. So far back as 1860, these considerations led General Rodman, the eminent American artilleryman, to employ, in the experiments with his 15-inch and 20-inch cast-iron guns, what he termed a "perforated cake cartridge," composed of discs of compressed powder from 1 to 2 inches thick, and of a diameter to fit the bore, pierced with holes running parallel to the axis of the gun. In his *Properties of Metal for Cannon, and Qualities of Cannon-Powder* (Boston, 1861), Rodman demonstrated mathematically that such an arrangement of the charge would relieve the initial strain by exposing a minimum surface at the beginning of the combustion, while a greater volume of gas would be evolved from the increasing surfaces of the cylindrical hollows as the space behind the projectile became larger; this would tend to distribute the pressure more uniformly along the bore. The results of experiment perfectly bore out his theory, but he found it more convenient for several reasons to build up the charge in layers of hexagonal "prisms" of comparatively small size, fitting closely to one another, instead of having the cakes or discs as large as the bore.

The civil war in America most probably interfered with the further development of General Rodman's powder, but the idea was taken up by a Russian military mission in the United States, and resulted in the manufacture on a large scale by Russia of what is now known as "prismatic powder." It has since been adopted in Germany for use in all heavy rifled ordnance; for the very largest guns, such as Krupp's 70-ton gun, this powder has been recently made with one central hole, having a higher density (1.78) than the original seven-hole prisms, which were about 1.68; the external dimensions are the same, 1 inch high by 1.36 in diameter. The prisms are so arranged in the cartridge that the hollows are continuous throughout.

Prismatic powder represents a distinct class, the peculiarity of which is that each grain or piece is pressed separately in a metal mould. In the British service, powder for heavy rifled guns, in the shape of small cylindrical pellets, with a hollow half-way through, was made some twelve years since, but has been superseded by the pebble or cubical powder cut up from press-cake. To make this class of gunpowder, whether prismatic or cylindrical, we need—(1) a mould in which to place the meal or granulated powder; usually a number of moulds are contained in one plate; (2) a punch to fit each mould accurately with which to compress the powder, and needles to form the perforations; (3) an appliance for pressing the finished pellets or prisms out of the moulds; or this may be done by the punches themselves, if the moulds are closed by a removable upper plate.

The requisite pressure may be given either by hydraulic machinery, as at Waltham Abbey, or by means of a cam or eccentric on a shaft driven by steam or water power, as in the Russian and German prismatic machines. By the former plan a large number of pieces may be pressed slowly at one operation, but by the latter only about six prisms can be formed at a time; the machine, however, works very quickly, and has a small hopper for the meal or grain, and a self-feeding apparatus, the mould plate sliding backwards and forwards, so as to be alternately underneath the hopper and punches. Self-feeding machines of this nature are found to get clogged when used with powder-meal, and this was doubtless the chief reason why granulated powder was first used; the size of grain is about that shown in fig. 10, *b*. It is probable that a more uniform density could be given to the prisms by hydraulic

pressure than by the cam arrangement; the latter is said to exert a maximum pressure of 2000 lb on the square inch. The prismatic powder only needs careful drying at a moderate heat to finish it.

It has been found that all powders thus made possess less explosiveness than those granulated or cut up from press-cake; the smooth surfaces of the pieces apparently afford little hold for the flame, and thus they ignite slowly; by some this is considered a defect, but by others an advantage. For this reason, as well as those already detailed, prismatic powder strains the metal of the gun less, in proportion to the velocity obtained, than pebble or cubical, but, to give the projectile an equal velocity, the charge of prismatic must be considerably larger. The cost would probably be also greater, weight for weight.

PROOF OF GUNPOWDER.

The tests to which powder is subjected are as follows:—

1. *For proper Colour, amount of Glaze, sufficiently hard and crisp Texture, and Freedom from Dust.*—These points can be judged by the hand and eye alone, and require a certain amount of experience in the examiner. The cleanness of the powder is tested by pouring a quantity from a bowl held 2 or 3 feet above the barrel; if there be any dust it will be thus easily detected. If it is injured by damp there will be little or no dust, but the grain will be "rotten," and may be broken between the fingers; minute crystals of saltpetre may be also detected on the surface in a good light.

2. *For proper Incorporation.*—By "flashing," that is, burning a small quantity on a glass, porcelain, or copper plate. The powder is put in a small copper cylinder, which is then inverted on the flashing plate; this provides for the particles being arranged in nearly the same way each test, which is very important. If the powder be very large, it must be broken up and sifted to a certain size through a small hand-sieve. Properly made gunpowder should "flash," or puff off, when touched by a hot-iron, with few "lights" or sparks, leaving only some smoke marks on the plate. A badly incorporated powder will give out a quantity of sparks, and leave specks of uncombined saltpetre and sulphur, forming a dirty residue. Powder made from very slack-burnt charcoal, or which has been injured by damp, will always flash badly.

3. *For Shape, Size, and Proportion of the Grains.*—Shape can be judged by the eye only, and the size of large powders can be measured, or the number of pieces to 1 lb counted; granulated powder may readily be sifted upon the two sieves which determine its higher and lower limits of size. The proportion of different sized grains is ascertained by using three or more sieves. For example, the Government small-arm powder is sifted with 12-mesh, 16-mesh, and 20-mesh sieves; all must pass the first, not less than three quarters be retained upon the second, and only one-sixteenth part is allowed to pass the last-named sieve.

4. *Density.*—Formerly this was ascertained by "cubing," or finding the exact weight of a carefully constructed box of known contents, when filled with powder in a particular manner. But as this plan gave only an approximate result, a mercurial densimeter has been substituted, by means of which the density can be ascertained to three places of decimals. Briefly, the machine determines with great accuracy the weight of a globe when it is (*a*) filled with mercury alone under a certain pressure, and (*b*) filled with a known weight (say 100 grammes) of powder and mercury under precisely similar conditions; then, if *S* be the specific gravity of mercury at the time of experiment, *W* the weight of globe filled with mercury alone, and *W'* the weight when filled with powder and mercury,

$$\text{Density} = \frac{S \times 100}{W - W' + 100}$$

5. *Moisture and Absorption of Moisture.*—The amount of water contained in gunpowder is found by drying a carefully-weighed sample in a water oven for a certain period; from the weight lost, when allowed to cool out of contact with the air before weighing, the percentage of moisture can be calculated. The hygroscopic test consists in exposing a dried sample in a box, kept at a uniform temperature, to an atmosphere artificially saturated with moisture, and ascertaining the increase of weight in a certain time.

6. *Firing Proof.*—The nature of this will depend upon the purpose for which the powder is intended. For sporting powders, it will consist in the "pattern" given by the shot upon a target at a given distance, or, if fired with a bullet, upon the "figure of merit," or mean radial deviation of a certain number of rounds; also upon the penetration it effects through boards. For military purposes the powder is now always fired from the rifle or piece of ordnance with which it is to be used, and the initial or "muzzle" velocity ascertained by the Le Boulengé electric chronograph (see GUNNERY), which measures the exact time the bullet or other projectile takes to traverse a known distance between two wire screens. By means of the "crusher gauges" already referred to, the exact pressure per square inch upon certain points in the interior of the bore can be found; the maximum pressure can be considerably modified by increasing the cubic air-space given to the charge in the powder chamber. The figure of merit is also taken for small-arm powder.

All gunpowder made by or for the British Government is subjected to very strict limits of specification upon all the above-named points.

GUNPOWDER PLOT. See RAWKES.

GÜNS (Hungarian, *Közseg*), the second town in importance of the Hungarian megye or county of Vas (Eisenburg), near the Styrian frontier, is favourably situated on the Gyöngyös, 47° 23' N. lat., 16° 31' E. long. It is the see of a bishop, and from 1648 until the recent administrative changes of 1876 was a royal free town. Among the more noteworthy buildings are the cathedral, episcopal palace, a seminary for priests, a gymnasium, the county-hall, a hospital, three monastic houses, a museum of Roman antiquities, a house of correction, and several manufactories of cloth and of earthenware. The agricultural products of the neighbourhood consist principally of fruit and wine; the trade in the latter especially is considerable. In 1870 the number of inhabitants was 6916, mostly of German extraction. The heroic defence of the fortress of Güns by Nicolas Jurisics against the army of Sultan Soliman, in August 1532, has given the town a special historical interest. In 1621 it suffered from the attacks of Gabriel Bethlen's troops, and in 1705 the suburbs were plundered and burnt by the forces of Francis Rákóczy. In 1729 and 1777 the town suffered much from fire, and in 1813, 1814, and 1821 from floods. The Eszterházy family long held valuable possessions in the neighbourhood, and one of their castles still stands at the northern end of the town.

GUNTER, EDMUND (1581-1626), was of Welsh extraction, but was born in Hertfordshire in 1581. He was educated on the royal foundation at Westminster school, and in 1599 was elected a student of Christ Church, Oxford. After graduating bachelor and master of arts at the regular times,

he took orders, became a preacher in 1614, and in November 1615 proceeded to the degree of bachelor in divinity. Mathematics, however, which had been his favourite study in youth, continued to engross his attention, and on 6th March 1619 he was appointed to the professorship of astronomy in Gresham College, London. This post he held till his death, which took place on 10th December 1626. With Gunter's name are associated several useful inventions, descriptions of which are given in his treatises on the *Sector, Cross-staff, Bow, Quadrant, and other Instruments*. He had contrived his sector about the year 1606, and written a description of it in Latin. Many copies were transcribed and dispersed, but it was more than sixteen years afterwards ere he allowed the book to appear in English. In 1620 he published his *Canon Triangulorum*, a table of logarithmic sines and tangents (extended to 7 decimal places) for every degree and minute of the quadrant. In later editions an account of the general use of the canon is prefixed, and Briggs's logarithms of the first 1000 numbers are appended. There is reason to believe that Gunter was the first to discover (in 1622 or 1625) that the magnetic needle does not retain the same declination in the same place at all times. By desire of James I. he published in 1624 *The Description and Use of His Majesty's Dials in Whitehall Garden*, the only one of his works which has not been reprinted. He introduced the words co-sine and co-tangent for sine and tangent of the complement, and he suggested to Briggs, his friend and colleague, the use of the arithmetical complement (see Briggs's *Arithmetica Logarithmica*, cap. xv.). His practical inventions are briefly noticed below.

Gunter's Chain, the chain in common use for measuring land, is 22 yards long and is divided into 100 links. Its usefulness arises from its decimal or centesimal division, and the fact that 10 square chains make an acre.

Gunter's Line, a logarithmic line, usually laid down upon scales, sectors, &c. It is also called the *line of lines* and the *line of numbers*, being only the logarithms graduated upon a ruler, which therefore serves to solve problems instrumentally in the same manner as logarithms do arithmetically.

Gunter's Quadrant, an instrument made of wood, brass, or other substance, containing a kind of stereographic projection of the sphere on the plane of the equinoctial, the eye being supposed to be placed in one of the poles, so that the tropic, ecliptic, and horizon form the arcs of circles, but the hour circles are other curves, drawn by means of several altitudes of the sun for some particular latitude every year. This instrument is used to find the hour of the day, the sun's azimuth, &c., and other common problems of the sphere or globe, and also to take the altitude of an object in degrees.

Gunter's Scale (generally called by seamen the *Gunter*) is a large plane scale, usually 2 feet long by about 1½ inches broad, and engraved with various lines of numbers. On one side are placed the natural lines (as the line of chords, the line of sines, tangents, rhumbs, &c.), and on the other side the corresponding artificial or logarithmic ones. By means of this instrument questions in navigation, trigonometry, &c., are solved with the aid of a pair of compasses.

GÜNTHER, JOHANN CHRISTIAN (1695-1723), German poet, was born at Striegen in Lower Silesia, on the 8th April 1695. After attending the academy at Schweidnitz, where he composed a number of verses of more than usual promise, he entered in 1715 the university of Wittenberg with the view of studying medicine; but he became idle and dissipated, contracted heavy debts, and came to a complete rupture with his father. In 1717 he went to Leipsic, where he obtained the friendship of Menck, and published a poem on the peace of Passarowitz, which acquired him an immediate reputation. Menck recommended him to the king of Poland, but unhappily the first time he appeared at court he was in a state of intoxication. From that time he led an unsettled and dissipated life, depending for an uncertain subsistence partly on money obtained for occasional poems and partly on the charity of his friends. He died at Jena, 15th March 1723, when only in his 28th year. Goethe pronounces Günther to have been a poet in the fullest sense of the term. As a lyrical poet he stands alone among his contemporaries for freedom, spontaneity, and sincerity of utterance; and his works as a whole give evidence of deep and lively sensibility, fine imagination, clever wit, and a true ear for melody and rhythm. An air of cynicism, however, which was the necessary consequence of his aimless life, is more or less present in most of his poems, and dull, vulgar, or impure witticisms are not unfrequently found side by side with the purest inspirations of his genius.

His collected poems were published in four volumes, Breslau, 1723-1735. They are also included in Tittmann's *Deutsche Dichter des 17ten Jahrh.*, Leipsic, 1874. A pretended autobiography of Günther appeared at Schweidnitz in 1732, and a life of him by Siebrand at Leipsic in 1738. See also Hoffman, *J. Ch. Günther, ein literarisch-historischer Versuch*, Breslau, 1833; and Roquette, *Leben und Dichten J. Ch. Günthers*, Stuttgart, 1860.

GUNTOOR, a town in Kistna district, Madras, situated on the Grand Trunk road, about 46 miles from Masulipatam, 17° 42' N. lat., 80° 29' E. long.; population 18,033. It is the headquarters of the sub-collector and the district judge of Kistna; and there is a considerable trade in grain and cotton. Guntoor was formerly the capital of a Circar (Sarkár) under the Mahometans; it was ceded to the French by the nizám in 1753. At the time of the cession of the Circars to the English in 1766, Guntoor was specially exempted during the life of Basálat Jang, whose personal *jáyír* it was. In 1788 it came into British possession, and was finally confirmed in 1803.

GURDÁSPUR, a British district in the lieutenant-governorship of the Punjab, lying between 32° 30' and 31° 36' N. lat., and between 74° 56' and 75° 45' E. long. Bounded on the N. by the native Himálayan states of

Kashmir and Chanba, on the E. by Kangrá district and the river Bias, on the S.W. by Amritsar district, and on the W. by Sialkot, the district of Gurdáspur occupies the submontane portion of the Bári Doáb or tract between the Bias and the Ravi. An intrusive spur of the British dominions runs northward into the lower Himálayan ranges, to include the mountain sanatorium of Dalhousie. This station crowns the most westerly shoulder of a magnificent snowy range, the Dháola Dhár, between which and the plain two minor ranges intervene. Below the hills stretches a picturesque and undulating plateau covered with abundant timber and made green by a copious rainfall, and watered by the streams of the Bári Doáb, which, diverted by dams and embankments, now empty their waters into the Bias directly, in order that their channels may not interfere with the Bári Doáb canal. The district contains several large and important hills or swampy lakes. Few facts can now be recovered with regard to the early annals of Gurdáspur. Our first distinct historical knowledge begins with the rise of the Sikh confederacy. The whole of the Punjab then was distributed to the chiefs who triumphed over the imperial governors. In the course of a few years, however, the famous Ranjít Singh acquired all the territory which those chiefs had held. Pathánot and the neighbouring villages in the plain, together with the whole hill portion of the district, formed part of the area ceded by the Sikhs to the East India Company after the first Sikh war in 1846. In 1861-62, after receiving one or two additions, the district was brought into its present shape, having its headquarters at Gurdáspur.

Owing to the numerous transfers of territory which took place between the census of 1855 and 1868, it is impossible to give a detailed comparison of their results. The enumeration of 1868 was taken over an area of 1822 square miles, and it disclosed a total population of 906,126 persons,—males, 501,247; females, 404,879. Classified according to religion there are—Hindus, 303,107; Mahometans, 422,196; Sikhs, 79,387; and "others," 101,436. Only six towns have a population exceeding 5000, namely, Batála, 26,897; Derá Manek, 7199; Dinánagar, 6626; Sujanpur, 6556; Kananaur, 6030; and Srígovindpur, 5531. Gurdáspur, the chief town and administrative headquarters of the district, had only 4137 inhabitants in 1875. The sanatorium of Dalhousie, 7687 feet above sea-level, though only returned as containing 2019 inhabitants, has a large fluctuating population during the warmer months. The district possesses throughout an excellent soil, except in some small patches on the Bias side, where sand covers the surface. The chief agricultural staples comprise wheat, barley, and gram for the spring harvest, with rice, pulses, cotton, and sugar-cane for the autumn crop. Abundant means of irrigation exist where required, either from canals, wells, or mountain streams; but in no part of the Punjab province can better crops be produced without such artificial aid. In 1875-76 the total cultivated area amounted to 855,675 acres, of which 140,639 acres were protected by irrigation against the effects of drought. The trade of the district consists mainly in the export of its agricultural produce. The imports are insignificant,—English piece-goods, salt, and fancy articles forming the main items. The local traffic centres on Batála. The principal road of the district connects Amritsar with Pathánot, at the foot of the hills, and passes through Batála, Gurdáspur, and Dinánagar. The total mileage of highways in 1875-76 showed 54 miles of metalled and 507 miles of unmetalled road. The total revenue in 1876 was £123,603. In 1875-76 the district contained 12 civil and revenue judges; and 14 officers exercised magisterial powers. In the same year the police force numbered 596 men, supplemented by a large body of rural watchmen. In 1875-76 there were 112 schools, having an aggregate roll of 5708 pupils. The climate of Gurdáspur is not unhealthy, but large swamps and excessive irrigation expose some neighbourhoods to malarious fevers and ague. The mean temperature for 1871 was 86° 85' in May and 53° 8' in December at Gurdáspur, and 67° 8' in May and 46° 96' in December at Dalhousie. The average annual rainfall for eight years ending 1873-74 was 30·96 inches. Seven charitable dispensaries afforded relief (1875-76) to 80,614 persons.

GURGAON, or GOORGAON, a British district in the lieutenant-governorship of the Punjab, between 27° 39' and 28° 30' 45" N. lat., and 76° 20' 45" and 77° 35' E. long. Bounded on the N. by Rohtak, on the W. and S.W. by portions of the Ulwar, Nabha, and Jind native states, on the

S. by the Muttra district of the North-Western Provinces, on the E. by the river Jumna, and on the N.E. by Delhi, the district of Gurgáon comprises the southernmost corner of the Punjab province, and stretches away from the level plain towards the hills of Rájputáná. Two low rocky ranges enter its borders from the south and run northward in a bare and unshaded mass toward the plain country. East of the western ridge the valley is wide and open, and essentially extends to the banks of the Jumna. To the west lies the subdivision of Rewári, consisting of a sandy plain dotted with isolated hills. Numerous torrents carry off the drainage from the upland ranges, and the most important among them empty themselves at last into the Najafgarh *jhil*. This swampy lake lies to the east of the civil station of Gurgáon, and stretches long arms into the neighbouring districts of Delhi and Rohtak. Salt is manufactured from lime in wells at several villages. The mineral products are iron ore, copper ore, plumbago, and ochre. Wolves, leopards, deer, jackals, hares, and foxes are found in the district. In 1803 Gurgáon district passed into the hands of the British after Lord Lake's conquests, and under their influence improvements made steady and rapid progress. On the outbreak of the mutiny at Delhi in May 1857, the nawáb of Farrukhnagar, the principal feudatory of the district, rose in rebellion. The Meos and many Rájput families followed his example. A faithful native officer preserved the public buildings and records at Rewári from destruction; but with this exception, British authority became extinguished for a time throughout all Gurgáon. After the fall of the rebel capital, a force marched into the district and either captured or dispersed the leaders of rebellion. The territory of the nawáb was confiscated on account of his participation in the mutiny. Civil administration was resumed under orders from the Punjab Government, to which province the district was formally annexed on the final pacification of the country.

The census of 1868 was taken over an area of 2015 square miles, and it disclosed a population of 696,646 persons—males, 370,251; females, 326,395. The Hindus number 480,307; Mahometans, 216,147; Sikhs, 130; and "others," 62. In 1875-76 there were four municipal towns, with populations as follows:—Rewári, 25,237; Ferozepore (Firozpur), 10,580; Palwal, 13,542; Farrukhnagar, 10,611. Gurgáon, the administrative headquarters, had in 1868 a population of 3539. Out of a total area of 1,267,335 acres, as many as 967,440 were returned in 1875-76 as under cultivation. The principal products are wheat, barley, *jowar*, *bajra*, gram, oil-seeds, pulses, cotton, and tobacco. Owing to the deficiency of artificial irrigation, Gurgáon must always be exposed to drought. Seven periods of dearth have occurred since the disastrous year of 1733. In 1833 and 1837 many villages, according to report, lost their whole population through death and emigration. The traffic of Gurgáon district centres entirely upon the town of Rewári, which ranks as one of the chief trading emporiums in the Punjab. Its merchants transact a large part of the commerce between the states of Rájputáná and the northern provinces of British India. Salt from the Sambhar Lake, together with iron, forms the principal import; sugar and English piece-goods form the chief items of the return trade. In 1871-72 the imports of Rewári were valued at £208,892, and the exports at £99,028. The means of communication are not of the highest order. One good metalled road traverses the district, from Delhi to Muttra, but the lines of greatest mercantile importance are unmetalled. The Rájputáná State Railway now passes through the district, with stations at Gurgáon, Jhársa, Jataoli, Kalipur, and Rewári. The total revenue in 1875-76 was £111,885. In the same year 13 civil and revenue judges had jurisdiction, and the police force numbered 605 men, supplemented by a body of village watchmen. The number of schools was 66, with a joint-roll of 3560 pupils. The summer heat of Gurgáon reaches a great intensity; no record of temperature, however, exists. The average annual rainfall for the eight years ending 1873-4 was 23.52 inches. The district contained 4 charitable dispensaries, affording relief (1875) to 18,034 persons.

GURNALL, WILLIAM (1616-1679), author of the *Christian in Complete Armour*, was born in 1616 at Lynn, Norfolkshire. He was educated at the free grammar school of his native town, and in 1631 was nominated to the Lynn scholarship in Emmanuel College, Cambridge, where

he graduated B.A. in 1635 and M.A. in 1639. Nothing is known of his history from the time that he left the university till 1644, when he was made rector of Lavenham in Suffolk; but it would appear from one of his letters that when he received that appointment he was officiating as minister at Sudbury. At the Restoration he signed the declaration required by the Act of Uniformity, and on this account he was the subject of a libellous attack, published in 1665, entitled *Covenant-Renouncers Desperate Apostates*. He died October 12, 1679, and was buried at Lavenham. The work by which Gurnall is principally known, *The Christian in Complete Armour*, was published in three separate volumes in 1655, 1658, and 1662, and soon became so popular that in 1679 a sixth edition had been called for. It consists of a series of sermons on the latter portion of the 6th chapter of Ephesians, and is more fully described in the title page as a "Treatise of the Saint's War against the Devil; wherein a discovery is made of that grand enemy of God and his people, in his policies, power, seat of his empire, wickedness, and chief designs he hath against the saints;" and a "Magazine from whence the Christian is furnished with spiritual arms for the battle, helped on with his armour, and taught the use of his weapon; together with the happy issue of the whole war." The work is more practical than theological; and its quaint fancy, graphic and pointed style, astonishing variety of scriptural application and allusion, and fervent religious tone render it still popular with a certain class of readers.

An Inquiry into the Life of the Rev. W. Gurnall, by H. M'Keon, appeared at Woodbridge in 1830, and a biographical introduction by the Rev. J. C. Ryle, chiefly founded on this pamphlet, was prefixed to an edition of the *Christian in Complete Armour* published in London in 1865.

GURNARD (*Trigla*). The gurnards form a group of the family of "mailed cheeks" (*Triglidae*), and are easily recognized by three detached finger-like appendages in front of the pectoral fins, and by their large, angular, bony head, the sides of which are protected by strong, hard, and rough bones. The pectoral appendages are provided with strong nerves, and serve not only as organs of locomotion when the fish moves on the bottom, but also as organs of touch, by which it detects small animals on which it feeds. Gurnards are coast-fishes, generally distributed over the tropical and temperate areas; of the forty species known seven occur on the coast of Great Britain, viz., the red

Trigla pleuracanthica.

gurnard (*T. pini*), the streaked gurnard (*T. lineata*), the sapphirine gurnard (*T. hirundo*), the grey gurnard (*T. gurnardus*), Bloch's gurnard (*T. cuculus*), the piper (*T. lyra*), and the long-finned gurnard (*T. obscura* or *T. lucerna*). Although never found very far from the coast, gurnards descend to depths of several hundred fathoms; and as they are bottom-fish they are caught chiefly by means of the trawl. Not rarely, however, they may be seen floating on the surface of the water, with their broad, finely-coloured pectoral fins spread out like fans. In very young fishes, which abound in certain localities on the coast in the months of August and September, the pectorals are comparatively much longer than in the adult, extending to the

end of the body; they are beautifully coloured and kept expanded, the little fishes looking like butterflies. When caught and taken out of the water, gurnards emit a grunting noise. Their flesh is very white, firm, and wholesome.

GURWAL. See GARHWÁL.

GUSTAVUS I. (c. 1496–1560), king of Sweden, commonly known as GUSTAVUS VASA, the surname being derived from the family arms, which were a bundle or sheaf, is justly celebrated as the founder of modern Sweden; he delivered it from the yoke of Denmark, introduced the Reformation, established law and order, and laid the foundation of its industrial prosperity. His family name was Ericson; he was born about 1496 of a noble house; and he was related to the powerful family of Sture. Gustavus was at a very early age called upon to suffer for his country. Sweden was still joined to the other Scandinavian kingdoms under the union of Calmar, Denmark being the leading state. Sweden was a reluctant member of this union, and King Christian of Denmark was obliged to maintain his supremacy with a high hand. In an expedition to Stockholm this king treacherously carried off the young Gustavus and other nobles as hostages to Denmark. After being detained in Jutland for above a year, Gustavus managed to escape in disguise to Lübeck, and the great Hanse town, ever jealous of the power of Denmark, furnished him with the means of returning to Sweden, where he landed in 1520. He had now formed the resolution to deliver his country from the oppression of the Danes. He went about from place to place trying to incite the people to revolt, but on all hands he met with apathy and even resistance. For some time his life was in extreme danger; he was hunted by the Danish authorities, and worked in disguise on the farms and in the mines of Dalecarlia. The barn in which he threshed corn is preserved as a state monument. He was on the point of fleeing over the hills into Norway, when tidings came of the Blood-bath of Stockholm, in which ninety of the nobles and leading men of Sweden, including the father of Gustavus himself, were executed by the Danish king. This deed roused the slumbering patriotism of the Swedes, especially of the hardy people of Dalecarlia, who now chose Gustavus as their leader (1520). They repeatedly defeated the Danish forces, and took the principal towns. By 1523 Stockholm was taken and Sweden delivered from the Danish yoke. At a great diet held at Strengnäs in that year Gustavus was elected king of Sweden. Finland was speedily recovered. After liberating his country, Gustavus set himself to the far harder task of reforming and settling it. Sweden was in a very backward and disorderly condition. The nobles had great power and many selfish privileges; the clergy were wealthy, and in the war of freedom had taken the side of the Danes; the peasants were poor and discontented. There was little respect for law; and the whole country was demoralized and disorganized. The reforms of Gustavus began with the church. The two brothers Peterson had already introduced the doctrines of Luther, and the chancellor Anderson had translated the New Testament into the native tongue. Vasa encouraged their efforts; in a great diet held at Westerås in 1527 he succeeded under the threat of abdicating in passing measures, by which the lands of the bishops were placed at his disposal, and full liberty was granted of preaching the gospel; but the support of the nobles had to be gained by a share of the spoils. The Reformation soon took deep root, but the troubles of Gustavus continued. He required to deal with a turbulent nobility; he had to beat off the exiled king of Denmark; thrice he needed to pacify a revolt in Dalecarlia; and he was forced to put forth the whole strength of his kingdom to quell a peasants' war in the south. The pretensions of Lübeck, which had given him real help in the war of freedom, and to which he owed a consider-

able sum of money, involved him in a war, by which he curtailed their commercial privileges. In all these difficulties Gustavus bore himself with equal energy and wisdom. In 1544 his position was so secure that the elective sovereignty was changed by the diet into an hereditary one. From this time till his death in 1560, except an unimportant war with Russia on the Finnish frontier, there was little to disturb the quiet progress of Sweden. Gustavus's home policy made an era in Swedish history. Law, order, and national spirit were encouraged and developed; schools were everywhere established, roads made, and foreign trade extended by advantageous commercial treaties with England and Holland. Nothing was too homely or minute for the supervision of the king; he was ready to encourage, scold, or instruct, whenever an opportunity offered in any department of industry. He even established model farms. His second and best-loved queen Margaret had a dairy farm on which twenty-two maidens tended the cows. While he avoided foreign war he did not neglect national defence; he left an excellent army of 15,000 men, and he created a considerable naval force. Altogether, few kings have done so much for any country as Gustavus Vasa did for Sweden. He was succeeded by his son Eric.

See Geijer's *History of the Swedes*; also an anonymous *History of Gustavus Vasa*, London, 1852.

GUSTAVUS II., or GUSTAVUS ADOLPHUS (1594–1632), the hero of Protestantism in the Thirty Years' War, and the first king of Sweden who played a great rôle in European history, was the grandson of Gustavus Vasa, and the son of Charles IX. He was born at Stockholm in 1594, and received an excellent education. As we learn from his friend and chancellor Oxenstierna, he gained in his youth "a complete and ready knowledge of many foreign languages, so that he spoke Latin, German, Dutch, French, and Italian as purely as a native, and besides had some foretaste of the Russian and Polish tongue." Even during his busier years, after ascending the throne, it is said that he was fond of reading the great work of Grotius, *De Jure Belli et Pacis*; also that he knew Greek, preferring Xenophon as a military historian to any other. He was introduced to the business of government at an early age; when he was only ten, his father required his presence at meetings of council and at the audiences given to foreign ambassadors. This early experience was needed; for, his father dying in 1611, he ascended the throne of Sweden in his eighteenth year. His position was a difficult one; after fifty years of civil strife, Sweden had lost the strong and compact organization which it had received from Gustavus Vasa; the finances were exhausted, the nobles were discontented, and the spirit of the people had declined. Abroad, Sweden was surrounded with enemies, Denmark, Russia, and Poland being in a state of chronic hostility with it.

To the difficult task before him the young king applied himself with equal skill and resolution. He attached the nobles to himself by his respect for their privileges and his genial manner, showed them a more honourable field of activity in a patriotic war, and even induced them to bear their due share of its financial burdens. The administration was reformed in all its branches, industry encouraged, and education greatly improved. In this way the national spirit was wonderfully raised; and Sweden was gradually prepared to play for the first time a great part in Europe,—a part which seemed so disproportionate to her natural resources. At his accession Gustavus was engaged in a difficult war with Denmark, which, besides its supremacy over Norway, occupied what is now southern Sweden. The peace of 1613 left their respective frontiers very much as they had been before the war. The war with Russia ended much more advantageously for Gustavus in the peace of Stolbova (1617), by which Sweden was confirmed in the possession

of the Baltic provinces stretching from Finland to Livonia. Gustavus clearly foresaw the advantage to Russia and the danger to Sweden if the former power were allowed to plant itself on the Baltic coast; and he now congratulated his country on a peace which assured her against such a risk. In 1620 Gustavus married a sister of the elector of Brandenburg, with whom he lived happily till his death. After being for many years engaged in an intermittent war with Poland, Sweden (1621) entered upon a more active conflict with that power. With some interruptions the struggle lasted till 1629, and proved an excellent training for Gustavus. Sigismund, king of Poland, was his cousin, and had at one time been king of Sweden, but had been forced to resign owing to his Catholic opinions. He still laid claim to the crown of Sweden. In this war Gustavus took Riga, and made many other conquests in Livonia as well as in Courland and Prussia, part of which he retained by the peace of Altmark, concluded under the mediation of Richelieu.

That great statesman wished to get Gustavus's hands free for a more important conflict, in which the king himself had long been eager to engage. While Gustavus had been involved in his Baltic war, the Catholic house of Austria had been swiftly raising itself on the ruins of German Protestantism to a position of absolute supremacy. In this early period of the Thirty Years' War which dates from 1618, the armies of Protestantism had been everywhere overthrown by Tilly and Wallenstein. The latter, raising a host at his own cost and bearing desolation wherever he went, garrisoned Brandenburg and Pomerania, occupied Mecklenburg, and overran the continental dominions of Denmark. The only town that successfully resisted the imperial general was Stralsund; the king of Denmark was obliged to make peace. Such a colossus, with its gigantic force of oppression and devastation and its invincible armies, Gustavus now ventured to attack. It seemed a foolhardy undertaking which excited the laughter of his enemies, when in midsummer 1630 he landed on the coast of Pomerania with his little army of 15,000 men. Yet there were many things in his favour,—the despair of the Protestant princes, who saw a great part of their lands threatened by the Edict of Restitution; the disunion of the Catholics, who forced the emperor to dismiss Wallenstein shortly after the landing of Gustavus; the help of Richelieu, who now inaugurated the French policy of weakening Germany by dividing it. This help was formally assured him by the treaty of Bärwalde (January 1631). Yet the German princes showed no haste to join Gustavus; the duke Boguslav reluctantly consented to receive the Swedish army into his capital—Stettin. But the marvellous discipline of the Swedes, so different from the wild barbarism of the imperial army, soon gained the confidence of the German people; robbery and licence were unknown; morning and evening the soldiers assembled for prayer round their regimental chaplains; such an army had never been seen in Europe. It was not less distinguished for its hardy bravery in war; keeping the field in winter as well as summer, it soon drove the imperialists out of Pomerania and the lower basin of the Oder, and stormed Frankfort-on-the-Oder. In the midst of those successes, Gustavus was greatly moved by the sack of Magdeburg (May 1631). Fearful of being cut off from his basis of operations, he could not advance to the relief of the city without the cooperation or consent of the electors of Brandenburg and Saxony. During the delay thus caused, Magdeburg was taken by Tilly, and became a scene of the most fearful atrocities. Too late Gustavus forced the elector of Brandenburg to hand over to him the fortresses required; a desolating invasion of Saxony by Tilly compelled even the Saxon elector to seek the aid of Sweden. The union of the Swedish and Saxon forces was followed

by the battle of Breitenfeld (near Leipsic), in which Tilly was completely overthrown, and the supremacy of Catholic Austria shattered at a single blow (September 1631). While the Saxons overran Bohemia, Gustavus, now hailed as the liberator of Protestantism, marched westwards towards the Rhine, gathering round him the friendly Germans, and driving out the imperial garrisons. Würzburg and Frankfort were occupied; at Oppenheim he forced the passage of the Rhine against the Spaniards; he spent Christmas in the ecclesiastical city of Mainz. Early next spring he advanced into Bavaria, forcing the passage of the Lech in the face of Tilly (who was mortally wounded). Munich had to pay a war contribution to the Swede.

In this overwhelming reverse of fortune, the emperor Ferdinand was obliged to invoke the aid of Wallenstein, who soon changed the course of the war. He gathered a mighty host, cleared the Saxons out of Bohemia, and marching westwards threatened the wealthy city of Nuremberg. Afraid of a repetition of the horrors of Magdeburg, Gustavus hastened northwards and threw himself into the city with a small force. In the neighbourhood Wallenstein threw up a fortified camp resolving to starve his rival out; and here the great captains watched each other for several weeks. After drawing his scattered forces together, Gustavus offered battle to the enemy, and when that was declined assaulted his intrenched position, but without effect. Leaving a sufficient garrison to defend the exhausted city, he advanced a second time into Bavaria, where he hoped to draw Wallenstein after him, and thus transfer the seat of war to the enemy's country. But Wallenstein made a desolating march through Thuringia into Saxony, which he resolved to make his winter quarters; and again Gustavus was obliged to leave his Bavarian conquests to save his ally from such a cruel guest. On a misty November day (1632) he attacked the army of Wallenstein at Lützen (near Leipsic). The numbers engaged were not great: according to Ranke, the Swedes were 14,000, the imperialists only 12,000 at the beginning of the conflict; but the battle was one of the fiercest recorded in history. The Swedes had carried the strong positions of the enemy and turned his own cannon against him, when the cavalry of Pappenheim, which had left the main army shortly before the battle, appeared on the field. The Swedes were hurled back; and the king, too eagerly hurrying forward to re-form the battle, was separated from his guards and shot. Wild with rage and sorrow the Swedes renewed the attack, overthrew the enemy, and won his artillery again. Without making any effort to recover it, Wallenstein retreated into Bohemia, while the Swedes carried the disfigured body of their king from the battlefield. It was laid to rest in the Riddarholm church at Stockholm.

Gustavus Adolphus is justly regarded as one of the noblest and greatest figures in history. Even in the art of war he made an epoch. To the huge and unwieldy masses of Tilly he opposed a light and flexible formation of three deep, which he manœuvred with unwonted rapidity. The activity of his movements was equalled by the dexterity with which his artillery and muskets were handled; at Leipsic his guns fired three shots for the enemy's one. The political plans which Gustavus entertained have been the subject of some discussion. That he aimed at founding a Swedish empire of the Baltic, and succeeded in doing so, is certain; he meant also to unite under his protection the *corpus evangelicum* of Germany. Probably too he aspired to become a candidate for the empire; and if so, he had only one disqualification, that he was a foreigner. Even with this drawback it would have been the best course available for Germany; to have enjoyed for a generation the rule of such a man would have been an unspeakable blessing, at any rate infinitely better

than the supremacy of Austria, or that process of desolation and disunion which actually took place. In any case his premature death at the age of thirty-eight was an irreparable loss for German Protestantism. The Thirty Years' War, which for two years had been rendered heroic by his presence, degenerated again into a scene of the wildest barbarism, by which Germany was reduced to a wilderness, and flung back at least a century in the march of civilization.

Schiller's *Geschichte des dreissigjährigen Kriegs* is a brilliant production, but written without a careful study of the sources.

(T. K.)

GUSTAVUS III. (1746-1792), king of Sweden, succeeded his father Adolphus Frederick at the age of twenty-five. He was in Paris when his father died, and was an enthusiastic admirer of everything French. His manners were popular; he was brave, resolute, and eloquent. At the beginning of his reign he found the royal power completely overshadowed by the nobles, who in the council virtually dictated the government of the country, and had involved it in frequent disturbance and disgrace. A revolt, contrived for the purpose by one of his adherents, gave Gustavus a pretext for marshalling his guards, whom he won over and employed to make a complete change in the constitution. As the nobles were disliked by the people, they were obliged to submit. Surrounded by soldiers, the diet accepted the new form of government, by which the entire administrative power including taxation was entrusted to the king. In many respects Gustavus made an excellent use of his great power; he improved the army and navy, reformed the administration of justice, abolished torture, and built hospitals. But his foolish aping of French fashions, and his dream of reviving the knightly exercises and accomplishments, led him into great extravagance. His arbitrary attempt to introduce a national dress, as well as the conversion of brandy, the national drink of Sweden, into a royal monopoly, lost him his popularity. In 1788 in his campaign against Russia, several nobles, officers of his army in Finland, refused to carry on the war because it had not been sanctioned by the estates. Angry at this Gustavus summoned the hardy Dalecarlians to his aid, deprived the nobles of their exclusive privileges, and made his power absolute. He continued the Russian war with great bravery and even success till the peace of 1790, which made no change on the Finnish frontier. Gustavus's next project, which he prosecuted with his usual energy and disregard of consequences, was a war to save King Louis XVI. from the Revolution. This war the estates, already weary of his expensive undertakings, refused to support. To avert a new *coup d'état* some nobles formed a conspiracy against him; and Ankarström, formerly an officer in the guard, shot him at a masked ball at Stockholm (1792).

GUSTAVUS IV. (1778-1837), king of Sweden, was son of the preceding. He was only fourteen years of age when his father was cut off, and his uncle Duke Charles acted as regent during the minority. Gustavus early gave proof of an obstinate strength of will and of a highly-wrought temperament bordering on insanity. Thus he went to St Petersburg, according to agreement, to marry a granddaughter of the empress Catherine, and the whole court was assembled for the ceremony. The bridegroom however did not appear, and the company dispersed after waiting several hours. Gustavus had drawn back at the eleventh hour, refusing to sign the marriage treaty because it bound him to grant his future queen the free exercise of

ner religion. He spent his whole reign under the mastery of a fixed idea, that Napoleon was the Great Beast spoken of in the Apocalypse; and he joined the great coalition of 1805 against the conqueror. In this war Swedish Pomerania was occupied by the French. Even after Tilsit, Gustavus prosecuted the war with unbroken resolution. Sweden suffered fearfully by this obstinacy of the king; the Russians conquered Finland; the Danes invaded the southern provinces; his English allies, wearied of his irrational obstinacy, left him to his fate. Sweden also grew sick of his wrong-headed policy. The officers of the army conspired against him. He was dethroned and detained in captivity, while his uncle Duke Charles was elected to the crown (1809). After the new arrangements had been made, he was banished with the assurance of a considerable income. Under the name of Colonel Gustavson he passed a wandering life abroad, dying at St Gall in 1837.

GUSTAVUS ADOLPHUS UNION (GUSTAV-ADOLF-STIFTUNG, GUSTAV-ADOLF-VEREIN, EVANGELISCHER VEREIN DER GUSTAV-ADOLF-STIFTUNG), a society formed of members of the Evangelical Protestant churches of Germany, which has for its object the aid of feeble-sister churches, especially in Roman Catholic countries. The project of forming such a society was first broached, in connexion with the bicentennial celebration of the battle of Lützen, on the 6th of November 1832; a proposal to collect funds for a monument to Gustavus Adolphus having been agreed to, it was suggested by Superintendent Grossmann that the best memorial to the great champion of Protestantism would be the formation of a union for propagating his ideas. For some years the society was somewhat limited in its area and operations, being practically confined to Leipsic and Dresden, but at the Reformation festival in 1841 it received a new impulse through the energy and eloquence of the Hofprediger Zimmermann of Darmstadt, and in 1843 a general meeting was held at Frankfort-on-the-Main where no fewer than twenty-nine branch associations, belonging to all parts of Germany except Bavaria and Austria, were represented. The want of a positive creed on the part of the Union tended from the first, however, to make many of the stricter Protestant churchmen doubtful of its probable usefulness; though on the other hand its purely negative attitude in relation to Roman Catholicism secured for it the sympathy of the masses. At a general convention held in Berlin in September 1846 a keen dispute arose about the admission of the Königsberg delegate Rupp, the founder of the "Free Congregations"; his exclusion, which was carried by a majority, called forth many energetic protests, and at one time it seemed likely that the society would be completely broken up. A peaceful solution of the difficulty, however, was reached at Darmstadt in 1847. Amid the complications of the Revolution of 1848 the whole movement fell into stagnation; but in 1849 another general convention (the seventh), held at Breslau, showed that, although the society had lost both in membership and income, it still was possessed of considerable vitality. From that date the Gustav-Adolf-Verein has been more definitely "evangelical" in its tone than formerly; and under the direction of Zimmermann of Darmstadt it has greatly increased both in numbers and in wealth. In 1853 the income was £13,500; in 1858 it had risen to £21,000; while in 1876 there was divided among 1406 congregations a sum of nearly £35,000. The total number of congregations assisted up to that date was 2558, and the sums distributed amounted to an aggregate of nearly £637,000. Apart from any influence it may have had in advancing the cause of Protestantism in places where it was struggling or weak, there can be no doubt that the Union has had a very great effect in helping the various separate Evangelical churches of Germany to

realize the number and importance of their common interests. It ought to be added that the stricter Lutherans still continue to hold aloof from it.

The Verein has numerous special organs, of which the most important are the *Darmstädter Bote des Evangelischen Vereins der Gustav-Adolf-Stiftung* and *Fliegende Blätter*. See Zimmermann's *Geschichte des Gustav-Adolf-Vereins*, Darmstadt, 1858.

GÜSTROW, the chief town of the Wendian circle of the grand duchy of Mecklenburg-Schwerin, Northern Germany, is situated on the Nebel and on the railway from Lübeck to Stettin, 20 miles south of Rostock. The principal buildings are the castle, erected in the middle of the 16th century, now used as a workhouse; the cathedral, dating from the 13th century, and lately renovated, containing many fine monuments and possessing a square tower 100 feet high; the town-hall, dating from the 16th century; the court-houses, the music hall, and the theatre. Among the educational establishments are the ducal gymnasium, which possesses a library of 15,000 volumes, the town real-school, the city school, the trade school, and four female schools. The town is one of the most prosperous in the dukedom, and has breweries, foundries, tanneries, sawmills, brandy distilleries, and manufactories of tobacco, glue, candles, and soap. There is also a considerable trade in wool, corn, wood, butter, and cattle, and an annual cattle show and horse races are held. Population (1875), 10,923.

Güstrow was a place of some importance as early as the 12th century, and in 1219 it became the residence of Prince Henry Burewin II., from whom it received Schwerin privileges. From 1556 to 1695 it was the residence of the dukes of Mecklenburg-Güstrow. In 1628 it was occupied by the imperial troops; and Wallenstein resided in it during part of the years 1628 and 1629.

GUTENBERG, JOHN, was born about 1410 at Mainz of noble parents, his father being Frielo zum Gänsfleisch, and his mother, whose name he adopted, Else zu Gutenberg. In 1420 the citizens of Mainz drove the patricians out of the city, and as Gutenberg's name appears about ten years later at Strasburg the family probably took refuge there. When the expelled families were recalled to Mainz, Gutenberg did not avail himself of the privilege. We next hear of him at Strasburg, where in 1434 he seized and imprisoned the town clerk of Mainz for a debt due by the corporation of that city, releasing him, however, at the urgent representations of the mayor and counsellors of Strasburg. In 1437 Gutenberg was sued before the ecclesiastical court by Emmeline zu Iserne-Thüre for breach of promise of marriage, the case being settled by his making her his wife. The active mind of Gutenberg had adopted several plans for making money before he invented the art of printing with movable types, which is his great claim upon the gratitude of mankind. Before 1425 he engaged in some experiments requiring money, when Andrew Dritzehn, a fellow-citizen, became security for him; and the same year a partnership between them was arranged to carry out Gutenberg's new plan for polishing stones. Next came an improvement in the manufacture of looking-glasses, for which money was lent by other two friends. For these a lucrative sale was expected at the approaching pilgrimage to Aix-la-Chapelle, which, however, was unfortunately postponed. In 1438 was arranged a partnership between Gutenberg, Andrew Dritzehn, Andrew Heilmann, and Anton Heilmann, and that this concerned the new art of printing appears from the long law proceedings which soon after followed. The action was brought by the brothers of Dritzehn, who was dead, to force Gutenberg to reveal the secrets of the partnership. The decision was in favour of Gutenberg. In January 1441 Gutenberg obtained 80 livres by mortgaging some house property, and again in 1442 he borrowed money of Martin Brether for carrying on his experiments. For four years after this nothing is known of Gutenberg except that his wife paid taxes

in his name. He now returned to his native city, Mainz, where he borrowed 100 guilders of his kinsman Arnold Gelthus, and established himself in the house Zum Jungen, which was part of the family possessions. At this time Gutenberg must have been able to show some solid and convincing results of his new invention, for he obtained substantial aid from a shrewd goldsmith, John Fust or Faust, who advanced 800 guilders to promote the work, taking as security a mortgage on all the printing materials to be purchased. Gutenberg at once set to work upon a large folio Latin Bible, the printing of which was ended before August 1455. During the progress of this great undertaking several forms of indulgence and other small things were printed, the earliest with a date being the Indulgence of 1454 in the library at Althorp. But the new art was certainly not a success commercially, and again Fust had to come forward with another 800 guilders to prevent a collapse. In November 1455 Fust determined to dissolve his connexion with Gutenberg, and demanded payment of his advances. Gutenberg not being able to refund so large a sum, Fust took legal proceedings against him, and he was eventually compelled to yield up the whole of the printing materials, which at once were removed by Fust to his own house at Mainz. Here with the assistance of Peter Schöffer he continued to print until the sack of the city in 1462 by Adolphus II. Gutenberg, now in the evening of life, had to make a fresh start in the world, and fortunately in Dr Humery of Mainz found a friend who assisted him with capital. Embarrassment, however, still pursued him, and the press made slow progress. It is uncertain whether the new press of Gutenberg was in Mainz or at the neighbouring town of Eltvill. On January 17, 1465, Gutenberg accepted the post, at the court of Archbishop Adolphus, of salaried courtier. He received annually a suit of livery together with a fixed allowance of corn and wine. Meantime the printing materials were lent to the brothers Bechtermunze, who printed some inconsiderable works, and upon the death of Gutenberg were claimed and taken by Dr Humery. On February 2, 1468, died Gutenberg, poor, childless, and almost friendless, after laying the foundations of an art which was soon to dominate the world. Arnold Gelthus erected a monument to his memory near his grave, and forty years afterwards Ivo Wittig set up a memorial tablet at the legal college in Mainz.

No portrait of Gutenberg is known, those appearing upon medals, statues, or engraved plates being all fictitious. The latest authority upon his life and work is *Gutenberg*, by Dr Van der Linde.

GUTHRIE, THOMAS (1803-1873), Scottish clergyman and philanthropist, was born at Brechin, Forfarshire, on July 12, 1803. He entered the university of Edinburgh at the early age of twelve (November 1815), and continued to attend classes there for more than ten years. During that period he seems to have read widely in general literature, although he did not distinguish himself as a student in the strict sense. On the 2d of February 1825 the presbytery of Brechin licensed him as a preacher in connexion with the Church of Scotland; but it was not till 1830 that he was inducted to his first charge, Arbirlot, in Forfarshire, where he laboured for seven years. In 1837 he became the colleague of the Rev. John Sym in the pastorate of Old Greyfriars, Edinburgh, and at once attracted notice as a great pulpit orator. Towards the close of 1840 Guthrie was chosen minister of St John's Church, Victoria Street, Edinburgh. His increasing popularity brought him flattering invitations both from London and from India; but these he firmly declined. He was an enthusiastic supporter of the movement which led to the Disruption of 1843; and his name is thenceforth associated with the Free Church. In 1847 he began the

greatest work of his life by the publication of his first *Plea for Ragged Schools*. This pamphlet, amid a multitude of other encomiums, elicited a beautiful and sympathetic letter from Lord Jeffrey. A ragged school was opened on the Castle Hill, which has been the parent of many similar institutions elsewhere. Guthrie insisted on bringing up all the children in his school as Protestants; and he thus made his ragged schools not only educational but proselytizing institutions. This interference with religious liberty led to some controversy; and ultimately those who differed from Guthrie founded the United Industrial School, which is managed on the principle of combined secular and separate religious instruction. In April 1847 the degree of D.D. was conferred on Guthrie by the university of Edinburgh; and in 1850 Dr Hanna, the biographer of Dr Chalmers, was inducted as his colleague in Free St John's Church.

In 1850 Guthrie published *A Plea on behalf of Drunkards and against Drunkenness*, which was followed by *The Gospel in Ezekiel* (1855); *The City, its Sins and Sorrows* (1857); *Christ and the Inheritance of the Saints* (1858); *Seedtime and Harvest of Ragged Schools* (1860), consisting of his three *Pleas for Ragged Schools*; and *The Way to Life and Speaking to the Heart* (1862). These works had an enormous sale, and carried his fame to distant parts of the world. Portions of them were translated into French and Dutch. In 1862 he was moderator of the Free Church General Assembly; but he seldom took a prominent part in the business of the Church courts. In connexion with the total abstinence movement he often appeared on the platform, where his oratorical talents, rich humour, genuine pathos, and inimitable power of story-telling eminently qualified him to shine. He was also greatly interested in the work of the Evangelical Alliance, of which he was one of the vice-presidents. In 1864, his health being seriously impaired, he resigned public work as pastor of Free St John's (May 17), although his nominal connexion with the congregation ceased only with his death. Guthrie had occasionally contributed papers to *Good Words*, and, about the time of his retirement from the ministry, he became editor of the *Sunday Magazine*, himself contributing several series of papers which were afterwards published separately. In 1865 he was presented with £5000 as a mark of appreciation from the public. His closing years were spent mostly in retirement; and after an illness of several months' duration he died at St Leonard's-on-Sea, February 24, 1873.

Dr Guthrie's fame rests on his labours as a social reformer and his extraordinary oratorical power as a preacher and platform speaker. He will always be remembered as one of the most successful and warm-hearted of Christian philanthropists; and his influence over the masses of his countrymen was very great. His theology was the moderate Calvinism generally accepted by the Evangelical school. His style is distinguished by great graphic power and richness of illustration; but, although admirably adapted for effect on a popular audience, it is far too florid and Asiatic in its rhetoric to please a sound literary critic.

See *Autobiography of Thomas Guthrie, D.D., and Memoir* by his sons, 2 vols., London, 1874-5.

GUTS MUTHS, JOHANN CHRISTOPH FRIEDRICH (1759-1839), a German teacher and the principal founder of the German school system of gymnastics, was born at Quedlinburg 9th August 1759. He was educated at the gymnasium of his native town and at Halle university; and in 1785 he went to Schnepfenthal, where he taught geography and gymnastics in Salzmann's academy. His method of teaching gymnastics was expounded by him in various handbooks; and it was chiefly through them that gymnastics very soon came to occupy such an important position in

the school system of Germany. He also did much to introduce a better method of instruction in geography. He died May 21, 1839.

His principal works are *Gymnastik für die Jugend*, 1793; *Spiele zur Uebung und Erholung des Körpers und Geistes für die Jugend*, 1796; *Turnbuch*, 1817; *Handbuch der Geographie*, 1810; and a number of books constituting a *Bibliothek für Pädagogik, Schulwesen, und die gesammte pädagogische Literatur Deutschlands*. He also contributed to the *Vollständiges Handbuch der neuesten Erdbeschreibung*, and along with Jacobi published *Deutsches Land und deutsches Volk*, the first part, *Deutsches Land*, being written by him.

GUTTA PERCHA (**GUTTA TABAN**, &c.). This name¹ is applied to the concreted or inspissated juice of various plants belonging to the natural order *Sapotaceæ*, growing in the Malay Peninsula. To what particular tree the name "gutta percha" properly belongs, there is no evidence to show; but it has been generally given to *Dichopsis Gutta* (Bentley and Trimen) or *Isonandru Gutta* (Hooker), the vernacular name of which is "taban."²

The *Dichopsis Gutta* attains a height of 60 to 80 feet, with a diameter of 2 to 4 feet. The leaves are obovate-oblong and entire, pale green on the upper side, and covered beneath with short reddish-brown shining down. The flowers are arranged in clusters of 3 or 4 in the axils of the leaves. The fruit, about an inch long, is of an ovoid shape, and is eaten by the Malays. In Siak (Sumatra) a vegetable butter is prepared from the seeds. The wood is soft, fibrous, spongy, of a pale colour, and marked with black lines, these being reservoirs of gutta percha.³ The gutta, as it flows from the tree, is of a greyish hue, occasionally with a somewhat roseate tinge, probably arising from the colour vessels of the bark becoming ruptured through surcharge, and their contents mixing with the gutta. This species does not furnish all the gutta percha of commerce; indeed there are other trees which yield larger quantities. In all there are about thirty varieties known; but some of the vernacular names in different districts may prove mere synonyms.

The geographical distribution of the trees producing gutta percha is very restricted. Gützlaff defines the limits as 6° N. and S. lat. and 100° to 120° E. long; whilst Captain Lingard (who has great personal experience on the subject) gives the limits as 4° N. and 3° S. lat., still further restricting the finer varieties to 3° 50' N. and 1° S., with a temperature ranging between 66° and 90° Fahr., and a very moist atmosphere. These limits are well within the isotherm of 80° Fahr. Many of the best varieties are found only on the hill slopes at a distance from the sea-coast, each variety forming a separate grove of from 200 to 500 trees, with high forest trees above them. They grow best in a rich light loam, with a rocky subsoil.

The collection of gutta percha generally takes place directly after the rainy season, as in the dry season the gutta does not flow so readily, while during the rains ague and jungle fever are most prevalent, and the gutta is liable to be washed away from the felled trees. The yield of a well-grown tree of the best variety is from 2 to 3 lb of gutta percha, such a tree being about thirty years old, 30 to 40 feet high, and 1½ to 3 feet in circumference. A full-grown tree sometimes measures 100 to 140 feet to its first branches,

¹ Gutta, or as it is variously written gutah, gatta, gittah, gatta, is the Malayán term for gum, and Percha (pronounced as in perch, not hard as perka), accentuated variously as pàrcha, pertja, perchá, is the name of the tree; hence the term may be translated "gum of the percha tree." The old name of Sumatra was Pulo or Pulau Percha, i.e., "Island (Pulau) of the percha tree."

² Taban, túban, tábán is the name of the tree, and, according to Logan, a new word has been added to the Malay language, viz., Menábán (Men[taban], i.e., to collect gutta taban. The greater number of Malay nouns admit of conversion into verbs by a prefix.

³ For figures and botanical descriptions see *Lond. Journ. Bot.*, 1843; De Vriese, *De Handel in Getah-Percha*; and Bentley and Trimen's *Medicinal Plants*, part 35, p. 16 (1878).

with a girth of 20 feet at a distance of 14 feet from the base, and may yield 50 to 60 lb of gutta percha, which loses in six months about 35 per cent. of its weight in drying.

The methods of extracting the gutta percha are much the same amongst the Malays, Chinese, and Dyaks. The trees are cut down just above the buttresses, or *banees*, as they are called; and for this purpose a staging about 14 to 16 feet high is erected. The tools used in felling are either "billiengs" or "parangs." A billieng is a kind of axe used by the Malays in felling, building, &c. The blade is of a chisel-like form, and the tang is secured at right angles to a handle by means of a lashing of "ratan" or cane. The Chinese sometimes use an axe perfectly wedge-shaped. The parang looks more like a sword-bayonet, and in the hands of a Malay is a box of tools in itself, as with it he can cut up his food, fell a tree, build a house, or defend himself.

When the tree is felled the branches are speedily lopped off, to prevent the ascent of the gutta to the leaves. Narrow strips of bark, about an inch broad and 6 inches apart, are then removed, but not all round the tree, as its underpart in its fall becomes buried in the soft earth, much sap being thus lost. Some natives beat the bark with mallets to accelerate the flow of milk or gutta. The milk flows slowly (changing colour the while) and rapidly concretes, and, according to its source, may vary from yellowish-white to reddish or even brownish in hue. The gutta as it flows is received into hollow bamboos, doubled-up leaves, spathes of palms, pieces of bark, cocoa-nut shells, or in holes scraped in the ground. If the quantity obtained is small, it is prepared on the spot by rubbing it together in the hands into a block, in one end of which a hole is made to carry it by. In this state it is known in the market as "raw gutta" or "gutta muntah." If water gets mixed with the juice, the gutta becomes stringy and is considered deteriorated, but after boiling appears quite as good. Sometimes the gutta is kept in a raw state for a month or two, and then undergoes the next step in the preparation, that is, boiling. The boiling is generally conducted in a "kwali" or pan of cast or hammered iron, of about 15 inches in diameter and 6 inches deep. The boiling is either simply with water, or with the addition of lime juice or cocoa-nut oil. If one pint of lime juice be added to three gallons of gutta juice, the latter coagulates immediately on ebullition.

On arriving at the port of shipment the gutta, before exportation, generally undergoes examination and classification into parcels, according to quality. As received in the "godowns" or warehouses it presents great diversities in condition, shape, size, and colour,—from crumbling, hardly coherent, whitish or greyish "raw" or "getah muntah" fragments, to reddish or brownish blocks as hard as wood. Sometimes it is made up into all manner of grotesque shapes of animals, and it is nearly always largely adulterated with sago-flour, sawdust, clay, stones, &c. The Chinese are great adepts in assorting and classifying gutta, and frequently prepare from different varieties a certain "standard sample" by cutting or chopping the material into thin slices and boiling with water in large shallow iron pans, keeping the contents constantly stirred with poles, and adding good gutta percha and even cocoa-nut oil to give a better appearance. When sufficiently boiled the gutta is pressed into large moulds, and is then ready for shipment. This process of reboiling is wholly unnecessary, and in some cases is done only to get rid of stuff which has no right to be called "gutta percha."

The amount and value of gutta percha imported into Great Britain in 1875-77 were as follows:—

	1875.	1876.	1877.
Cwts.	19,686	21,558	26,359
Value. ...	£149,684	£163,441	£238,327

The price of gutta percha ranges from 4d. to 3s. per lb, according to quality and demand.

History.—The early history of the use of gutta percha is somewhat obscure; the Malays and Chinese are said to have long known and used it. One of the earliest notices of it in England occurs in a catalogue of the collection of the famous Tradescants.¹ Dr Montgomerie, a surgeon in the East India Company's service, was the first to direct attention to gutta percha as likely to prove of great utility in the arts and manufactures. Having observed the substance in Singapore in 1822 in the form of whips, he commenced experimenting with it. In 1842, being again stationed at Singapore, he followed up the subject, and his recommendation of it to the medical board of Calcutta as useful for making of splints and other surgical apparatus met with high approval. He also sent specimens, with relative information, to the Society of Arts of London, which society warmly took up the subject, and on Montgomerie's return to England in 1844 presented him with its gold medal. Some have claimed the honour of introducing gutta percha to the notice of the commercial world for Dr (afterwards Sir) José D'Almeida, who sent a specimen merely as a curiosity to the Royal Asiatic Society in 1843, but careful investigation clearly decides the question of priority in favour of Montgomerie. The Society of Arts having requested him to lay before them the result of his experiments, he delivered a lecture in the autumn of 1844, and many patents were at once taken out, the chief being those of Mr C. Hancock, Mr Nickels, Mr Keene, Messrs Barlow and Forster, Mr E. W. Siemens, and others. After this the substance soon came into general use.²

Properties.—Gutta percha, like many other milky juices, occurs in the laticiferous tissue of the plant, which exists in greatest abundance in the middle layer of the bark. See BOTANY vol. iv. p. 87.

Gutta percha is resolvable into two resins, *albin* and *fluavil*. Like caoutchouc or india rubber, it is a hydrocarbon; Soubeiran gives its composition as—carbon 87·80 and hydrogen 12·20. In commercial gutta percha we have this hydrocarbon or pure gutta, plus a soft resin, a resultant of oxidation of the hydrocarbon. M. Payen gives the following analysis of commercial gutta percha:—

Pure gutta (milk-white in colour and fusible). 75 to 82 per cent.

Resins soluble in boiling alcohol:—

1. Crystallin or albin ($C_{20}H_{32}O_2$), white, and crystallizing out of the alcohol as it cools, 6 to 14 per cent.
2. Fluavil ($C_{20}H_{32}O$), yellow, falling as an amorphous powder on the cooling of the alcohol, 6 to 14 per cent.

It is thus apparent that the change of pure gutta into a resin-like mass takes place naturally if means be not taken to stop it. Many a good parcel has been thus lost to commerce, and the only remedy seems to be thorough boiling as soon after collecting as possible. It must be remembered too that, in cutting through the bark to arrive at the laticiferous vessels, many other vessels and cells become ruptured, containing tannic and gallic acids, &c., and the presence of these no doubt accelerates oxidation. In opening bottles of the milky juice a turbidity and effervescence are often noticed, owing to the formation of a brownish liquid, the colour being probably due to the presence of gallic acid. In improperly prepared blocks of gutta also, these foreign substances induce the presence of a brown fermented and putrid liquid, which decomposes the interal mass. Many of these substances, being soluble in water, are removable by the process of boiling.

Gutta percha as met with in commerce is of a reddish or yellowish hue, but when quite pure is of a greyish-white colour. In this

¹ In the *Museum Tradescantianum*; or, a *Collection of Rarities preserved at South Lambeth, near London, by John Tradescant*, . . . London, MDCLVI., the following entry occurs (p. 44):—"VIII. Variety of Rarities.—The plyable mazer wood, being warmed, will work to any form." This museum became the nucleus of the Ashmolean Museum at Oxford. The word "mazer," variously spelt, often occurs in early English poetry, and is specially mentioned in old catalogues and wills. It is by no means impossible that mazer cups may have been made of gutta percha, as its lightness, strength, and non-liability to fracture would recommend it; and curiously enough one of the vernacular names of the tree yielding gutta percha is "mazer wood tree."

² See Collins on "Gutta Percha" in *British Manufacturing Industries* (Stanford & Co.), and the very interesting volume of *Specifications of Patents in Caoutchouc, Gutta Percha, &c.* issued by the Patent Office.

state it is nearly as hard as wood, only just receiving the impression of the nail, is of a porous structure, and when viewed under the microscope has the appearance of a series of variously hued prisms. When moulded, rolled into sheets, or drawn into ropes, it assumes a fibrous character in the direction of its greatest length, in which direction consequently it can be stretched without rupture. If, however, a strip of a sheet be cut off across the fibre, it will be found that a redistribution of the tenacity of the slip takes place; *i.e.*, the direction of the fibrous character is developed in an opposite direction. The electrical properties of gutta percha were first noticed by Faraday. If a piece be subjected to friction, an electric spark can be obtained. On its relative electric conductivity, see vol. viii. p. 53.

At a temperature of 32° to 77° Fahr., gutta percha has as much tenacity as thick leather, though inelastic and less flexible. In water at 110° Fahr. it becomes less hard; towards 120° Fahr. it becomes doughy, though still tough; and at from 145° to 150° it grows soft and pliable, allowing readily of being rolled and moulded. In this state it has all the elasticity of caoutchouc, but this it loses as it cools, gradually becoming hard and rigid again, and retaining any form impressed on it whilst in its plastic condition. It is highly inflammable, and burns with a bright flame, dropping a black residue like sealing wax. The specific gravity of gutta percha has been variously stated at from 0.96285 to 0.99923. It is insoluble in water, alcohol, dilute acids, and alkalies, but dissolves in warm oil of turpentine, bisulphide of carbon, coal tar oil, caoutchouc or oil of caoutchouc, and its own oil,—for it yields by destructive distillation an oil similar to that yielded by caoutchouc under the same treatment. Ether and some of the essential oils render it pasty, and it is softened by hot water, absorbing a small quantity of the water, which is slowly parted with in cooling.

Manufacture and Applications.—Gutta percha, as received in England, is in irregular clumps or blocks, and is frequently adulterated with massive stones, sawdust, bark, sago flour, and other foreign matters; and the first step in its manufacture is to cleanse it thoroughly. The blocks are first sliced by means of a powerful circular wheel driven by machinery, and having fixed in it two or three strong chisel-like knives, by which it is divided into thin slices. These are placed in wooden troughs filled with water and heated by steam. As soon as the gutta percha becomes soft, it is taken out in baskets and placed in a toothed iron cylinder, called a “deviling” machine, which tears it into fragments; these fall into a trough of water, and the impurities sink to the bottom, leaving the purified gutta floating in the form of a spongy mass. This mass is then taken out by means of perforated shovels, thoroughly washed in cold water, and dried in baskets. It is then packed in jacketed iron chests heated by steam, and left till it becomes soft, when it is at once removed, and kneaded or masticated by means of a cast-iron cylinder, with a movable lid and an internal revolving toothed iron axis,—the result being a homogeneous dough-like reddish-brown mass. Sometimes various substances are introduced into this machine, which is called a “masticator,” to increase the hardness or density of the gutta, or to colour it,—such as orange or red lead, chrome, vermilion, yellow ochre, sulphur, caoutchouc, gypsum, or resin, care being taken to use such substances only as are not affected by the heat necessary in the operation. The incorporation is conducted with great nicety, as at the will of the operator a soft and elastic or a hard and horny substance can be produced. When sufficiently masticated, the gutta is placed whilst still hot between two steel cylinders, and thoroughly rolled. By means of an endless band of felt the gutta is returned again to the cylinders, the distance between which is gradually diminished so as to compress and completely drive out any contained air from the gutta percha. There are various machines for cutting driving bands, &c., to a uniform width, and for rounding off the edges and finishing. Soles for boots are made by cutting a long strip of the requisite width, and then passing the strip under a hollow die.

In making piping a machine is used consisting of a cylinder, with a die-piece attached of the requisite size. By means of a piston the gutta percha, which is introduced into the cylinder in a plastic condition, is driven through the die-piece, and the piston gives the inner diameter of the piping. As the piping issues from the machine, it passes immediately into a trough of water, which “sets” it, and prevents it from collapsing. The value of gutta percha piping is very great: it does not contaminate water as lead piping does; it withstands insects, damp, &c., and is easily manipulated, being shortened, lengthened, or repaired without trouble or expense; and its acoustic properties have led to its employment largely in the manufacture of aural, stethoscopic, and other instruments. Gutta percha speaking-tubes are now to be seen in nearly every office. The substance too, from the fact that few acids and alkalies affect it, especially if dilute, is largely employed for funnels, siphons, and other chemical apparatus.

In telegraphy gutta percha is of the very highest importance, being a cheap, lasting, and powerful insulator, easily applied to telegraphic wires. The general method of coating telegraphic wire is by charging a cylinder with plastic gutta percha, and forcing it through a die-piece, the wire forming a central core. As the wire

is drawn through this “die” or “moulding” piece, it becomes coated to the requisite thickness, and after passing through water it is wound on drums ready to be coated with tarred rope, and with galvanized iron wire if required for submarine cables.

The readiness with which gutta percha, whilst in its plastic condition, receives an impression, which it retains when cold, early led to its employment in the decorative and fine arts, since it reproduces the finest lines, as in the taking of moulds from electrotypes. See ELECTROMETALLURGY.

In the production of imitations of oak and other ornamental woods, gutta percha has been largely used, since by the admixture of various substances “graining” or “marbling” can be very naturally represented, and a coating of a solution of gutta percha gives a varnish of great brilliancy.

Substitutes.—Many substances have been recommended as substitutes for, or as supplementary to, gutta percha. Among these Balata gum undoubtedly holds the first place. It is obtained from the *Monosops Balata* (Gartner), a tree found in British and French Guiana, Jamaica, &c. Prof. Bleekrod seems to have been the first to direct attention to this substance, by bringing it before the notice of the Society of Arts in 1857.¹ The Balata gum combines in some degree the elasticity of caoutchouc with the ductility of gutta percha, freely softening and becoming plastic, and being easily moulded like gutta percha. What small parcels have been sent to England have met with a ready sale, and were remarkably pure and free from adulteration. But unfortunately, through the difficulty of collection, the occupation being dangerous and unhealthy, the supply of this excellent article has fallen off. It is procured by making incisions in the bark of the tree about 7 feet from the ground, a ring of clay being placed around to catch the milk as it exudes. A large tree is said to yield as much as 45 lb of “dry gum.”² *Pauchontce*, the produce of *Dichopsis elliptica*, Collins (*Bassia elliptica*, Dalzell), is a most interesting substance, and may yet prove an article of commerce if properly treated; at present, although by heat it becomes plastic and ductile, it is brittle and resin-like when cold. The tree is found very generally distributed in Wynaad, Coorg, Travancore, &c.

Many of the euphorbias yield milky juices which have some at least of the properties of gutta percha. The chief amongst these are the cattimandoo (*Euphorbia Cattimandoo*, Elliot) and the Indian spurge tree (*E. Tirucalli*, Linn.) of India, and some euphorbias at the Cape of Good Hope. The alstonia or pala gum (*Alstonia scholaris*, R. Br.) and the mudar gum (*Calatropis gigantea*, R. Br.), have also been recommended as substitutes for gutta percha. But the attempts made to utilize these substances have as yet been unsuccessful.

Future Supplies.—A very important matter for consideration is the question of the future supplies of gutta percha. It is after all only a spontaneous natural product. If a Malay or Chinese wishes to plant pepper, gambier, &c., he burns down a portion of the forest, and when he has raised two or three crops he clears a new portion, and thus finely wooded spots become denuded of trees, and covered with rank grass rendering them unfit for further cultivation. Again, to obtain the gutta percha the trees are cut down, and none are planted in their stead, so that in districts where they were in abundance one or two only are now preserved as curiosities. It is a wonder indeed that a single tree is left. A writer in the *Sarawak Gazette* says that from 1854 to 1875 over 90,000 piculs (of 133½ lb each) of gutta percha was exported from Sarawak alone, and this meant the death of at least 3,000,000 trees. In fact the only thing that preserves the tree at all is that it is of no use to cut one down till it is 25 to 30 years old. Sooner or later recourse must be had to cultivation and conservation. (J. CO.)

GUTZKOW, KARL (1811–1878), one of the most distinguished of modern German novelists and dramatists, was born 17th March 1811 at Berlin, where his father held a clerkship in the war office. After completing his education at the Friedrichswerder gymnasium, he entered upon the study of theology and philosophy at the university of his native town, where, having had his interest awakened by the political and social questions of the time by the Paris revolution of July 1830, he, while still a student, began his chequered literary career by the publication in 1831 of a periodical entitled *Forum der Journalliteratur*. Although, as was to be expected, the serial was a failure and was soon discontinued, it procured for him the notice of Wolfgang Meuzel, who invited him to Stuttgart to assist him in the editorship of the *Literaturblatt*. At the same time he continued his university studies, first at Jena, then at Heidelberg, and latterly at Munich. In 1832 he published anonymously at Hamburg *Briefe eines Narren an eine*

¹ *Journ. Soc. Arts*, Oct. 8, 1857; also Aug. 24, 1860, and March 4, 1864.

² *Trinidad Chronicle*, Sept. 2, 1873.

Närrin, and in 1833 appeared at Stuttgart *Maha-Guru, Geschichte eines Gottes*, a fantastic and satirical romance intended to ridicule the current conceptions of the divine. In 1835, on account of a difference with Menzel, he discontinued his contributions to the *Literaturblatt*, and went to Frankfort, where he became collaborateur with Duller on the *Phoenix*, and also founded the *Deutsche Revue*. In the same year appeared *Wally, die Zweiflerin*, from the publication of which may be said to date the school of writers who, from their opposition not only to Romanticism but to all the time-honoured literary, social, and religious traditions, have received the name of "Young Germany." The work was directed specially against the institution of marriage and the belief in revelation; and whatever attention it might have attracted from its own merits was tenfold increased by the action of the Government, which, besides condemning its author to three months' imprisonment, decreed the suppression of all he had written or might yet write, and prohibited him from exercising the functions of editor within the states of the *Bund*. During his term of imprisonment Gutzkow employed himself in the composition of his treatise *Zur philosophie der Geschichte*, published at Hamburg in 1836, in which he opposed the Hegelian theory as to the nature and ends of history. On obtaining his freedom he went to Frankfort, where, shortly afterwards, he was married, and where he wrote several volumes on various subjects which he published at Hamburg and Stuttgart; but finding himself hampered in his literary undertakings by the prohibitions of the Prussian Government, he removed in 1837 to Hamburg. Here he inaugurated a new epoch of his literary activity by bringing out his tragedy *Richard Savage*, which immediately made the round of all the German theatres, and first decidedly won the ear of Germany for the modern drama. Of his numerous other plays the majority are now neglected; but a few have obtained an established place in the repertory of the German theatre,—especially the comedies *Zopf und Schwert* (1844) and *Das Urbild des Tartüffe* (1847), and the tragedy *Uriel Acosta* (1847); the deep tragic interest, fine dramatic situations, and terse and pregnant diction of the last entitle it to rank among the best dramas of modern times. In 1842 Gutzkow paid a visit to Paris, of which he gave an account in *Briefe aus Paris* (Leipsic, 1842). After his return to Germany he resumed his stay at Frankfort, where he was chiefly occupied in preparing for the press an edition of his collected works, published in 12 volumes, 1845-46; but in 1847 he went to Dresden, where he succeeded Tieck as director of the court theatre. About the same time began that period of his literary activity to which belongs the series of remarkable works of fiction intended to depict the action and tendency of the principal intellectual, social, and religious forces in modern society. The chief of these novels are *Die Ritter vom Geiste* (9 vols., Leipsic, 1850-52) and *Der Zauberer von Rom* (9 vols., Leipsic, 1859-61). The latter, a study of Roman Catholic life in southern Germany, is generally regarded as his masterpiece; and its vigorous and trenchant delineations of character are not more notable than its keen analysis of the motives underlying religious professions, and its subtle penetration into the characteristics and tendencies of the various forms of religious opinion. In regard, however, to both works, it may be objected that their great length, their somewhat tedious dallying over unimportant details, the intricate nature of their plots, and the hampering influence of their controversial purpose lessen considerably the legitimate effect of their many striking and original character portraits, their skilfully arranged dialogues and frequently powerfully dramatic scenes, and the cunning manner in which their incidents are blended into one whole. The success of *Die Ritter vom Geiste* suggested to Gutzkow the establishment

of a journal on the model of Dickens's *Household Words*, entitled *Unterhaltungen am häuslichen Herd*, which first appeared in 1852, and was continued till 1862. In 1864 he had an attack of insanity, during which he made an attempt upon his life; and although after his recovery he continued to write as voluminously as formerly, his productions show henceforth decided traces of failing powers. To this period belong the historical novels *Hohenschwangau* (5 vols. 1868) and *Fritz Ellrodt* (3 vols. 1872); *Lebenbilder* (3 vols. 1870-72), consisting of autobiographic sketches; and *Die Söhne Pestalozzis* (3 vols. 1870), the plot of which is founded on the story of Kaspar Hauser. On account of a return of his nervous malady, Gutzkow in 1873 made a journey to Italy, and on his return took up his residence in the country near Heidelberg. Although some time before his death he had been confined to his sick chamber at Frankfort, its occurrence, 16th December 1878, was due to accidental suffocation from smoke.

The writings of Gutzkow suffer in character from the controversy which embittered his life. His didactic purpose was too strong to allow his fine artistic faculty full freedom of action, and notwithstanding his true dramatic insight, firm grasp of character, rich vein of original thought, and wonderful comprehension of the principles at work in modern society, he did not possess that command of his materials which is necessary to mould them into poetic completeness. But although his popularity has not been commensurate even with his merits, no recent writer has exerted a more powerful influence on the opinions of modern Germany; and if his works are not destined to live by virtue of their inherent value, many of them will always be of interest as the mirror in which the intellectual and social struggles of his time are best reflected.

An edition of Gutzkow's collected works appeared at Jena, 1873-76. Since his death the issue of a popular edition has been undertaken, the first volume of which, containing the autobiography of his boyhood and his miscellaneous poems, has already appeared. His *Rückblicke auf mein Leben*, published in 1875, deals specially with that period of his life when he was director of the Dresden theatre. A complete biography by Johannes Proch is now in process of preparation.

GÜTZLAFF, KARL FRIEDRICH AUGUST (1803-1851), a missionary to China, was born at Pyritz in Pomerania, 8th July 1803. At an early age he cherished a strong desire to become a foreign missionary, but the poverty of his parents made it impossible for them to aid him in attaining his wishes, and he became apprentice to a saddler in Stettin. In 1821, however, he made known his inclination to the king of Prussia, through whom he obtained admission to the Pädagogium at Halle, and afterwards to the mission institute of Jänike in Berlin. In 1826, under the auspices of the Netherlands Missionary Society, he went to Batavia, where by intercourse with the Chinese residents he perfected himself in the Chinese language. He, however, severed his connexion with the Netherlands Society in 1828, and went to Singapore; and in August of the same year he removed to Bangkok, the capital of Siam, where he occupied himself with translating the Bible into Siamese. In 1829 he married an English lady, who aided him in the preparation of a dictionary of Cochin China, but she died in August 1831 before its completion. Shortly after her death he sailed to Macao in China, where, and subsequently at Hong Kong, he worked at a translation of the Bible into Chinese, published a Chinese monthly magazine, and wrote in Chinese various books on subjects of useful knowledge. He also at different times undertook voyages on the coast of China, and in 1834 he published at London an account of them under the title *Journal of Three Voyages along the Coast of China* in 1831, 1832, and 1833. He was appointed in 1835 joint Chinese secretary to the English commission, and during the opium war and the negotiations

connected with the peace that followed he rendered valuable service by his knowledge of the country and people. On account of the continued refusal of the Chinese authorities to permit foreigners to penetrate into the interior, Gützlaff in 1844 founded an institute for the training of native missionaries, which was so successful that during the first four years as many as forty-eight Chinese were sent out from it to carry on missionary labours among their fellow-countrymen. He died at Hong Kong, August 9, 1851.

Besides the works already mentioned, Gützlaff is the author of *A Sketch of Chinese History, Ancient and Modern*, London, 1834; and a similar work published in German at Stuttgart in 1847; *China Opened*, 1838; and the *Life of Taow-Kwang*, 1851 (German edition published at Leipzig in 1852). A complete collection of his Chinese writings is contained in the library at Munich.

GUY, THOMAS (1644–1724), founder of Guy's Hospital, London, was the son of a lighterman and coal-dealer at Southwark. After serving an apprenticeship of eight years with a bookseller, he in 1668 began business on his own account. He dealt largely in Bibles, which had for many years been poorly and incorrectly printed in England. These he at first imported from Holland, but subsequently obtained from the university of Oxford the privilege of printing. Thus, and by an extremely thrifty mode of life, and more particularly by investment in Government securities, the subscription of these into the South Sea Company, and the subsequent sale of his stock in 1720, he became master of an immense fortune. He died unmarried, December 17, 1724. In 1707 he built three wards of St Thomas's Hospital, which institution he otherwise subsequently benefited; and at a cost of £18,793, 16s. he erected Guy's Hospital, leaving for its endowment £219,499; he also endowed Christ's Hospital with £400 a year, and in 1705 built almshouses at Tamworth, his mother's birthplace, which was represented by him in parliament. The residue of his estate, which went to distant relatives, amounted to about £80,000.

See *A True Copy of the Last Will and Testament of Thomas Guy, Esq.*, London, 1725; J. Noorthouck, *A New Hist. of London*, bk. iii., chap. i., p. 634, 1773; Nichols, *Literary Anecdotes*, vol. iii. p. 599, 1812; and Charles Knight, *Shadows of the Old Booksellers*, pp. 3–23, 1865.

GUY OF WARWICK, an old English metrical romance which is known to have existed in French as early as the end of the 13th century. Its authorship has been assigned to Walter of Exeter, a Franciscan monk of the 13th century, and, although this supposition has been generally disputed, Tanner regards it as probable. The romance has been retouched by some French or Anglo-Norman minstrel, but is evidently of Saxon origin, and is allied to the story of Guido Tyrius in the *Gesta Romanorum*, and probably to the romance *Sir Guy*, quoted by Chaucer in his *Rime of Sir Topas*. The hero of the story is Sir Guy of Warwick, who is said to have been the son of Siward, baron of Wallingford, to have married Felicia, the only daughter of Rohand, a famous Saxon warrior, to have become earl of Warwick in his wife's right, and after conquering Colbrond the Dane to have lived as a hermit till his death in 929. The earliest English chronicler who mentions the story as historical is John Harding. Tanner is of opinion that the first germ of the romance dates from the battle of Brunanburgh, the "Vinhede" of the *Egilssaga*, but though the story has some basis in tradition, the chief events of the hero's life are plainly mythical. Although the romance had once great popularity, it now appears dull and tedious, and has no other than an antiquarian interest.

An edition of the romance in French prose appeared at Paris in 1525 printed by Anthoine Cousteau, and it is also referred to in the Old Spanish romance, *Terente el Blanco*, written about 1430. The earliest English edition is that without date printed at London by William Copland, who died in 1568 or 1569. There exist also an edition printed at London by John Cawood without date, another by Samuel Rowlands in 1667, and three by C. Bates in 1700. The

earliest English manuscript of the romance is that contained in the Auchinleck MS. in the Advocates' Library, Edinburgh, which is, however, imperfect at the commencement and in the middle. It was printed for the Abbotsford Club in 1840. There is a perfect copy in the library of Caius College, Cambridge, and another in the Cambridge University Library. A fragment of the romance, from a MS. in the British Museum, was privately printed by Sir Thomas Phillipps, 1838, and the same fragment was reprinted in the Abbotsford edition. The manuscript in the University Library, Cambridge, was printed for the first time in the *Romance of Guy of Warwick*, edited for the early English Text Society by Zupitza, 1875. All these English versions appear to have been translated from the Anglo-French version. There are, according to Zupitza, at least eight French MSS. in existence,—three in London, one at Oxford, two at Cambridge, one at Cheltenham, and one at Wolfenbüttel. There is also a copy in the Imperial Library of Paris; and there was one at Bruges in 1467, and one at Brussels in 1487. A portion of the Wolfenbüttel MS. has been edited by G. A. Herbing in the *Programm der grossen Stadtschule zu Wismar als Einladung zur Michaelisprüfung*, 1872. See also Zupitza, *Zur Literaturgeschichte von Guy von Warwick*, 1813; *The Percy Folio MS.*, edited by Hales and Furnivall, vol. ii.; and A. Tanner, *Die Sage von Guy von Warwick*, 1877.

GUYON, or GUION, JEANNE MARIE BOUVIÈRES DE LA MOTHE (1648–1717), a leading exponent of the quietistic mysticism of the 17th century, was born of wealthy and aristocratic parents at Montargis (dep. Loiret), on the 13th of April 1648. From infancy a sickly and excitable child, she was at the age of two years and a half placed for a short time under the charge of the Ursuline nuns of Montargis, and in 1652 she became resident in the Benedictine convent for a somewhat longer period; but the state of her health rendered it necessary that she should again be taken home, where for a time she was left almost exclusively to the care of domestics. From her seventh to her tenth year she was once more with the Ursulines, and after another short interval at home she next passed eight months in the Dominican cloister, where she spent much time in reading the Bible, and in committing large portions of it to memory. In her 12th year she communicated for the first time, and also began to form some acquaintance with the writings of St Francis de Sales and of his disciple Madame de Chantal, "la Sainte de Monthélon." In imitation of the latter, she tells us in her autobiography that she at this time carried the name of the Saviour visibly inscribed on her person, subjected herself to severe bodily austerities, and made a solemn vow ever to aim at the highest perfection in an absolute surrender of her will to God. She earnestly wished also to take the veil, and in fact made an attempt, by means of a forged letter purporting to be signed by her mother, to gain admission into the order of the Visitation of Mary, but her father interfered. In 1663 she removed along with her parents to Paris, and went much into society, where her youth, beauty, and talent secured for her a very flattering reception; in the following year, before she was quite sixteen, she was married to M. Guyon, a man of some wealth and position, but of weak health, and twenty-two years her senior. The union, on her side at least, had not been dictated by love; her husband's affection, though probably genuine enough, appears to have been of a somewhat tepid kind; and disparity of age, as well as wide differences of taste and habit between herself and M. Guyon, combined with other circumstances, such as the jealousy of her mother-in-law, and her own eager temper, to make her married life anything but happy. She "began to eat the bread of sorrow and to mingle her drink with tears," and her lonely and desolate heart was not comforted until it found quiet in God. It was in her twenty-first year, on the 22d of July 1668, she tells us, that, after much reading of Thomas a Kempis, St Francis de Sales, and other religious writers, much spiritual conversation with those who knew best about the mysteries of the "inner life" and the happiness of the state of "recollection in God," much groping in deep darkness, and much wrestling in agonized

prayer, she at last experienced the change of heart which filled her with joy and peace in the life of faith. The words in which she describes that crisis, if indeed they are not coloured by later experiences, are interesting and important, as showing that thus early she had already feasted all that was distinctive of her quietism. "Nothing was more easy to me now than to practise prayer. Hours passed away like moments, while I could hardly do anything else but pray. The fervency of my love allowed me no intermission. It was a prayer of rejoicing and of possession, wherein the taste of God was so great, so pure, unblended, and uninterrupted, that it drew and absorbed the powers of the soul into a profound recollection, a state of confiding and affectionate rest in God, existing without intellectual effort. For I had now no sight but of Jesus Christ alone. All else was excluded in order to love with greater purity and energy, without any motives or reasons for loving which were of a selfish nature." In the months and years that followed she learned by much experience how difficult it is to keep even such heights as the soul has already gained; but her aim, ever more clearly seen and more steadily followed, continued to be "entire consecration," "perfect faith and love." Amongst those who were helpful to her during this period was Geneviève Granger, the prioress of a Benedictine community in Paris, under whose influence she, on July 22 (St Mary Magdalene's day), 1672, drew up a solemn act of consecration, sealed with her ring and signed with her blood, in which she surrendered herself to Christ as His spouse, accepting as a part of her marriage portion "the temptations and sorrows, the crosses and the contempt, which fell to Him." In the beginning of 1674 she passed into a state of "privation" or "desolation," which she considers to have continued with but slight variations for somewhat more than six years; during the whole of this period, however, she had the benefit of the spiritual direction of Bertot, a kindred spirit, whose mystical writings she afterwards edited. On the 21st of July 1676 she was left a widow, with three surviving children,—two sons and an infant daughter,—and began to live a life of still deeper seclusion and isolation than before, interesting herself, however, in works of charity, and in the education of her family; in connexion with the latter occupation she commenced and made some progress in the study of Latin. Her temptations and crosses continued nevertheless to multiply; she began to lose hope, and to regard herself as wholly forsaken by God; in her deep despondency she began to correspond with Francis de la Combe, superior of the Barnabites at Thonon, Savoy, with whom she had ten years before become acquainted, and in whom she had even then recognized a sympathizing spirit. On the 22d of July 1680 she tells us her soul was delivered from all its pains. "From the time of the first letter from Father La Combe, I began to recover a new life. I was then, indeed, only like a dead person raised up, who is in the beginning of his restoration, and is raised up to a life of hope rather than of actual possession; but on this day I was restored, as it were, to perfect life and set wholly at liberty. I was no longer depressed, no longer borne down under the burden of sorrow. I had thought God lost, and lost for ever; but I found Him again. And He returned to me with unspeakable magnificence and purity. In a wonderful manner, difficult to explain, all that which had been taken from me was not only restored, but restored with increase and with new advantages." In this changed state of feeling she began to revolve new plans for the disposal of the remainder of her earthly life. She for some time thought of winding up her worldly affairs and taking the veil; but her duty towards her children, especially the two younger, seemed to prohibit that step. Several proposals of marriage were also received, but re-

jected. Gradually, in the course of 1681, she had almost, though with hesitation, reached the conclusion that she was called to active religious work, and the field to which inward intimations seemed to point was that part of France and Savoy which borders on Geneva, if not Geneva itself. The advice of D'Aranthon, titular bishop of Geneva, was asked and obtained; he approved of the proposal. After making some important arrangements with regard to her property, and entrusting her two sons to the care of suitable guardians, she accordingly secretly left Paris accompanied only by three female attendants and her daughter, then a child of five years of age. The party arrived at Annecy on the 21st of July; on the following day, at the tomb of St Francis de Sales, Madame Guyon renewed her spiritual marriage with the Redeemer; and finally she fixed her abode at Gex under the spiritual care of D'Aranthon, by whom La Combe was assigned to her as her director in the place of Bertot, who had died some time before. Here she at once began her benevolent labours, tending the sick and poor, praying with them and giving them religious instruction; yet still it seemed to her as if the "seal of her mission was not yet broken." Something within her whispered that she had not yet found the great and special work to which God had been calling her. Amongst other things the state of her director caused her much solicitude. She saw that he had much, but felt that he ought to have more. Her vocation at last was revealed to her, to become to him a spiritual mother, and her efforts towards the fulfilment of that vocation were not in vain; La Combe at last became possessed with the doctrine of present sanctification by faith in the Saviour, and began to preach accordingly. Opposition and persecution almost immediately began; Bishop D'Aranthon did not fail to take notice of the new doctrine, though on this occasion it escaped formal condemnation by the authorities at Rome; seeing, however, that Madame Guyon was the real author of the heresy, if heresy it was (and it certainly seemed to involve a theory of perfectionism hardly compatible with Catholicism), he resolved that she should not continue her activities within his diocese unless she should consent to accept a sphere where the facilities for doctrinal propagandism would be less than those for the exercise of ordinary benevolence. He accordingly proposed that she should give what property still remained within her control to a religious house at Gex, and that she should herself become prioress; this proposal, however, she declined, chiefly on the general ground that it did not seem to be in accordance with the designs of God in regard to her. The alienation of the bishop now made her stay at Gex to be far from comfortable; and accordingly, at the close of a residence of rather more than six months, she removed early in 1682 to Thonon, apparently in the expectation of being near her adviser La Combe. Here she remained for upwards of two years, engaged in religious work of various kinds, especially in spiritual conversation with the people of the neighbourhood, and in tending a small hospital which, at the suggestion of her director and with the assistance of some benevolent ladies of Thonon, she had formed. Meanwhile her doctrines of "pure love" and of that "fixed state" which consists in the complete identification of the human will with the will of God were taking more definite shape; and in 1683 they first found literary expression in *Les Torrens*, probably the best of her writings, and really in some respects a fine performance, which describes the progress of the soul from the commencement of its inward life to its union with God, by a reference to "streams or torrents flowing from the mountain tops with greater or less rapidity and with greater or less directness, and mingling at last in the ocean." Although Madame Guyon was not herself conscious of any disharmony with the teaching and practice of the Catholic Church, her

doctrines could hardly fail to be regarded by the ordinary orthodoxy of that time as more or less hostile to the generally accepted views as to the nature and mode of sanctification, and as to the normal state of the graciously renewed heart; at Thonon they soon gave deep offence, and ultimately it was intimated both to her and to La Combe, on the part of Bishop D'Aranthon, that both must leave the diocese. Her next resting place for a few weeks was Turin, whence, in the autumn of 1684, she removed to Grenoble, where she again became a centre of attraction and influence. Here, for the direction of the many who flocked to her for instruction and advice, she wrote and circulated her *Moyen court et très facile de faire oraison*, a treatise in which she pointed out, doubtless in a manner highly susceptible of misconstruction, that prayer might often well be both silent and wordless. The commencement of her commentaries on the Bible also dates from this stay in Grenoble. Her numerous and popular "conférences" or meetings for conversation and prayer or "self-recollection in God," and the effect produced by the *Moyen court de faire oraison*, however, speedily excited ecclesiastical opposition similar to that which she had already encountered at Gex, and although the bishop (Camus) was himself disposed to be tolerant, if not friendly, she was ultimately constrained, in the spring of 1686, to yield to strong representations, and seek an abode elsewhere. Nice, Genoa, and Vercelli (where she again met La Combe) were visited in turn; but it was finally resolved, with the advice and concurrence of her friends, that Paris now offered itself as the field of labour most suited to her powers. Here accordingly she arrived on the 22d of July 1686, and soon she and her teaching began to meet with a very favourable reception in the higher circles of society. But meanwhile the doctrine of Molinos and the *Guida Spirituale* had been formally condemned by the Inquisition at Rome, and the sentence had been taken up as a signal, especially in France, for the persecution of all suspected quietists. In October 1687 La Combe was suddenly arrested by a royal "lettre de cachet" and committed to the Bastille; and by the same authority Madame Guyon herself was, three months later (29th January 1688), ordered to be detained as a prisoner in the convent of St Marie in the Faubourg Sainte Antoine. The charges brought against her were the maintenance of heretical opinions; the holding of private religious assemblies, contrary to the practice and rules of the Catholic Church, for the spread of these opinions; the publication of a dangerous book containing opinions similar to those of the *Spiritual Guide* of Molinos; and correspondence with Molinos. These, however, were not destined to come to a definite issue, for through influence which friends succeeded in bringing to bear upon Madame de Maintenon a release was obtained in the following October. Madame Guyon now went to live for the most part with her daughter, who had become the Comtesse de Vaux, at the family seat in the neighbourhood of Paris; but while on a visit with the duchess of Charost she became acquainted with Fénelon, and a considerable correspondence began. Her influence continuing to make itself felt at Paris, Dijon, Versailles, and other places, especially in the institution of St Cyr, founded by Madame de Maintenon in 1686, the attention of theologians was drawn afresh to the "new spirituality," as it was called; and among others both the Port-Royalist Nicole and Bossuet, bishop of Meaux, sought personal interviews. The latter, to whom she had submitted not only all her printed works but also the manuscript of an autobiography which she had written when in confinement in 1688, after more than one long conference, is understood to have expressed himself as on the whole satisfied of her orthodoxy; but the publication by Nicole of the *Réfutation des principales Erreurs des Quietistes* appears to have had an exciting influence on the

public mind; rumours prejudicial not only to the orthodoxy of Madame Guyon's faith, but also to the purity of her life, were industriously spread, and caused great scandal in the highest quarters, so that at last she was constrained to write to Madame de Maintenon requesting that a number of suitable persons might be selected for the purpose of judging both of her doctrine and her morals, and offering at the same time to submit to any degree of confinement and restraint until it should please the king to appoint such persons. A commission was duly nominated, consisting of Bossuet, Bishop (afterwards Cardinal) De Noailles, and Tronson, the superior of St Sulpice. To this tribunal she at their request submitted the *Moyen Court, Les Torrens*, and the manuscripts of her commentaries along with her autobiography, to which she added her *Justification*. The outcome of many deliberations, extending over some months, was the preparation of twenty-four articles, usually called the "Articles of Issy," relating to the doctrine of "pure love." Her refusal to sign a "condemnation of religious errors," as drawn up and presented to her by Bossuet in a pastoral ordinance and letter, now led to an open rupture which resulted in her re-imprisonment, on this occasion at Vincennes, on the 27th of December 1695. Bossuet now set himself to prepare his *Instruction sur les états d'oraison*, which he submitted before publication to De Noailles, and, amongst others, to Fénelon for approval. The latter after reading the manuscript withheld his imprimatur, not on account of its doctrine (with which he did not disagree), but on account of its personalities, which he held to be uncalled for and unjust. Almost forced thus into the position of a champion of Madame Guyon, he published in 1697 his *Maximes des Saintes*, a statement of the leading principles laid down by approved writers on the subject of the higher inward experience and of holy living. In the course of the controversy which followed several important works appeared, which can only be alluded to here; the dispute, as is well known, issued in the formal condemnation of Fénelon (12th March 1699), in which achievement the hostility to Madame Guyon seems to have almost exhausted itself. She was not released, however, until 1702, in which year she was banished to Blois, where the remainder of her life was spent. Numbers of persons of all ranks, and many of them from foreign countries, visited her in this retirement; and both in correspondence and conversation she continued to manifest considerable activity, although feeling herself "called on to glorify God by submission and by private prayer, rather than by active labours." She heard mass daily, received the sacrament every alternate day, and died in full communion with the Roman Catholic Church, after an illness of three months, on the 9th of June 1717.

La Vie de Madame de la Mothe Guyon, écrite par elle-même, first appeared at Cologne in 1720. It is based upon the autobiography which at the instance of La Combe she is known to have written during her imprisonment in 1688; it afterwards received additions and corrections from her own hands, and was finally entrusted to a confidential friend on the understanding that it should not be published until after her death. In addition to *Les Torrens Spirituels*, and the *Moyen court et très facile de faire oraison*, which were published in the *Opuscules Spirituels* in 1704, there appeared in her lifetime the *Poésies Spirituelles* (1689); and *La Bible, traduite en français, avec des Explications et des Réflexions qui regardent la Vie Intérieure* (1715). There are also several volumes of *Lettres Chrétiennes et Spirituelles*, addressed by her to Metternich, Fénelon, and other correspondents, many of them distinguished. The edition of the collected *Œuvres* extends to 40 vols. (1767-1791). English and German translations of the various works are numerous. Apart from the *Autobiography*, the only memoir of Madame Guyon as yet in existence, is the diffuse but somewhat vague and meagre *Life*, by Thomas C. Upham (1854). (J. S. BL.)

GUYTON DE MORVEAU, LOUIS BERNARD, BAHON (1737-1816), a distinguished French chemist, was born January 4, 1737, at Dijon, in the university of which town his father was professor of civil law. As a boy,

he evinced a remarkable aptitude for practical mechanics. On leaving college at the age of sixteen he became a law student in the university of Dijon, and after three years he was sent to Paris to acquire a knowledge of practice at the bar. He obtained in his twenty-fourth year the office of advocate-general in the parliament of Dijon, of which he fulfilled the duties till 1782. Before long, piqued by a slighting remark of Dr Chardenon of Dijon, made in reply to a criticism at the close of a lecture on chemistry, De Morveau set himself to acquire a thorough knowledge of that science. With "practice for his master, and melted crucibles and retorts for tutors," as he once observed to Baumé, he speedily obtained such a mastery over his subject as to draw from Chardenon the public acknowledgment that he was "born to be an honour to chemistry." In 1772 he published at Dijon the *Digressions Académiques*, in which were set forth his views with respect to phlogiston and the phenomena of crystallization; and in 1773 he discovered the efficacy of hydrochloric acid gas as an atmospheric disinfectant.¹ He was the means, in 1774, of founding in Dijon courses of public lectures on mineralogy, materia medica, and chemistry, the last of which he himself during thirteen years gratuitously delivered. It would appear that his fellow-citizens were as yet far from holding exalted views with regard to the prerogatives of science. Accusing him of "presumptuously disarming the hand of the Supreme Being," they about this time sought to destroy his lightning conductors at the house of the academy, and were restrained from carrying out their intentions only by the assurance of M. Maret, the secretary of that institution, "that the astonishing virtue of the apparatus resided in the gilded point, which had purposely been sent from Rome by the Holy Father." In 1777-78 appeared the *Éléments de Chimie Théorique et Pratique* (3 vols. 12mo) of De Morveau, Maret, and Durande, a work highly appreciated by their contemporaries. The chemical articles in vol. i. of the section "Chymie, Pharmacie, et Metallurgie" of the *Encyclopédie Méthodique* (1786), as also some few of those of vol. ii. (1792), were from the pen of De Morveau. Of these the longest is a masterly exposition of the facts and conclusions that had up to that time been arrived at by chemists on the subject of acids.

De Morveau's first essay on a new chemical nomenclature, the origin of the present system, was published in the *Journal de Physique* for May 1782, and was the subject of much adverse criticism. Repairing to Paris, the author successfully met the objections of his opponents; and in 1787, in conjunction with Lavoisier, Berthollet, and Fourcroy, he published *Méthode d'une Nomenclature Chimique*, the principles of which were speedily adopted by chemists throughout Europe. Constantly in communication with the leaders of the Lavoisierian school of chemistry in Paris, which he frequently visited, De Morveau soon became convinced of the untenableness of the old phlogistic doctrines, his reasons for renouncing which are stated in his volume of the *Encyclopédie Méthodique*, p. 625, sqq. With Lavoisier, Laplace, Monge, Berthollet, and

Fourcroy, he in 1788 produced a French translation of Kirwan's *Essay on Phlogiston*, with annotations effectually disposing of the author's arguments against the new chemistry. The first manufactory of carbonate of soda in France was established by De Morveau in 1783. In 1791 he represented the department of Côte d'Or in the Legislative Assembly, and next year in the National Convention, of which he was re-elected a member in 1795. Having already become famous for aeronautical experiments at Dijon in 1783-84, he was appointed in 1794 to superintend the construction of balloons for military purposes (see *AERONAUTICS*, vol. i. p. 199). About the same time he rendered important service to his country by perfecting the processes for the manufacture of gunpowder and saltpetre. In 1796 De Morveau was made a member of the Institute. He retired from political life in 1797, and in 1798 became provisional director of the Polytechnic School, in the foundation of which he had been actively concerned. He held during 1800-14 the appointment of master of the mint, received in 1803 the cross of the legion of honour, and was made in 1805 an officer of the same order, and in 1811 a baron of the French empire. He died January 2, 1816.

Besides the above mentioned and other works, and numerous scientific papers in the *Collection académique de Dijon*, the *Journ. de Physique*, *Journ. de l'École Polytechnique*, *Mém. de l'Institut*, *Journ. des Savants*, *Bull. des Sci. de la Soc. Philomatique*, and *Ann. de Chimie*, to which last he was one of the principal contributors, De Morveau wrote—*Mémoire sur l'éducation publique*, 1762; a satirical poem entitled *Le Rat Iconoclaste, ou le Jésuite croqué*, 1763; *Discours publics et Éloges*, 1775-82; *Plaidoyers sur plusieurs questions de droit*, 1785; *Traité des moyens de désinfecter l'air*, 1801, &c.; *Rapport fait à l'Institut sur la restauration du tableau de Raphaël connu sous le nom de la Vierge de Foligno* (with Vincent, Tannay, and Berthollet), 1802; *Mém. sur les montiers*, &c., 1805; various governmental reports; and translations, with notes, of treatises by Bergman, Scheele, and Black.

See Berthollet, "Discours" *Inst. R. de France, Funérailles*, &c., 1816; A. B. Granville, *An Account of the Life and Writings of Baron Guyton de Morveau*, *F.R.S.*, 1817; T. Thomson, *Hist. of Chemistry*, II. 1821; *Bioy. Univ. et Portraits des Contemporains*, III. p. 701, 1834; and *CHEMISTRY*, vol. v. pp. 464, 466. (F. II. B.)

GUZERAT or GUJARÁT, the name given to the northern seaboard of the Bombay Presidency, extending from 20° to 24° 45' N. lat., and from 69° to 74° 20' E. long. It is to the northern part of the presidency what the Konkan is to the south, and is bounded on the N. by Rájputáná, on the E. by the spurs of the Vindhya and Sápura ranges, on the S. by the Konkan, and on the W. by the sea. On the mainland it comprises the British districts of Surat, Broach, Káira, Páneh Maháls, and Ahmedábád, with a total area of 10,082 square miles, and a population (1872) of 2,810,522; together with the great but scattered territories of the Gaikwar of Baroda, and also the native states of the Mahi Kánta and Rewá Kánta agencies, Palanpur, Radhanpur, Balasinor, Cambay, Dang, Chaurar, Bansda, Peint, Dharampur, Tharad, Sachin, Wasravi, &c. The term Guzerat is sometimes employed to include the peninsula of Káthiáwár, with its 180 petty states. The total area, inclusive of the peninsula of Káthiáwár, is 41,536 square miles. For an account of the history, geography, &c., of Guzerat, see the articles on the various states and districts. Guzerat gives its name to the vernacular of northern Bombay, viz., Gujaráthi, one of the three great languages of that presidency.

GUZMICS, IZIDÓR (1786-1839), Hungarian theologian and scholar, was born 7th April 1786 at Vámos-Család, in the county of Sopron. His early education was conducted at Kőszeg (Güns), Szombathely (Stein-am-Anger), and Sopron (Oedenburg); in the last-mentioned town he was instructed in the art of poetry by Paul Horváth. On the 28th October 1805 he entered the Benedictine order, but left it on the 30th August of the following year. Having almost immediately repented this step, he again assumed the monastic garb on the 10th November 1806. At the monastery of Pannonhegy he applied himself to the study of Greek under Farkas Tóth. In 1808 we find him

¹ Various French biographical works attribute to De Morveau, in 1773, the discovery of the efficacy of acid vapours in destroying contagious miasma. W. Boraston, however, had already in 1630 remarked—"All acetous and sewer things doe so close the powers, and passages of the humours, that no venemous ayre can enter therein as by experience I have often found" (*A Necessarie and Briefe Treatise of the Contagious Disease of the Pestilence*, pp. 11, 12); and Dr George Thomson had in 1666 described how, preparing for the "dissection of a pestilent body," he got in readiness "a porringer containing Sulphur to burn under the Corps," and how, suspecting the entry into his hand during the operation of "slic, insinuating, venomous Atoms," or, in modern phrase, septic germs, he sought to nullify their effects by holding the hand in the gas of burning brimstone (*AGNOMOTOMIA or the Pest Anatomized*, pp. 71 and 77-79).

at Győr (Raab), in the middle school of which town he was teaching during the two following years. In 1811 he was again at Pannonhegy, whence in 1812 he was sent to Pesth to study theology. Here he became acquainted with the works of the best German and Hungarian authors, and also took part in the editorship of the *Nemzeti* (National) *Plutarkus*, and in the translation of Hübner's *Lexicon*. After about four years' stay at Pesth, he obtained the degree of doctor of divinity, and returned to Pannonhegy, where he devoted himself to dogmatic theology and literature. So great was his activity that it is said that there was hardly an Hungarian periodical to which Guzmics was not a contributor. The most important of his theological works are—*A kath. anyaszentegyháznak hitbeli tanítása* (The doctrinal teaching of the Holy Catholic Church), and *A keresztényeknek vallásbeli egyesüléséről* (On Religious Unity among Christians), both published at Pesth in 1822; also a Latin treatise entitled *Theologia Christiana fundamentalis et theologia dogmatica* (Győr, 1828-29, 4 vols.). Of the other literary labours of Guzmics the most meritorious is a translation of Theocritus in hexameters published in 1824. His versions of the *Œdipus* of Sophocles and of the *Iphigenia* of Euripides were rewarded by the Hungarian Academy, of which in 1838 he was elected honorary member. From 1832 to the date of his death he was editor of the *Egyházi Tár* (Ecclesiastical Treasury). In 1832 he was appointed abbot of the wealthy Benedictine house at Bikonybél, a village in the county of Veszprém. While there he built an asylum for 150 children, and founded a school of harmony and singing. He died at Bakonybél on the 1st September 1839.

GWALIOR, a native state in political relationship with the Central India Agency and the Government of India. The state consists of several detached districts, the principal of which is bounded on the N.E. by the Chambal river, dividing it from the British districts of Agra and Etáwah; on the E. by Bundelkhand and Ságar (Saugor) districts; on the S. by the states of Bhopal and Dhar; on the W. by those of Rajgarh, Jhaláwar, and Kotah; and on the N.W. by the Chambal, separating it from Karauli (Kerowlee), and Dholpír in Rájputáná. The extreme points of the Gwalior territory are in 23° 21' and 26° 52' N. lat., 76° 31' and 79° 21' E. long. The area, including part of the ancient province of Agra and most of Malwa, is 33,119 square miles. The extreme north-eastern part is generally level, bare, and of no great fertility. A little farther south the surface rises into hills. The country is dotted over with small hills, which start abruptly out of the level plain. On one of these stands the fortress of Gwalior. The geological formation of these rocky eminences is a very fine-grained sandstone, yielding an excellent building stone. The middle tract is a plateau, having probably an average elevation of about 1500 feet. The Mandu range running east and west forms the southern boundary of the plateau, sloping gently northwards towards it, and dipping precipitously southwards towards the Narbadá (Nerbudda). The state is watered by numerous rivers. The Nerbudda, flowing west, forms the boundary of the most southern part of the state. The greater part of the drainage is discharged into the Chambal, which forms the north-western and northern and eastern boundary. The Sind, with its tributaries the Kuwári, Asar, Sankh, and other smaller streams, flows through the state. The chief products are opium, known as Malwa opium, wheat, gram, pulses of various kinds, *joár*, *bája*, *mug*, maize, rice, linseed and other oil-seeds, garlic, tumeric, ginger, sugar-cane, indigo, *al* yielding a fine red dye, tobacco, and cotton. Many species of wild beasts and birds are found throughout the state. The rivers abound in fish, especially of the carp kind.

Burhánpur is the site of a considerable manufacture of

fine cottons, silks, and rich brocades. Iron ore is raised and smelted in many places. The principal imports are British woollens, cottons, silks, cutlery, cashmere shawls, pearls from the Persian Gulf, Ceylon diamonds, and agates from Bundelkhand, gold, silver, mercury, copper, lead, and zinc. The chief exports are opium, cotton, tobacco, dyes, and iron. The Indore and Ajmere narrow-gauge railway, now (1879) in course of construction, will pass through the west of Gwalior state, while a railway on the broad gauge, to connect Gwalior town with Agra, is approaching completion.

During the hot and dry seasons the climate is not unhealthy, but during the rainy season fevers prevail, especially in the north. The range of the thermometer is unusually small, except during the sultry season, when it sometimes rises to nearly 100° during the day. The average rainfall during the rainy season is 50 inches.

The population of the north-eastern part of this territory is of many elements, comprising, besides Marhattás (the ruling race), Bundelas, Játs, and Rájputs, with some less distinctly defined divisions of Hindus and Mahometans. There is perhaps no part of India where the tribes of Bráhmans are so various and their number so great as in the southern and south-western parts. The Mahometan population is estimated at about a twentieth of the whole. Including the cessions to Sindhia under the treaty of 1860, the territories of the Gwalior state were in 1875 estimated to contain a population of about 2,500,000 souls. The total revenue in 1875 was £1,200,000. Education is afforded by 92 schools attended by 3206 pupils.

The Gwalior family, whose armies and chiefs have played so conspicuous a part in the history of India, and whose representative now rules over a state larger than Scotland and Wales united, and richer than many independent kingdoms, was founded by Ranóji Sindhia, whose father was *patel* (head-man) of a Deccan village. Once in the household of the peshwá, Ranóji's rise was rapid, and he was soon at the head of the bodyguard. After heading many Marhattá raids through Malwa into Hindustan, he was at the time of his death the acknowledged possessor of lands which still form part of the Gwalior state. He was succeeded by his son Mahádjí Sindhia, whose ability as a statesman and a soldier has rarely been surpassed. At his death he was succeeded by his grand-nephew Daulat Ráo Sindhia. The power of Sindhia was at this time most dangerous to the British Government, who now began to take measures to check the power of this chief. Sindhia entered into a league with the rájá of Berar to defeat their aim, but their allied armies were defeated in 1803 at Assaye by a British force commanded by General Sir Arthur Wellesley, subsequently duke of Wellington. By the end of the same year, the Marhattás were completely overthrown, and Sindhia was compelled to sue for peace and to sign a treaty by which he resigned his conquered territories. Eventually, by a treaty concluded in 1805, Gwalior and Gohad were ceded to Sindhia. Daulat Ráo died at Gwalior in 1827 without an heir. On his deathbed, he left the state and succession in the hands of the British Government. The succession of a boy of the Sindhia family, Múgat Ráo, to whom it was thought the wishes of Daulat Ráo turned, was admitted by the British Government. The young mahárájá was subsequently married to the granddaughter of Daulat Ráo, and took the name of Janakji Sindhia. In 1843 he died without issue. His widow, with the concurrence of the chief nobles, adopted Bajirát Ráo, a lad eight years of age. The British Government recognized the adoption, and Bajirát Ráo under the name of Báji Ráo Sindhia, succeeded, and is the present ruler (1879). Early in the regency disturbances took place, and the advance of British troops on Gwalior became necessary to restore order. Two battles, Mahárájpur and Panniar, were fought on the same day—the 29th December 1843—between the British forces and the mutinous army. They both resulted in the total defeat of the Gwalior troops. No event of historical importance has taken place since, except the revolt between the Gwalior contingent and Sindhia's army in 1857. The mahárájá's conduct throughout has been conspicuous for its loyalty. In recognition of his services, the Government conferred upon him the right of adoption, together with lands yielding a revenue of £30,000.

GWALIOR, the capital of Gwalior state, and fortress residence of the Mahárájá Sindhia, is situated in 26° 13' N. lat. and 78° 12' E. long., 65 miles S. from Agra, and 277 N.W. of Allahábád. Gwalior city has a threefold interest:—first, as a very ancient seat of Jain worship;

secondly, for its example of palace architecture of the best Hindu period (1486-1516); and thirdly, as the fortress capital of one of the greatest native chiefs of India.

Jain Remains.—There are several remarkable Hindu temples in Gwalior. One, known as the Sas Bálu, understood to be of Jain erection, is beautifully adorned with bas-reliefs, and is now resorted to both by the Vaishnav and Siva sects. It was finished in 1093 A. D., and, though much dilapidated, still forms a most picturesque fragment. An older Jain temple has been used as a mosque. Another temple in the fortress of Gwalior is called the *Tell-ka-Mandir*, or "Oilman's Temple." This building was originally dedicated to Vishnu, but afterwards converted to the worship of Siva. The most striking part of the Jain remains at Gwalior is a series of caves or rock-cut sculptures, excavated in the rock on all sides, and numbering nearly a hundred, great and small. Most of them are mere niches to contain statues, though some are cells that may have been originally intended for residences. One curious fact regarding them is that, according to inscriptions, they were all excavated within the short period of about thirty-three years, between 1441 and 1474. Some of the figures are of colossal size; one, for instance, is 57 feet high, which is taller than any other in the north of India.

Hindu Palace Architecture.—The palace built by Mán Sinh (1486-1516) forms the most interesting example of early Hindu work of its class in India. Another palace of even greater extent was added to this one in 1516; both Jahángir and Sháh Jahán added palaces to these two,—the whole making a group of edifices unequalled for picturesqueness and interest by anything of their class in Central India. Among the apartments in the palace was the celebrated chamber, named the *Báradári*, supported on 12 columns, and 45 feet square, with a stone roof, forming one of the most beautiful palace-halls in the world. It was, besides, singularly interesting from the expedients to which the Hindu architect was forced to resort to imitate the vaults of the Moslems. Of the buildings, however, which so excited the admiration of the emperor Bábar, probably little now remains.

Rock Fortress.—The fort of Gwalior stands on an isolated rock. The face of the fort is perpendicular, and where the rock is naturally less precipitous it has been scarped. Its greatest length from north-east to south-west is a mile and a half, and the greatest breadth 300 yards. The rock attains its maximum height of 342 feet at the northern end. A rampart, accessible by a steep road, and farther up by huge steps cut out of the rock, surrounds the fort. The citadel stands at the north-eastern corner of the enclosure, and presents a very picturesque appearance. The old town of Gwalior, which is of considerable size, but irregularly built, and extremely dirty, lies at the eastern base of the rock. It contains the tomb of Muhammad Ghaus, which was erected during the early part of Akbar's reign. The fort of Gwalior, according to Wilford, was built in 773 A. D. by Surya Sen, the rájá of the neighbouring country. In 1196 Gwalior was captured by Mahmúd Ghori; it then passed into the hands of several chiefs until in 1556 Akbar gained possession of it, and made it a state prison for captives of rank. On the dismemberment of the Delhi empire, Gwalior was seized by the Ját rána of Gohad. Subsequently it was garrisoned by Sindhia, from whom it was wrested in 1780 by the forces of the East India Company. A contest took place about the successor of Janakji, governor of Gwalior, the adopted son of Daulat Ráo Sindhia, who died in 1843 without an heir. A revolution was impending, and the British Government had to interfere. Troops crossed the Chambal, and unexpectedly found the insurgent forces drawn up at Mahárájpur, a few miles distant from the fortress. A battle ensued on the 29th December 1843, resulting in the complete overthrow of the Marhattás. The British contingent stationed in the town was increased, and affairs were placed on a peaceful footing.

GWILT, JOSEPH (1784-1863), author of the *Encyclopedia of Architecture*, was the younger son of George Gwilt, architect surveyor to the county of Surrey, and was born at Southwark, January 11, 1784. He was educated at St Paul's school, and after a short course of instruction in his father's office was in 1801 admitted a student of the Royal Academy, where in the same year he gained the silver medal for his drawing of the tower and steeple of St Dunstan-in-the-East. In 1811 he published a *Treatise on the Equilibrium of Arches*, and in 1815 he was elected a fellow of the Society of Antiquaries of London. After a visit to Italy in 1816, he published in 1818 *Notitia Architectonica Italiana, or Concise Notices of the Buildings and Architects of Italy*. In 1825 he published, with notes and valuable additions, an edition of Sir William Chambers's *Treatise on Civil Architecture*; and among his principal other contributions to the literature of his profession are a trans-

lation of the *Architecture of Vitruvius* (1826), a *Treatise on the Rudiments of Architecture, Practical and Theoretical* (1826), and his valuable *Encyclopædia of Architecture* (1842), which has passed through a great many editions, and was published with additions by Wyatt Papworth in 1867. In recognition of Gwilt's advocacy of the importance to architects of a knowledge of mathematics, he was in 1833 elected a member of the Royal Astronomical Society. In addition to the sciences bearing on his profession he took a special interest in philology and music, and is the author of *Rudiments of the Anglo-Saxon Tongue* (1829), and of the article "Music" in the *Encyclopædia Metropolitana*. His works as a practical architect are not of much importance, the principal being Markree Castle near Sligo in Ireland, and St Thomas's Church at Charlton in Kent. He succeeded his father as a surveyor of sewers for the county of Surrey, and held that office till 1818. He died September 14, 1863.

GWYNIAD is the name given to a fish of the genus *Coregonus* (*C. clupeioides*), inhabiting the large lakes of North Wales and the north of England. At Ullswater it is known by the name of "schelly," at Loch Lomond by that of "powen." It is tolerably abundant in Lake Bala, keeping to the deepest portion of the lake for the greater part of the year, but appearing in shoals near the shores at certain seasons. It is well flavoured, like all the species of *Coregonus*, but scarcely attains to the weight of a pound. The name gwyniad is a Welsh word, and signifies "shining"; and it is singular that a similar fish in British Columbia, also belonging to the family of Salmonoids, is called by the natives "quinnat," from the silvery lustre of its scales, the word having in their language the same meaning as the Welsh "gwyniad."

GYARMAT, a Magyar term signifying *colony*, and applied to several places in Hungary. Of these the following two towns have the largest number of inhabitants.

BALASSA-GYARMAT, capital of the Cis-Danubian county of Nógrád, is situated on the Ipoly (Eipel), about 40 miles N.N.E. of Budapest, 48° 6' N. lat., 19° 16' E. long. It is the seat of a royal court of law and of the assizes, and has Roman Catholic and Lutheran churches, also a Jews' synagogue, a fine county hall, a house of correction, a religious institute for girls, and tax, post, and telegraph offices. In 1870 the population was 6435, Magyars and Slavs by nationality.

FÜZES-GYARMAT, a market-town in the Trans-Tibiscan county of Békés, is somewhat unfavourably situated in the extensive marshy tract of country known as the Sárrét, 47° 5' N. lat., 21° 13' E. long. The town has few noteworthy buildings, with the exception of the Calvinist church and some elegant private residences. The chief products of the rich, dark, alluvial soil of the neighbourhood are wheat, tobacco, hay, grapes, and other fruits. Horned cattle, pigs, and sheep (both merino and Hungarian) are bred on the wide-spreading pasture-lands, and numerous water-fowl and wading birds, especially herons, inhabit the reed-covered marshes. The water used for drinking purposes is, however, frequently muddy and warm, and unpleasant to the taste. In 1870 the population was 5735, of whom the great majority were Magyars.

GYARMATHA, a market-town in the county of Temes, Hungary, situated in a level but productive agricultural district to the north-east of Temesvár, 45° 50' N. lat., 21° 17' E. long. For some distance round the town the cultivation of wheat, barley, oats, maize, and the vine is largely carried on. Horse-breeding is another source of employment to many of the inhabitants. Gyarmatha has few buildings of special interest with the exception of a Roman Catholic church and the ruins of a fort. In 1870 the population amounted to 5125, consisting of Germans, Magyars, and Wallachs.

GYERGYÓ-SZENT-MIKLÓS, a market-town of Hungary, in the Transylvanian county of Csik, is situated in a mountainous but well-wooded district, 96 miles E. of Klausenburg, and about 25 W. of the Moldavian frontier, 46° 42' N. lat., 25° 33' E. long. Among the more important buildings are a Roman and a Greek Catholic church, a fine public school, a royal court of justice, and the post and telegraph offices. There are also cattle and timber trading houses, an office of woods, a financial commission agency, and a police station. Cattle and sheep are reared in great numbers in the surrounding country, which is noted also for its cheeses, and for the preparation of gin. The number of inhabitants at the commencement of 1870 was 5645, consisting of Magyars, Wallachs, and Magyarized Armenians, the descendants of a band of wanderers who settled here in 1668.

GYGES, founder of the third dynasty, called Mermnad, of Lydian kings, reigned about 687-654 B.C. (*v. Gelzer in Rhein. Mus.*, xxx.). The kindred name Gygæa, applied by Homer (*Il.*, ii. 684) to the Maconian lake, mother of the Maconian leaders, supports the statement of ancient historians that he belonged to an old Lydian family. In the reign of Candaules, Gyges, perhaps after banishment, attempted during the troubles caused by the Cimmerian invasions into Asia Minor, to gain the royal power. He was aided by foreign, especially Carian, mercenaries, but was strenuously resisted by the native population. At last it was agreed to refer the decision between the old Heraclid dynasty and the new claimant to the national god Heracles; but, to ensure impartiality, they appealed to him under his Greek form of Apollo. The Delphic oracle gave its answer in favour of Gyges, and the presents with which his gratitude enriched the shrine were seen and described by Herodotus. This story points to familiar and friendly intercourse between Lydia and the Greek states; and that the circumstance impressed itself on the Hellenic mind is shown by many romantic tales current about the fortunes of Gyges (*Plato, Rep.*, ii. p. 369; *Herod.*, i. 8). The contemporary poet Archilochus speaks of the riches of Gyges. Under the Heraclid dynasty Ionian settlers had occupied the whole coast of Lydia, and in friendly relation with the country had rapidly prospered. But the warrior king who now began to rule was not content to leave the sea-coast in the undisturbed possession of foreigners. He and his successors maintained almost constant war with the Ionian cities. Gyges captured Magnesia and the lower city of Colophon; but the inroads of the Cimmerians diverted his attention from conquest to the defence of his own capital. At one time he was so hard pressed that he applied to Assyria for help (about 660 B.C.), and paid tribute to Assurbanipal in return for protection against these barbarians. But he afterwards threw off allegiance and assisted Psammetichus, who had revolted in Egypt against the Assyrian rule. It is mentioned in an inscription of Assurbanipal that Gyges was slain in battle by the Cimmerians, and that his son Ardys renewed the tribute.

For a full account of the reign of Gyges, and the ancient authorities for it, see Duncker, *Gesch. d. Alterthums*, vol. ii.

GYLLEMBOURG-EHRENSVÄRD, THOMASINE KRISTINE, BARONESS (1773-1856), the most eminent female writer of Denmark, was born November 9, 1773, at Copenhagen. Her maiden name was Buntzen. Her great beauty early attracted notice, and before she was seventeen she married the famous political writer Peter Andreas Heiberg. To him she bore in the following year a son, afterwards illustrious as the poet and critic Johan Ludvig Heiberg. In 1800 her husband was exiled and she obtained a divorce, marrying in December 1801 the Swedish Baron Ehrensvärd, himself a political fugitive. Her second husband, who

presently adopted the name of Gyllembourg, died in 1815. In 1822 she followed her son to Kiel, where he was appointed professor, and in 1825 she returned with him to Copenhagen. In 1827 she first appeared as an author by publishing her romance of *The Polonius Family* in her son's newspaper *The Flying Post*. In 1828 the same journal contained *The Magic Ring*, which was immediately followed by *An Everyday Story*. The success of this anonymous work was so great that the authoress adopted until the end of her career the name of "the Author of *An Everyday Story*." From this time forward she took a foremost place among the writers of her time, but preserved her anonymity with entire success. In 1833-34 she published three volumes of *Old and New Novels*. *New Stories* followed in 1835 and 1836. In 1839 appeared two novels, *Montanus the Younger* and *Ricida*; in 1840, *One in All*; in 1841, *Near and Far*; in 1843, *A Correspondence*; in 1844, *The Cross Ways*; in 1845, *Two Generations*. From 1849 to 1851 the Baroness Ehrensvärd-Gyllembourg was engaged in bringing out a library edition of her collected works in twelve volumes. On the 2d of July 1856 she died in her son's house at Copenhagen. Not until then did the secret of her authorship transpire; for throughout her life she had preserved the closest reticence on the subject even with her nearest friends. The style of Madame Ehrensvärd-Gyllembourg is clear and sparkling; for English readers no closer analogy can be found than between her and Mrs Gaskell, and *Cranford* might well have been written by the witty Danish authoress. She introduced into the literature of her country a novel vein of realism and domestic humour, and, although she has had many imitators, she is still without a rival.

GYMNASIUM was the name applied by the Greeks to a building designed for the practice of physical exercises. From the earliest times we hear of athletic sports in honour of heroes and gods. Sometimes they are celebrated among the funeral rites of a deceased chief, sometimes they form part of a periodic festival. At first competitors exercised stripped of their outer garments (*γυμνοί*); hence arose the name gymnasium. Afterwards the habit of exercising naked became universal. In the continuance of their history the Greeks grew more attached to such sports; their free active life, spent to a great extent in the open air, fostered the liking almost into a passion. The victor in any athletic contest, though he gained no money prize, was rewarded with the honour and respect of his fellow-citizens; and a victory in the great religious festivals was counted an honour for the whole state. In these circumstances the training of competitors for the greater games became a public concern; special buildings and officials were provided for the purpose by the state. But, as gymnastics became more and more an institution of social life, the gymnasia were applied to other uses even more important. The most interesting points are the connexion with education on the one hand, with medicine on the other. Due training of the body and maintenance of the health and strength of children were the chief part of earlier education. Except the time devoted to letters and music, the education of boys was conducted in the gymnasia, where their moral training was as carefully attended to by special officers as their physical exercises. As they grew older conversation and social intercourse took the place of the more systematic discipline. Philosophers and sophists assembled to talk and to lecture in the gymnasia, which became places of general resort for the purpose of all less systematic intellectual pursuits, as well as for physical exercises. Plato, when treating of education, devotes much consideration to gymnastics (see especially *Rep.* iii. and various parts of *Leges*). Gymnastic exercises proper were designed, not merely as in Sparta, to foster the taste for war and the activity and strength needed for using weapons, but also to

produce graceful carriage and healthy tone of the body. According to Plato, the sophist Prodicus first pointed out the connexion between gymnastics and health. Having found such exercises beneficial to his own weak health, he formulated a method which was adopted generally, and which Hippocrates improved on. Galen lays the greatest stress on the proper use of gymnastics, and throughout ancient medical writers we find that special exercises are prescribed as the cure for special diseases. The regulation of the gymnasium at Athens is attributed by Pausanias (i. 39, 3) to Theseus; Solon made several laws on the subject; but, according to Galen, it was reduced to a system in the time of Clisthenes. Ten gymnasiarchs, one from each tribe, were appointed annually. These performed in rotation the duties of their office, which were to maintain and pay the persons that were training for public contests, to conduct the games at the great Athenian festivals, to exercise general supervision over the morals of the youths (they could, for example, remove any philosopher whose teaching they thought injurious), and to adorn and keep up the gymnasium. This office was one of the ordinary *λειτουργίαι*, and great expense was entailed on the holders. Under them were ten *séphronistæ*, with a salary of a drachma per day. Their duty was to watch the conduct of the youths at all times, and especially to be present at all their games. The practical teaching and selecting of the suitable exercises for each youth were in the hands of the *pædotribæ* and *gymnastæ*. The latter also superintended the effect on the constitution of the pupils, and prescribed for them when they were unwell. *Aliptæ* oiled and rubbed dust on the bodies of the youths, acted as surgeons, and administered the drugs prescribed.

The gymnasia built to suit these various purposes were large buildings which contained, not merely places for each kind of exercise, but also a stadium, baths, covered porticos for practice in bad weather, and outer porticos where the philosophers and men of letters read public lectures and held disputations. In Athens there were three great public gymnasia,—Academy, Lyceum, and Cynosarges,—and every Greek city of consequence seems to have possessed one. Ruins of them exist at Pergamus, Ephesus, Alexandria in Troas, &c., from which, and from the accounts of Vitruvius (v. 11), it would appear that all were constructed on much the same plan. The details will be found most clearly given in Rich's *Dictionary of Greek and Roman Antiquities*.

Much of the healthy buoyant elasticity of mind for which the Greek race is remarkable, as well as the active and beautiful physical development which no other race has ever equalled, is due to the love of gymnastics. The plastic art also owes its perfection in the treatment of the human form to the constant opportunity which artists had of observing the nude body in various attitudes. But abuses were liable to occur. The careful provisions made by Solon and later legislators to keep up the moral character of the gymnasia did not prevent them from fostering the vice which appears so much in Greek life. Though introduced in Rome, where Nero built the first public gymnasium, gymnastics did not suit Italian habits, and never became popular.

Gymnasium, in its modern use, generally signifies a school for gymnastic exercises, but it is sometimes used also to denote a higher school intended to give immediate preparation for the universities. The latter application of the term is specially prevalent in Germany.

GYMNASTICS, in the general acceptance of the term, denotes every exercise which tends to develop and invigorate the bodily powers, such as walking, running, riding, fencing, rowing, skating, dancing, and many others. In another sense gymnastics includes those manly and healthful games which have been encouraged by all high-minded nations

as calculated to improve the physical strength and keep alive the martial spirit of their people. In a more limited sense, the term has been employed to denote the modern system of bodily exercises. Physical strength was the veritable god of antiquity, and we therefore find the elements of a system of gymnastics in most nations from the earliest times. In the infancy of society, when the individual was valued according to his personal strength and prowess, it was only natural that the utmost care should be bestowed on those arts which most surely led to distinction. All education then consisted chiefly in the practice of such exercises as were best calculated to develop muscular strength and make the tenure of life as secure as possible. The first gymnastic exercises, both of those nations that reached the highest civilization and of barbarians, were the same, viz., running, leaping, swimming, and the throwing of missiles. These exercises were at a very remote period systematized and reduced to a science by the Greeks (see GYMNASIUM). Among the Romans of the republic, the games in the *Campus Martius*, the duties of camp life, and the preliminary military exercises to which the soldier devoted himself, besides the enforced marches which were imposed upon him, and the part he took in the erection of public edifices, served to take the place of the gymnastic exercises required by the Greeks. In the Middle Ages, chivalry with its jousts, its feats of horsemanship, and encouragement to the arts of fencing, single stick, &c., took the place of the ancient gymnastic exercises. The invention of gunpowder, which modified the system of warfare, and the increasing value of individual life,—in a word, the progress of civilization—closed the career of the champions and votaries of physical strength, and gymnastic exercises in the course of time were neglected. Rousseau, in his *Emile*, was the first to call attention to the injurious consequences of such indifference; and it is in a large measure to his eloquent appeals that gymnastics have in recent times been held to constitute an integral part of school education, although it cannot be said that in every country the practical application of his views has met with much success. The good effects of the innovation which he advocated have nowhere been more strikingly exemplified than in Germany. When many parts of that country groaned under the iron yoke of Napoleon, Jahn and his followers, encouraged by the Prussian minister Steiu, were establishing *Turnplätze* or gymnastic schools, from which issued the well-trained youth who in due time drove the French legions across the Rhine.

Of late years public attention has been drawn to the increasing deterioration in the physique of the population of England, and several proposals have been put forward to check an evil which can no longer be concealed. These proposals may be arranged under the banners of two rival camps. The one maintains the opinion put forward in a work just published on exercise and training, in the following words (*Exercise and Training*, 1878):—

“In our opinion the natural varieties of exercise of cricket, football, and rowing for boys, hunting, shooting, &c., for men, pursued at the different seasons of the year, are quite sufficient for a proper development of all parts of the body, in accordance with the uses of the different limbs, for the development of special muscles; or, where a great variety of exercise cannot be procured, a system of gymnastics may be pursued. To the advocates for the adoption of systematic physical education by means of gymnasia at our schools, whilst we concede the immense value of such establishments in our large towns, where outdoor exercise and field sports are difficult of attainment, or in cases where from the physical debility the muscles have to be gradually developed, still we maintain that the national games played by the English schoolboy are infinitely superior to any system of artificial exercise ever devised.”

On the other side we have the advocates of physical education by means of regular gymnastic exercises superintended by trained and educated teachers, the whole placed

under competent medical supervision. Among the staunch supporters of the latter view may be named Dr Roth, and Mrs Westlake, a member of the London School Board. The following considerations appear to be of great weight as supporting the views put forward by the advocates of physical education. While the national games may seem to some sufficient for the physical development of the ordinary youth and manhood of a country, it must not be forgotten that there is a vast and rapidly increasing portion of the population, especially in large cities, to whom the "national games" are quite unknown diversions, and that it is among this class that the most marked deterioration in physical development is only too apparent. The children of this class dwell cooped up in narrow, ill-lighted, and worse-ventilated courts, from which they are often dragged to undergo a certain amount of mental training, in many cases perhaps too severe to be sustained by their debilitated and enfeebled bodies. Whilst so much is being done for the mental culture of the rising generation, their physical culture is left very much to inclination or chance. But there is another source of danger put forward by those who advocate the sufficiency of the national games, viz., "the neglect of any classification of games at school, and allowing the weak and strong to engage in them indiscriminately, to the detriment of the physical wellbeing of the more delicate;" and they proceed to show the injury that may be done by the present system of competitive outdoor sports unregulated by judicious restraint. Important information on this subject will be found in two papers published in the *St George's Hospital Reports* for 1874-76, by Mr C. Roberts, F.R.C.S., and by Mr Street, and another in the *Tenth Annual Report of the State Board of Health of Massachusetts*, by Professor Edward Hitchcock. Mr Roberts points out that between the ages of fifteen and seventeen the greatest amount of physical development takes place, and that if at this period a boy is subjected to a great strain upon his strength his future growth may be interfered with, or the foundation laid of constitutional disease. Prof. Hitchcock's paper embodies the experience of seventeen years of careful observation. Acting upon the well-grounded opinion that neither mental serenity nor mental development can exist with an unhealthy animal organization, and admonished by "the sad deaths of two promising young men, and the breaking down in health of others just at the end of their college courses," the authorities of Amherst College were impelled to demand that the college officials should give a proper attention to physical health as well as to the culture of those powers for which departments were ordinarily created and endowments made. In 1859 a department of physical education and hygiene was created, concerning which we read in the catalogue of 1861-62 that—

"Its design is to secure healthful daily exercise and recreation to all students; to instruct them in the use of the vocal organs, movements of the body, and manners, as connected with oratory; and to teach them, both theoretically and practically, the laws of health. This daily physical training is a part of the regular college course. The professor is an educated physician, and has not only a general oversight of the health of the college, but students have the privilege of consulting him without charge. While the gymnasium will furnish opportunities for the highest physical training, the required exercises will be such as can be performed without undue effort or risk of injury."

Each class, at a stated hour on four days of the week appears at the gymnasium, and all perform their part in systematic and methodical exercises timed to music. The statistics of this department show some interesting facts in reference to the duration of sickness among students. While the average amount of time lost on account of sickness by each labourer in Europe is found to be 19 or 20 days each year, the returns of Amherst College sick-list for ten times give 2.64 days as an annual average of time lost to every student, and 11.36 days to each sick student for

17 years. A decrease in the amount of sickness during the course is also an important feature in the health of the college.

From replies to questions put by Dr Roth to the heads of the educational bodies, and also from the recorded personal experience of his son, Mr B. Roth, F.R.C.S., it appears that considerable attention is now being paid to the best methods for improving the physical education of the people in nearly all the Continental states. The greatest activity is perhaps shown by Sweden, Germany, France, Belgium, and Italy; and even in Russia the question is attracting much public attention, Dr Berglund having been ordered to write a special book on the subject. In Hungary also the Government has made physical education an obligatory part of the school curriculum. In Prussia gymnastic instruction was formally recognized by a cabinet order of June 1842, and by a royal order of 1862 a guide-book of gymnastic instruction was introduced into the primary schools and into the training colleges for teachers. In Sweden this subject appears to have earlier attracted attention, for in 1813 the Government, under the direction of P. H. Ling, founded the Royal Central Gymnastic Institute at Stockholm, where teachers of both sexes are gratuitously trained for two years, and receive a diploma after undergoing a theoretical and practical examination. In Belgium, under the united efforts of MM. Delcour and Émile Greyson, considerable progress has been made, although much has still to be done, owing to the opposition raised by the municipality of Brussels to the views put forward by the Government. In the girls' schools the exercises are accompanied by music, after the example set by Colonel Ameros, who about the beginning of this century introduced into France a series of gymnastic exercises adapted to a jingling rhyme and to music. The chanting governed the movements, marked the intervals of repose, and helped to strengthen the organs of the voice and respiration. In France the necessity for the physical education of the people began to attract attention about the year 1845, owing probably to the energy displayed by Jahn in Prussia. M. de Salvandy proposed to introduce the teaching of gymnastics into the Lycées of Paris and Versailles, and a commission was appointed by him, which, however, never presented a report. In 1850, 1851, 1855, and 1856 several attempts were made to enforce compulsory gymnastic training, but the principle was not accepted till 1869, when M. V. Duruy took for his basis of action the labours of the commission presided over by Dr Hillairet. After the fall of the empire, M. Jules Simon addressed the head masters of the colleges and schools in France as follows:—

"I beg you to assist me in introducing gymnastics into our habits in a profitable and earnest manner. This is not only in the interest of public health; a healthy child is better prepared for study, and especially for the battle of life. Morality gains by this education of the body; much money is not wanted for the purpose; and in case of need, exercises can be performed without a trapeze or dumb-bells. Our medical men will help us to do our task; if the children are once accustomed to, and take pleasure in, these healthy exercises, we may be sure of a prompt amelioration of the race."

In England we find that the first attempt to introduce scientific physical education among the people was made in parliament in 1862 by Lord Elcho. This attempt failed, as also did another made in 1875 by P. A. Taylor, M.P. for Leicester, although supported in an able speech by Mr Butler Johnstone. Lord Sandon, then vice-president of the committee of council on education, told Parliament that "the Government has done all that could be expected of them for physical education by taking steps to substitute military drill for ordinary drill." The substitution, it may be remarked, does not appear to have any advantage over the drill it displaced, as the military authorities declared the ordinary military drill to be insufficient for the re-

quirements of the soldier, and have during the last sixteen years instituted gymnasiums at Aldershot, Gibraltar, Malta, and elsewhere, the teachers in which have, for the most part, passed under the care of Mr Maclaren of Oxford, one of the principal authorities on the subject in England. Without entering into details, it may be admitted that the physical condition of the people, if not actually deteriorating, is not improving, and it is a significant fact that within the last year or two it has been found necessary to lower the standard in the British army, and that Dr Ord, in his report for 1869, states that out of 5567 boys 4410 were rejected as under the standard of width of chest and height. We have already referred to the tendency to rely on the casual outdoor sports for maintaining the physique of the population, and to a great extent to depreciate systematic gymnastic exercises and physical education. That in some quarters, however, this opinion is not entertained is shown from the fact that the London School Board has appointed Miss Löfving of the Stockholm Training College to instruct certain of their teachers so as to fit them for teaching the girls in the schools. It is to be regretted that in the blind asylums so little is done for the physical education of the inmates. An institution in Milan provides for the training of rickety children by carefully regulated gymnastic exercises; but this institution seems to be the only one of its kind in Europe.

To show that the importance of gymnastics has not been overstated, we may describe the effects produced on twelve non-commissioned officers sent by the military authorities to be trained as teachers for the British army by Mr Maclaren. The men ranged from nineteen to twenty-nine years of age, and in height from 5 feet 5 inches to 6 feet. In Mr Maclaren's own words, "the muscular additions to the arms and shoulders and the expansion of the chest were so great as to have absolutely a ludicrous and embarrassing result, for before the fourth month several of the men could not get into their jackets and tunics without assistance, and when they had got them on they could not get them to meet down the middle by a hand's breadth." In a month more they could not get into them at all, and new clothing had to be procured, pending the arrival of which the men had to go to and from the gymnasium in their greatcoats.

Although there is some diversity of opinion among teachers of gymnastics as to the relative value of the different exercises, some holding that "free exercises" are sufficient, others that certain mechanical appliances are necessary, yet all agree that, to ensure healthy and perfect development of the organs of the body, a course of gymnastics must commence with such simple exercises as walking, running, jumping, &c. The introductory course ordinarily consists of "movements and positions" and the use of dumb-bells and bar-bells. In some French gymnasiums, especially those presided over by M. Laisné of Paris, an instrument invented and called by him a "xylofer" is in use, consisting of a wooden stick strengthened and weighted with a rod of iron, and corresponding apparently to the bar-bell of English teachers. Another form of movable apparatus, also in use in some Continental schools, consists of sticks on which slide wooden spheres of from 6 to 7 inches diameter, prevented from slipping off by india-rubber rims at each end. The movements which accompany the use of the stick are intended to expand the chest and increase the power of the muscles of the back. In stretching the arms outwards from the bent position, the spheres fly outwards and very much increase the energy of the movement.

For the preliminary exercises with movable apparatus, the dumb-bell is that usually selected. It was in use in England in the time of Elizabeth. It has many advantages over the Indian club, the practice of the dumb-bell requiring a less amount of room, and not presenting the risk the club does of overstraining the body by its unskillful use.

The dumb-bell admits of being exactly proportioned to the individual strength of each learner, and can be adjusted in weight as his strength increases. The exercises also that may be performed with it give employment to all parts of the body and to both sides equally. The bar is simply a two-handed dumb-bell. Next in order come walking, running, and leaping, the exercises being so regulated that both the distance and speed are gradually increased. The *leaping rope* is suspended from a beam, and enables the leaper to

clear a barrier at the same time that it gives employment to both the upper and lower limbs. The *leaping pole* is usually made of ash, and varies from 8 to 10 feet in length. Its use may be left to the pleasure of the pupil after he has acquired some dexterity, with the leaping rope.

The *horizontal beam* is a round wooden beam so mounted that it may be moved up and down. The exercises on this are chiefly balancing the body in the sitting and erect posture, and when moving along it.

The *vaulting bar* differs from the preceding in being somewhat thinner, so as to be easily grasped by the hand. The appropriate exercises on it have for their object the strengthening of the muscles of the upper extremity and loins. The *vaulting horse* allows of a wider range of exercises, and requires a greater amount of strength and dexterity. The muscles of the upper and lower limbs and trunk are all benefited by its use. The *fixed parallel bars* are used to develop the muscles of the trunk and upper limbs, but chiefly the former. The *movable parallel bars* may be used for the same exercises as the preceding. The *trapez* consists of a horizontal bar suspended by ropes at a height of 4 or 5 feet from the floor. Considerable practice is required to perform the exercises on this machine with dexterity and neatness. The *horizontal bar*, the *bridge ladder*, the *plank*, the *inclined plane*, the *prepared wall*, and the *mast*, and several modifications of these that are used, permit of a great variety of exercises.

In "calisthenics" the exercises are more directed to ensure grace and ease in the several movements of the body than muscular development, and are, therefore, closely allied to the "movements and positions" or "free exercises" of the gymnast. Among these exercises dancing takes a prominent part, being at once healthful and graceful.

See Combe's *Education, its Principles and Practice*, edited by Jelly; Maclaren's *Physical Education*; the various works (in French) of Prof. N. Laisné, Capt. Doex, and Dr Le Blond; and numerous pamphlets by Dr Roth. "I. A. II.)

GYMNOTUS. See EEL and ELECTRICITY.

GYNÆCOLOGY (from the Greek γυνή, *gynaikos*, a woman, and λόγος), that branch of medicine which concerns the pathology and treatment of affections peculiar to the female sex. See MEDICINE.

GYOMA, an old market-town in the Trans-Tibiscan county of Békés, Hungary, is situated on the banks of the Körös main stream, 46° 57' N. lat., 20° 50' E. long. It has a fine town-hall, Roman Catholic, Calvinist, and Lutheran churches, a Jews' synagogue, tax, post, and telegraph offices, a brewery, several elegant private residences, and a large station on the Szolnok-Arad Railway. The soil of the surrounding country, though in some places clayey, is in others of a rich and productive character, and the inhabitants succeed in raising plentiful crops of wheat, mangocorn, barley, millet, and maize, besides cultivating several kinds of orchard fruit and grapes. The more considerable landholders rear great numbers of sheep, pigs, and horned cattle. An abundant supply of fish and waterfowl is yielded by the Körös, which is here spanned over by a wooden bridge and by the railway. Enormous quantities of firewood are floated down the stream on rafts. The fields are protected from floods by a large dike, whilst a similar service is rendered by the Nagy-Iván, Csergetyüi, Jokai, and Német trenches, which usually become dry during summer. In 1870 the population of Gyoma was 9907, by nationality Magyars. Before 1682 three other communes, viz., Ege, Pó, and Nyárszeg, stood on the wide-spreading tract belonging to Gyoma. In that year they were, however, completely destroyed, and now only traces of their former existence remain.

GYÖNGYÓS, the second town in importance of Heves county, Hungary, is situated at the foot of the Mátra, south-west of Eger (Erlau), and is connected by a branch line with the Budapest-Miskolcz royal state railway, 47° 47' N. lat., 19° 59' E. long. Gyöngyös is the seat of a court of justice, and of a board of taxes, and contains three churches, a large monastic establishment belonging to the Franciscans, a gymnasium, manufactories of leather, hats, and woollen cloth, and distilleries. The town carries on a brisk trade, especially in the Vissontacr and Egri (Erlauer) red wines, which are produced in great quantities in the

neighbourhood. In 1870 the population was 15,830, mostly Magyars by nationality. The Hungarians defeated the Austrians at Gyöngyös on the 3d April 1849.

GYÖNGYÖSI, ISTVÁN or STEPHEN (1620–1704), one of the most talented Hungarian poets of the 17th century, was born of poor but noble parents in 1620. The county of his birth is variously given as Gömör or Bons, the date as August 5 or November 3. His abilities early attracted the notice of Count Ferencz Wesselényi, who in 1640 appointed him to a post of confidence in Fülekk castle. Here he remained till 1653, when he married, and commenced his public career as an assessor of the judicial board. In 1681 he was elected as a representative of his county at the diet held at Soprony (Oedenburg). From 1686 to 1693, and again from 1700 to his death in 1704, he was deputy lord-lieutenant of the county of Gömör. Of his literary works the most famous is the epic poem *Murányi Venus* (Caschau, 1664), which hymns the praises of his benefactor's wife Maria Szécsi, the heroine of Murány. Among his later productions the best known are —*Róza-Koszorú*, or *Rose-Wreath* (1690), *Kemény-János* (1693), *Cupidó* (1695), *Palinodia* (1695), and *Chariklia* (1700). His poems are chiefly remarkable for energy, feeling, and popular sentiment. The earliest edition of his collected poetical works is by Dugonics (Pressburg and Pesth, 1796); the best modern selection is that of Toldy, entitled *Gyöngyösi István válogatott poétai munkái* (Select poetical works of Stephen Gyöngyösi), 2 vols., 1864–65.

GYPSUM, the hydrated sulphate of lime, $\text{CaSO}_4 \cdot 2\text{H}_2\text{O}$, is a mineral substance occurring in various rock formations, especially in Tertiary deposits, in very considerable abundance and under varying conditions. In its transparent crystalline state it is known as selenite when it presents a finely fibrous opalescent appearance, is termed satin spar; and the name alabaster is reserved for the pure milky white massive varieties. Gypsum is very generally disseminated, the most famous locality for the finer qualities worked into alabaster vases and figures being Castelino, about 30 miles from Leghorn; while Montmartre, Argenteuil, and other places in the environs of Paris, and in the neighbourhood of Derby in England, furnish inexhaustible supplies chiefly for the preparation of plaster of Paris and for agricultural use, &c. It is also found in large quantities in Nova Scotia, New York, Virginia, and Michigan. The application of gypsum as a manure is referred to under AGRICULTURE, vol. i. p. 351, and its employment for ornamental purposes is described under ALABASTER, vol. i. p. 439. The preparation of plaster of Paris, so called from the fact that the industry chiefly centres in several Parisian suburbs, is the principal primary object of the quarrying or mining of gypsum. By the application of heat gypsum begins, at a temperature of about 175° Fahr., to part with its combined water. An increase of temperature causes the desiccation to proceed with great rapidity, and for manufacturing purposes the best results are obtained at from 230° to 250°. For making plaster of Paris, gypsum is burnt in kilns at about the latter temperatures, and subsequently it is powdered and ground to a fine uniform flour. So prepared it possesses the valuable property of recombining with water when mixed with it, and setting, from a thin paste, into a solid mass, the phenomenon being accompanied with some expansion and the evolution of heat. It is to this property of recombining with water that the value of plaster of Paris is principally due. When, however, gypsum is burnt at a temperature of 480° and upwards, the sulphate rehydrates only with great difficulty, and at still higher temperatures it loses all power of absorbing water, and in this respect it then resembles anhydrite, the natural water-free sulphate of lime. Plaster of Paris is largely used for obtaining copies of statuary figures, coins, medals, sculptures, and

carvings, and also for taking casts from natural objects. It is also employed as the material for moulds for electrodeposits, and for the manufacture of embossed and pressed pottery ware. Still more extensively is it consumed in the finishing of internal plaster work in houses, and for making cornice mouldings and other architectural enrichments in positions sheltered from the weather. Plaster of Paris work is, like gypsum, soluble in water at a temperature of 32° to the extent of .205 per cent., rising to a maximum solubility of .254 at 95° Fahr. Plaster casts made simply with water are soft, porous, and easily injured, and various plans have been devised for producing a harder and more compact body with plaster. Keene's cement, which may be taken as a type of the hardened plasters, is made by treating the burnt gypsum in a solution of 1 part of alum to 12 of water at a temperature of about 95°. After about 3 hours the plaster is removed, dried, and rebaked in the furnace, and then thoroughly ground and powdered. Thus prepared, the plaster needs comparatively little water to slake it, and it sets much more slowly than the ordinary plaster, while the comparative tenacity of the two varieties is as 1.5 to 1. Parian cement is plaster hardened with water containing 10 per cent. of borax; and stucco is plaster rendered tenacious by being prepared with a strong solution of glue. When water containing lime or a solution of gum-arabic is used to slake burnt gypsum, a hard plaster is also obtained, which by smoothing, colouring, and subsequent polishing with oil assumes a marble-like surface. A fair imitation of meerschaum is also made in hardened plaster by polishing, tinting the surface with a solution of gamboge and dragon's-blood, and treating it with either melted paraffin or stearic acid. It is understood that the cheaper "meerschaum" pipes and cigar-holders are thus prepared.

GYROSCOPE, GYROSTAT, are names given to instruments which are used to demonstrate certain properties of rigid bodies, when made to rotate rapidly about the axis round which they are kinetically symmetrical.

In some of its forms the gyroscope has been known for a very long time, and is, in all probability, of French or German invention. Almost the first instrument of the kind that we hear of, and of which the present gyroscope is merely a modification, is that of Bohnenberger, which was constructed as early as 1810, and is described in Gilbert's *Annalen* for 1818 (lx. p. 60). It consisted of a heavy spheroid which could rotate inside a circular ring round its shorter axis,—the axis running on pivots situated at opposite ends of the ring's diameter. This ring, with its contained spheroid, was similarly made movable inside a second ring, and round an axis at right angles to the axis of the spheroid. In the same way this second ring, with its contents, could rotate inside a third ring, and round an axis at right angles to each of the others. From this it will be seen that the spheroid had all degrees of free rotation,—one point only within it being fixed, namely, the intersection of the three axes.

Under the title of precession instruments, various pieces of apparatus, involving the gyroscope principle, have been in use for a number of years for illustrating the precession of the equinoxes, and the parallelism of the earth's axis as it revolves round the sun. An instrument of this kind was given by Arago to Professor Playfair, which must have been in existence since 1816–17. Mention is made of a similar instrument as being brought from Italy to Mr Babbage in 1827. At the close of that year a notice of an instrument akin to the gyroscope made by Mr Henry Atkinson was read before the Astronomical Society. In 1836, in a paper read before the Royal Scottish Society of Arts, Mr Edward Sang, C.E., Edinburgh, suggested an experiment with an instrument exactly similar to the gyroscope, by which the rotation of the earth on its axis could

be directly proved. He says: "While using Troughton's top an idea occurred to me that a similar principle might be applied to the exhibition of the rotation of the earth. Conceive a large flat wheel, poised on several axes all passing exactly through its centre of gravity, and whose axis of motion is coincident with its principal axis of permanent rotation, to be put in very rapid motion. The direction of its axis would then remain unchanged. But the directions of all surrounding objects varying, on account of the motion of the earth, it would result that the axis of the revolving wheel would appear to move slowly." This suggested experiment was actually carried out in 1852 by M. Leon Foucault, although, in all probability, without any knowledge on his part of Mr Sang's suggestion. Already, in 1851, Foucault, in his famous experiment with the pendulum at the Pantheon in Paris, had shown how the constancy of the plane of a pendulum's vibration could be used to show the rotation of the earth, and now, in 1852, he applied the property of the "constancy of the plane of rotation" of a gyroscope for the same purpose. The name gyroscope was given to the instrument by Foucault at this time, and in order to perform the experiment successfully the instrument had to be constructed with the utmost exactness. The experiment was repeated at the Liverpool meeting of the British Association, and by causing a considerable sensation in the scientific world at the time was the means of bringing the gyroscope into public notoriety. In *Poggendorff's Annalen* for 1853 there is a description of a gyroscope made some time before by Fessel, and about the same time we hear of various modifications of the instrument introduced by Profs. Baden Powell, Wheatstone, and others. Quite recently, in 1878, there has appeared in the *Scientific American* an account of a new form of gyroscope made by Mr G. M. Hopkins. In this instrument the heavy fly-wheel is driven by an electric current after the manner of an electromagnetic engine, and so its rotation can be kept up for any length of time.

Fig. 1.

The construction of the gyroscope will be readily understood from fig. 1, which is engraved from a photograph of a large instrument made by Mr Sang.

It consists of a fly-wheel, with a heavy rim accurately turned and balanced, which can rotate round an axis GC forming a diameter of the ring K. This ring also can rotate about the axis AF which is at right angles to GC, and is a diameter of the ring L. Similarly this ring L can rotate about the vertical axis BH, which is perpendicular both to GC and AF, and forms a diameter of the ring M, which is screwed to the heavy sole-plate N. In order to suit certain experiments the ring M, by means of a clamp arrangement seen at X, can be turned round to make the axis BH inclined at any angle with the vertical. With this instrument the following among many interesting experiments may be made.

1. Either by a large fly-wheel and band, or by running out a long cord coiled several times round the V-grooved wheel on the end of the axis, let a very rapid rotation be given to the fly-wheel round the axis OC, and in the positive direction (that is, counter-clock-wise as seen from C). Such a rotation can readily be given so rapid as to last a long time. While so revolving let a weight be placed at G so as to cause a rotation round OA, also in the positive direction, and it will then be observed that a slow rotation of the whole mass takes place about the vertical axis OB, but in the nega-

tive direction. If the weight be put at C, the wheel rotating as before, the rotation round OB will be in the positive direction. Reversing the rotation of the wheel will in both cases produce a reversal of the rotation round OB.

2. The fly-wheel still rotating in the positive direction, let a positive rotation be given to the ring L round OB, and immediately the axis of the wheel OC will tilt up, rotating in the positive direction round OA till it reach the vertical position, where it will remain, and then it will be observed that the fly-wheel is rotating in the positive direction round OB. Should the axis OC, in consequence of inertia, be carried a little past the vertical, and the direction of rotation round OB be then suddenly reversed, the axis OC will continue to revolve in the positive direction round OA, till it reaches the vertical pointing downwards, when it will again be stationary, and the wheel will now be rotating in the negative direction round OB. By gently oscillating the ring L at the instant the axis of the fly-wheel is passing the vertical, a continuous rapid rotation round OA can be given to the ring K carrying the rotating fly-wheel with it.

3. Let the fly-wheel be now made stationary, and, while in this position, let simultaneous rotations in the positive direction be given round both OA and OB; the fly-wheel will then be observed to begin to move in the negative direction round OC.

The explanation of all these experiments follows readily from the theory of the composition of rotations round different axes. Let the angular velocities about OA, OB, OC, be ω, ρ, σ respectively. If simultaneous angular velocities σ and ω be given about OC and OA in the positive direction, these can be compounded into an angular velocity about a new axis OI, which divides the angle AOC into two parts such that

$$\frac{\omega}{\sigma} = \frac{\sin COI}{\sin AOI} = \frac{\sin COI}{\cos COI} = \tan COI = \tan \theta \text{ (suppose).}$$

OI is, therefore, the position of the instantaneous axis, and as OC will always tend to coincide with it, OC will move round the axis OB in the negative direction. It will be noticed also that, ω remaining the same, $\tan \theta$ will be less as σ is greater. This shows that the rotation round OB, or the motion in azimuth, will be slower as the speed of the fly-wheel is greater. This accords with experiment. In precisely the same way by considering simultaneous angular velocities about OC and OB and OA and OB, can experiments 2 and 3 be explained.

Perhaps the most common form of gyroscope is that which has been largely sold under the name of the gyroscope top.

It is a modification of the gyroscope introduced by Fessel. In it the ring containing the rotating wheel is either supported on a vertical pivot at the end of the axis, or simply held suspended by a string attached to the same point, as represented in fig. 2.

Fig. 2.

In this case, when the wheel is, rapidly rotated, and its axis initially inclined at an angle with the vertical, a slow motion round the vertical axis is observed to take place. This

rotation is accompanied by a feeble nutation of the axis, which is unobservable by the eye so long as the wheel rotates rapidly. The rotation in azimuth would continue uniform if the velocity of the wheel remained constant, but it gradually increases in speed, the nutation at the same time becoming more apparent as the velocity dies away, till the gyroscope finally settles with the axis of the wheel in the direction of the

Fig. 3.

becoming more apparent as the velocity dies away, till the gyroscope finally settles with the axis of the wheel in the direction of the

prolongation of the supporting string. A short analytical investigation of this particular case may serve to give some idea of how problems on the gyroscope generally may be attacked. For clearness in the woodcut (fig. 3) we suppose the ring containing the wheel removed.

Let K represent the wheel of mass M; h the distance of the centre of gravity G from O; OC the axis of the wheel, supposed of unit length; OA, OB, two other axes through the fixed point O at right angles to OC and to each other; OX, OY, OZ, three rectangular axes fixed in space, with which OA, OB, OC (axes movable with the body) initially coincide; ψ, ϕ, θ , angles on the unit sphere which define the point C.

If A, B, C be the moments of inertia, and ω, ρ, σ the angular velocities about OA, OB, OC respectively, the equation of kinetic energy T gives

$$T = \frac{1}{2}(A\omega^2 + B\rho^2 + C\sigma^2);$$

$$\omega = \dot{\psi} \sin \phi - \dot{\psi} \sin \theta \cos \phi;$$

$$\rho = \dot{\psi} \cos \phi + \dot{\psi} \sin \theta \sin \phi;$$

$$\sigma = \dot{\psi} \cos \theta + \dot{\phi}.$$

but

Substituting and making $A = B$, as is clearly the case, we have

$$T = \frac{1}{2}A\dot{\theta}^2 + \frac{1}{2}A\dot{\psi}^2 \sin^2 \theta + \frac{1}{2}C(\dot{\psi} \cos \theta + \dot{\phi})^2.$$

Applying Lagrange's equations of motion, which are for this case

$$\frac{d}{dt} \cdot \frac{\partial T}{\partial \dot{\psi}} - \frac{\partial T}{\partial \psi} = 0,$$

$$\frac{d}{dt} \cdot \frac{\partial T}{\partial \dot{\phi}} - \frac{\partial T}{\partial \phi} = 0,$$

$$\frac{d}{dt} \cdot \frac{\partial T}{\partial \dot{\theta}} - \frac{\partial T}{\partial \theta} = Mgh \sin \theta,$$

we get

$$(1) \frac{d}{dt} \left\{ A \dot{\psi} \sin^2 \theta + C(\dot{\psi} \cos \theta + \dot{\phi}) \cos \theta \right\} = 0;$$

$$(2) \frac{d}{dt} \left\{ C(\dot{\psi} \cos \theta + \dot{\phi}) \right\} = 0;$$

$$(3) A\ddot{\theta} - A\dot{\psi}^2 \sin \theta \cos \theta + C \sin \theta \ddot{\psi} (\dot{\psi} \cos \theta + \dot{\phi}) = Mgh \sin \theta.$$

Integrating (2), we get

$$\dot{\psi} \cos \theta + \dot{\phi} = a \text{ constant} = n,$$

which represents the angular velocity about OC.

Now if the motion be steady we must have both θ and ψ constants. Let them be represented by α and μ respectively. Then equation (3) gives

$$-A\mu^2 \sin \alpha \cos \alpha + C\mu n \sin \alpha = Mgh \sin \alpha.$$

$$\therefore \mu = \frac{Mgh + A\mu^2 \cos \alpha}{Cn}.$$

By this formula we can calculate, for any particular instrument, the angular velocity in azimuth from having given the angular velocity of rotation of the fly-wheel and *vice versa*.

An important case of motion, and one also very interesting both mathematically and physically, is got by including a gyroscope in a pendulum bob and supporting the rod from a universal flexure joint. This constitutes the gyroscopic pendulum. The joint is usually got by attaching a short length of fine steel wire rigidly to the end of the rod, and suspending the whole by means of the other end of this wire firmly clamped into a fixed support. When the gyroscope is rapidly rotated, and the pendulum drawn a little aside from the vertical and then let go, its lower end is observed to describe a beautiful curve consisting of a series of equal closed loops, all equally near each other and radiating from a centre point. This curve, which is a species of hypotrochoid, is figured in Thomson and Tait's *Natural Philosophy*, where also the whole theory of the gyroscopic pendulum will be found.

As has been already mentioned, a remarkable apparent effect is produced by the earth's diurnal rotation upon a rapidly rotating gyroscope. This arises from what Foucault called the "fixity of the plane of rotation," and what Thomson and Tait have recently called "gyrostatic domination." In virtue of this principle, the axis of the rotating fly-wheel tends always to preserve a fixed direction in space, and, in consequence, will appear to move in a direction opposite to that in which the earth's rotation is at each instant actually carrying it.

If we suppose the gyroscope represented at fig. 1 to have all degrees of free rotation round the point O, and to be in every way exactly balanced about that point, and also to have all its pivots

nearly void of friction, then, at whatever part of the earth's surface it may be placed, the fly-wheel while rotating rapidly will be observed to move gradually and finally take up such a position that its axis OC is parallel to the earth's axis, and also that its direction of rotation round OC is the same as that of the earth round its axis. Should the ring K be fixed so that the axis GC can only move in a horizontal plane, then the ring L will move in azimuth till it has placed GC in the direction north and south and such that the direction of rotation of the fly-wheel coincides with that of the earth. Further, should the ring L be fixed in the plane of the meridian, so that GC can only move in altitude, then GC will be observed to tilt up till it is parallel to the earth's axis, the direction of rotation of the wheel being, as before, the same as that of the earth. These effects may be explained as follows:—

Let λ be the latitude of the place, and ω the angular velocity of the earth on its axis; also, at starting, let the ring K be in the horizontal plane, and let OC make an angle α , in azimuth, with a horizontal line ON drawn from O northwards; further, let the rotation of the wheel round OC be positive. Now ω can be resolved into three angular velocities at right angles to each other, viz.:—

$$\omega \sin \lambda \text{ round the vertical line,}$$

$$\omega \cos \lambda \cos \alpha \text{ round a line parallel to OC, and}$$

$$\omega \cos \lambda \sin \alpha \text{ round a line parallel to ON.}$$

Of these $\omega \sin \lambda$ gives the velocity in azimuth, $\omega \cos \lambda \cos \alpha$ can only affect the velocity of the wheel, while $\omega \cos \lambda \sin \alpha$ gives the velocity of OC in altitude. These being the actual component velocities communicated to the gyroscope by the earth, the apparent velocities will be equal and opposite to them.

The apparatus actually employed by Foucault to demonstrate the rotation of the earth differed somewhat from that represented in fig. 1. In it the corresponding ring to L was suspended from a fixed stand by a thread without torsion, and rested at its lowest point by a pivot in an agate cup. Also the ring corresponding to K, which carried the fly-wheel, rested on knife edges within L, and could be removed at pleasure, in order that the rotation might be given to the fly-wheel. Great care was also taken to have every part thoroughly well balanced. It is stated that the experiment was several times successfully performed, and Foucault by means of his apparatus was thus able, without astronomical observation, to find out the latitude of the place, the east and west points, and the rate of the earth's motion. The same experiment has lately, it is said, been successfully performed by Mr G. M. Hopkins. His fly-wheel, being driven by electricity, has the advantage of rotating at a uniform rate for any length of time. By attaching a small mirror to the frame which carries the revolving wheel, and using a spot of light reflected from it as an index, he has been able to make manifest the earth's rotation in a very short time.

An ingenious practical application of the gyroscope principle was suggested and carried into effect about the year 1856 by Professor Piazzi Smyth. His aim was to devise a telescope-stand which would always remain level on board ship, notwithstanding the pitching and rolling, and so facilitate the taking of astronomical observations at sea. For this purpose the stand was supported on gimbals, and underneath it were placed on fine pivots several heavy fly-wheels which could be put in rapid rotation, some vertical and some on horizontal axes. The complete apparatus, involving many ingenious details as to driving the fly-wheels, &c., was tested by Professor Smyth on board the yacht "Titania" during a voyage to Teneriffe, and found to work with perfect satisfaction. A full account of the method will be found in *Trans. Royal Scottish Society of Arts*, vol. iv.

GYROSTAT.—This is a modification of the gyroscope, devised by Sir William Thomson, which has been used by him as well as by Professor Tait for a number of years to illustrate the dynamics of rotating rigid bodies. It consists essentially of a fly-wheel, with a massive rim, fixed on the middle of an axis which can rotate on fine steel pivots inside a rigid case. The rigid case exactly resembles a similarly-shaped, but hollow, fly-wheel and axis closely surrounding the other but still leaving it freedom to move. Slits are made in the

containing case whereby a cord can be coiled several times round the axis for the purpose of setting the fly-wheel in motion. There is also attached to the rigid case, in the plane passing through the centre of gravity of the wheel at right angles to its axis, a thin flange of metal, which is called the bearing edge. The circumference of this flange is not a circle but a curvilinear polygon of sixteen or more equal sides. The object of making it so is to prevent the instrument from rolling like a wheel on the bearing edge when the fly-wheel is rotating rapidly. A drawing of the gyrostat, with a portion of the case removed to show the inside, is given in fig. 4. A represents the bearing edge upon which the whole balances. To suit certain experiments, a sharp conical steel point can be fixed on to the end B by means of a bayonet joint.

Fig. 4.

The gyrostat is a most instructive instrument, and with it many interesting experiments can be performed. We can only mention a few taken from Thomson and Tait's *Natural Philosophy*, vol. i. Part I., where the mathematics of the whole subject will be found fully given.

1. Let the gyrostat be placed on a flat sheet of glass with its bearing edge in a vertical plane as represented in the figure. Neglecting translations, it has in that position clearly two freedoms, one in azimuth and the other inclinational. Of these, the first is neutral and the second unstable when the fly-wheel is still; but when it rotates rapidly the second will become stable, the first remaining neutral as before. When the fly-wheel is spinning rapidly, the persistence with which the gyrostat keeps the erect position is very remarkable. A blow from the fist on the side of the case is met by a strong resistance, the instrument being thrown into a state of violent tremor, which subsides, however, after a few seconds. If, while the fly-wheel is still rapidly spinning, a weight be hung on at B, the whole apparatus will, like the gyroscope, immediately begin to move round a vertical axis.

2. Let the gyrostat be supported on knife-edge gimbals at its lower end, and with the axis vertical. In this position it has two freedoms each unstable, without rotation of the fly-wheel, but with it both stable. A similar result is obtained by supporting the gyrostat on a universal flexure joint, constituting an inverted gyroscopic pendulum.

3. Let the gyrostat be supported on two equally long stilts tangential to the bearing edge. In this position the two freedoms, one azimuthal the other inclinational, are both unstable without, but both stable with, rapid rotation of the fly-wheel.

4. Let the gyrostat be attached to a bar of wood by thrusting the bearing edge through a narrow slot in the middle of the bar, and then let it be suspended by strings attached to the ends of the bar, the bar being horizontal. By this we have the means of slinging the gyrostat bifilarly in four different ways, two with the strings parallel and two with them crossed, the gyrostat being alternately above and below the wooden bar. Each of these ways has four freedoms, which can be reduced to three by a third string in each case. A little consideration will show in each case the stable and unstable modes without and with rotation of the fly-wheel.

It only remains to mention a very interesting and intricate gyrostatic problem which has been lately suggested by Sir William Thomson. He supposes a string of gyrostats to be formed with their axes all in the same straight line, and each attached to the other by a small universal flexure joint of thin steel wire. If this string be disturbed after the fly-wheels have all been put into rapid rotation, a remarkable cork-screw motion passes along the wire. For particulars we must refer to a paper announced by Sir William Thomson in the *R.S.E. Proceedings*.

GYTHIUM was an ancient Achæan town on the Laconian Gulf, south-west of the mouth of the Eurotas, near the site of the modern port Marathonisi. It lay opposite the island Craux, at the foot of the fertile valley of the Gythius. On its coins the common types are Apollo and Heracles, the founders of the city. Heracles, the Phœnician god Melkart, points to an early connexion with Tyre. The Phœnicians maintained a great trade with the shores of the Laconian Gulf, and Aphrodite Migonitis, the Phœnician Astarte, had a temple at Migonium, the modern Marathonisi. Aphrodite and Asclepius also occur on its coins, and the latter had a temple in the city. A great port in the period of Phœnician intercourse, Gythium became a secondary town after the Dorian conquest, as is proved by the absence of early coins; and it was only after the decay of Sparta that it again became an important city. It was the ordinary station of the Spartan fleet, and was considered the port of Sparta, from which it was distant about 30 miles. In the wars against Athens it was therefore exposed to frequent attacks. Themistocles, the Athenian commander, burned it (455 B.C.). Later it was besieged unsuccessfully by Epaminondas (370 B.C.). It was strongly fortified by the tyrant Nabis; but he was compelled by Flaminius to give up Gythium and other coast towns to the Achæan league (195 B.C.). When, soon afterwards, the whole country became a Roman province, Gythium had its own magistrates, *στράταιοι* and *ἑφοροί* (see inscr. in Lebas, *Voyage Archéol.*, 242a, and *Gött. Gel. Anz.*, 1865, p. 461). Augustus made it one of the twenty-four Eleuthero-Laconian towns. The existing ruins, called Paleopoli, are all of the Roman period. According to Strabo (p. 363), it had an artificial harbour, of which Col. Leake could see no trace. In the town was a well sacred to Asclepius, and at three stades distance was the stone Argos, where Orestes was relieved from his madness.

GYULA, chief town of the Trans-Tibiscan county of Békés, Hungary, is favourably situated on the Fehér (White) Körös, and has a well-built station on the Nagy-Várád (Grosswardein) and Eszék line of the Alföld-Fiume Railway, in 46° 38' N. lat., 21° 17' E. long. The outer ditch of the old ruined fortress, the tower of which serves as a prison, divides Gyula into two parts, named respectively Magyar-Város (Hungarian-town) and Német-Város (German-town). Stone bridges facilitate communication over the canals, which flow from the Körös, and intersect the streets. Among the principal buildings are Roman Catholic, Old United Greek, Lutheran, and Calvinist churches, and a Jews' synagogue, also a fine castle with gardens, a county hall, an ancient Turkish bath, many handsome private residences, and several oil-mills. Gyula is, moreover, the seat of the county assemblies and administration, of a royal court of justice, of the assizes, and of a board of taxes, and has post and telegraph offices, and a savings-bank. The inhabitants are employed partly in industrial and commercial pursuits, partly in farming and cattle-breeding. The fairs are much resorted to for the purchase of corn, horned cattle, sheep, pigs, wooden wares, and gall-nuts. The chief agricultural products of the surrounding country are wheat, barley, oats, and maize; there is also a good supply of garden fruit, grapes, and vegetables. In 1870 the population amounted to 18,495, consisting chiefly of Magyars, Wallachs, and Germans.

H

H has varied in form from the Phœnician and old Hebrew symbol **𐤀**, called Cheth, only by the removal of the upper and lower horizontal lines. (For the oldest forms of the letter see ALPHABET.) The closed form is sometimes found in old Greek inscriptions, and, though less frequently, in South Italy.

Its value in Phœnicia was probably a continuous guttural sound—the sound which it had in Hebrew—resembling the German *ch*, and with no English counterpart. In Greece it represented nothing more than the spirant *h*, so long as a separate symbol to denote that sound was felt to be necessary. Afterwards it was generally employed to denote a second *e*-sound, under the name of *Eta*; probably it had before been called *Heta*. The time of this change varied in different parts of Greece. In the alphabet of the island of Thera we find H representing *e* as early as the 40th Olympiad, though it still sometimes retained its old value. At Athens the date was 403 B.C., and here the practice did not vary. But in most of the alphabets of Greece proper, of Peloponnesus, and of the Italian colonies, H still remained as the rough breathing; and as such it consequently passed into the Latin alphabet. It is possible that *h* in a very few Latin words, when it occurs as a medial sound (e.g., *traho, veho*), was a continuous guttural. But generally it occurs at the beginning of a word, and can hardly have been more than a breathing. Even as this it early became evanescent. During the classical period of Latin literature it was retained in the speech of educated men, doubtless in part by Greek influence. But in the popular speech it was rapidly disappearing as an initial sound; although it continued to be written, and indeed was often written wrongly, at the beginning of words where it had no place; e.g., *umor* was written *humor*, and the *h* has held its own in English spelling down to our day. The sound is almost completely lost in modern Italian.

It is not settled beyond dispute by what mechanism the *h*-sound is produced. The old view (held by Lepsius and others) is that *h* has a distinct position of its own, further back in the throat than the gutturals, in fact, immediately above the larynx,—that it is a surd, to which the corresponding sonant is the slight gurgle heard between words of which the first ends and the second begins with the same sound (e.g., “go over”), if we take care to close the glottis between the two words but not to alter the position of the other vocal organs. A quite different view is held by Whitney, M. Bell, and others, that *h* has no distinct position of its own, but is sounded in or through the position of the following sound; for example, that in saying *ha* we do not put the vocal organs into two positions, one for *h* and one for *a*, but we put them into the position for *a*, and then produce the breath and the vowel without any change of position, the *h* being a mere expiration of breath through the open glottis; similarly *hi, hu, &c.*, are produced with the vocal organs in the position for *i, u, &c.*, respectively; in each case the vocal chords vibrate for the vowel after the expiration of breath, but there is no change made within the orifice of the mouth between the *h*-sound and the vowel. This view is at least a plausible one.

HAARLEM, a city of the Netherlands, the chief town of the province of North Holland. By rail it is 11 miles W. of Amsterdam, 19 S. of Alkmaar, and 20 N. of Leyden. Distant about 5 miles from the German Ocean, it communicates with the *Zuyder-Zee* by the Spaarne and the Ij. The railway to Amsterdam was opened in 1839, and that to Alkmaar in 1867

Haarlem is a typical Dutch town. The branches of the Spaarne and an extensive system of canals bring the ship-traffic into the heart of it, and turn its streets into so many quays. The roadways are paved with bricks; the houses have gable-ends with old-fashioned crow-steps; and everything wears a decent and quiet aspect, which to one man is dulness and to another “aristocratic gravity and modest coquetry.” What the city lacks in liveliness it makes up by the interest of its historical associations and the number of its scientific and artistic institutions. The great market place especially has much that is worth seeing: the town-house and the cathedral of St Bavo; the old meat market, a building of the end of the 16th century in the old Dutch style; the *stadsdoelen*, or place where in former times the burghesses used to assemble in arms; and the statue erected to Koster in 1856, when in Holland he was still generally considered the inventor of printing. St Bavo's is one of the most famous churches in the Netherlands. It is a cruciform structure completed in 1538, and makes a considerable impression on the spectator by the great length (about 426 feet) of its main axis and the height and steepness of the

Plan of Haarlem.

roof. The tower is about 255 feet high. Within the lofty vaulting is supported by twenty very light columns, and there is a good deal of beauty about the perspective of its aisles. The organ, built by Christian Muller of Amsterdam between 1735 and 1738, was for some time the largest in the world, and is still celebrated for the sweetness of its tone, especially in the *vox humana* stop. It possesses four key-boards, 64 stops, and 5000 pipes, the largest of which is 15 inches in diameter. Among the monuments in the church are those of Bilderdijk the poet and the hydraulic engineers Christiaan Brunings and Fredrik William Conrad, the latter the projector of the sluices at Katwijk. In the belfry are the *damiaatjes*, small bells presented to the town according to tradition by William I., the conqueror of Damietta. At the head of the scientific institutions of Haarlem may be placed the Dutch society of sciences (*Hollandsche Maatschappij van Wetenschappen*) founded in 1752, which possesses very valuable collections in botany, natural history, and geology. Teyler's foundation (Teyler's Stichting), instituted in accordance with the last will of Pietro Teyler van der Hulst for the study of theology, natural philosophy, poetry, history, drawing, and

numismatics, has various auxiliary collections in the founder's former residence. The Dutch society of industry, founded in 1777, is still active and flourishing, with branches established all over the country. In 1871 it instituted a colonial museum, which along with the royal museum of modern art is accommodated in the pavilion formerly the residence of an Amsterdam banker, Hope, and acquired for the crown by King Louis Napoleon. The colonial museum presents a complete survey of the manifold products of the Dutch possessions in the East Indian Archipelago, and the royal museum has a collection of 250 pictures. Among the benevolent institutions of the city it is enough to mention the hospital for old men founded in 1608, and the beautiful Teyler's Hospital.

The staple industries of Haarlem have been greatly modified in the course of time. Under the counts of Holland cloth-weaving and brewing were in a very thriving condition; but under Charles V. they lost enormously in importance. While 2000 pieces of cloth had been manufactured annually in the end of the 15th century, 800 or 900 was the number for 1515; and the breweries diminished from 120 in 1494 to 95 in 1503, and by 1513 were no more than 77. After the revocation of the edict of Nantes, silk, lace, and damask-weaving were introduced by French refugees, and in course of time these industries gave employment to 10,000 of the population. About the close of the 18th century this remarkable prosperity was a thing of the past; and it was not till after the Belgian revolution that Haarlem began to turn its attention to the various departments of manufacture in which it is now engaged. Cotton factories, carriage-works, bleach-works, cotton and silk dye-works, a famous type-foundry, oil-works, soap-works, breweries, and a factory for preserved meats are among the more important establishments. The extensive workshops of the Dutch railway company are also of value to the town. One of the printing establishments has the reputation of being the oldest in the Netherlands, and publishes the oldest Dutch paper, *De Opragte Haarlemmer Courant*. As market gardening, especially in the flower department, is largely carried on in the immediate vicinity, Haarlem is the seat of a flourishing trade in "Dutch roots," especially in hyacinths, tulips, fritillaries, spiræas, and japonicas. A considerable business is also done in the butter, cheese, and other agricultural produce from the surrounding country.

Though the population of Haarlem has been steadily increasing since the beginning of the present century, it has not become so great as it was in the 17th. In 1570 the total was 20,772 souls, of whom 1836 were Dutchmen capable of bearing arms, 1215 Englishmen and Frenchmen, 1856 Germans, and 15,865 women and children. By 1622 it had increased to 39,455. A rapid decline took place in the 18th century; from 26,281 in 1748 the number sank to 21,227 in 1796, and by 1815 it was not more than 17,432. Seven years later we find 18,453 inhabitants, 21,667 in 1830, 24,012 in 1840, 25,852 in 1850, and 27,534 in 1860. The year 1874 showed 32,758, and three years later the number was no less than 35,692. In 1869-1870 there were 14,471 members of the Dutch Reformed Communion, 11,574 Roman Catholics, and 565 Jews.

Haarlem is mentioned in a register of the 10th century as Haralem. From Count William II. it obtained a charter in 1245, and in the course of the following centuries it rapidly advanced in prosperity. In 1492 the insurgents called the "bread and cheese folk" got possession of the town, but before the year was out it was recovered by the imperial general Duke Albert of Saxony. The year 1493 was witness of a great conflagration, and in 1509 the plague claimed its many victims. In 1559 Haarlem became a bishop's see. The prominent part that its inhabitants took in the revolt of the Netherlands brought upon it an unparalleled disaster. Don Frederick son of the duke of Alva invested the town with 30,000 men in December 1573, and after a siege, in which the burghers defended themselves with admirable and pertinacious heroism, it was obliged

to capitulate in July 1573. The conquerors, in spite of their promise of mercy, took barbarous vengeance, and it was not till July 1677 that the town was recovered from their grasp by the prince of Orange. In its subsequent history the main events are the inundations of 1775 and 1791, the arrival of the Prussians in 1787, and the quatercentenary celebration of the invention of printing in 1823.

See F. Allan, *Geschiedenis en beschrijving van Haarlem van de vroegste tijden tot op onze dagen onder medewerking van Ekeme, Enschede, en Geelings*.

HAARLEM LAKE, or HARLEMMER MEEER, a commune of the province of North Holland, constituted by the law of 16th July 1855. It has an area of about 46,000 acres, and its population has increased from 7000 in 1860 to 13,602 in 1878. As its name indicates, the commune was formerly a lake, and, according to Amersfoort, this lake was a relic of a northern arm of the Rhine which passed through the district in the time of the Romans. In 1531 the Haarlemmer Meer had an area of 6430 acres, and in its vicinity were three smaller sheets of water—the Leidse Meer or Leyden Lake, the Spiering Meer, and the Oude Meer or Old Lake—with a united area of about 7600 acres. The four lakes were ultimately incorporated into one by successive inundations, and by 1647 the new Haarlem Lake had an area of 36,400 acres, which by 1740 was increased to 42,000. As early as 1643 Jan Adriaanszoon Leeghwater proposed to endyke and drain the lake; and similar schemes, among which those of Nikolaas Samuel Crnquius in 1742 and of Baron van Lijnden van Hemmen in 1821 are worthy of special mention, were brought forward from time to time. But it was not till 1836, when one furious hurricane on the 9th of November drove the waters as far as the gates of Amsterdam, and another on the 25th of December sent them in the opposite direction to submerge the streets of Leyden, that the mind of the nation was turned seriously to the matter. In August 1837 the king appointed a royal commission of inquiry; the scheme proposed by the commission received the sanction of the second chamber in March 1839, and in the following May the necessary law was passed. The first business was to dig a canal round the lake for the reception of the water and the accommodation of the great traffic which had previously been carried on. The canal was made 38 miles in length, with a depth of 9 feet, and a width of 130 feet on the west side of the lake and 115 feet on the east side. The preliminary works were not completed till 1845. The area enclosed by the canal was rather more than 70 square miles; the average depth of the lake was 13 feet 1.44 inches; and as the water had no natural outfall it was calculated that probably 5000 million tons would have to be raised by mechanical means. A gigantic steam-engine designed by Messrs J. Gibb and A. Dean of London was erected and named in honour of Leeghwater. It could raise 112 tons at each stroke and discharge 1,000,000 tons in 25½ hours. The total weight of iron used for the engine, pumps, &c., was 640 tons, and the cost of the machinery and buildings amounted to £36,000. Two other engines of equal size and power were afterwards constructed by Messrs Harvey of Hayle and Messrs Fox and Co. of Perran, in Cornwall, the makers of the "Leeghwater." They were named respectively the Crnquius and the Van Lijnden. Pumping commenced in 1848, and the lake was dry by the 1st of July 1852. At the first sale of the highest lands along the banks on August 16, 1853, 784 hectares were bought for 575,000 florins, or 733 florins per hectare; but the average price afterwards was less. The whole area of 42,000 acres recovered from the waters has brought in 9,400,000 florins or about £780,000, so that the actual cost to the nation has only been 4,400,000 florins or £300,000, though the expense of the enterprise amounted to 13,787,377 florins or £1,080,000. The soil is of various kinds, loam, clay, sand, and peat; most of it is sufficiently fertile, though in the lower portions there are barren patches where the scanty vegetation is covered with an ochreous deposit. Corn, seeds, cattle, butter, and cheese are the principal produce. The roads which traverse the commune are bordered by pleasant-looking farm-houses built after the various styles of Holland, Friesland, or Brabant. Hoofdorp, Vennepdorp or Nieuw Vennep, Abbene, and the vicinities of the three great steam-engines are the spots where the population has clustered most thickly. The first church was built in 1855; in 1877 there were seven. In 1854 the city of Leyden laid claim to the possession of the new territory, but the courts decided in favour of the nation.

A list of works on the Haarlem Lake is given by Gevers van Endegeest, *Du dessèchement du Lac de Harlem* (The Hague, 1849-1861, 3 parts, with plates). See also J. P. Amersfoort, *Het Haarlemmermeer*, Haarlem, 1857, published by the Amsterdam *Maatschappij Felix Meritis*.

HABAKKUK (חִבְקִיָּא), one of the minor prophets of the Old Testament, the eighth in order in the Massoretic text. The name of the prophet is peculiar to him, and occurs only in his own writing (i. 1; iii. 1). As to its meaning there is some uncertainty, but it is probably a formation from a verb signifying to *entwine*, to *embrace*,

(חֲבַקּוּךְ), and means "embraced" or simply "embrace" (Jerome, *Pr. ad Hab.*; Gesenius and Fürst on the word). In the Septuagint and with the Greek fathers it appears in the form of Ἀμβακούμ, which would seem to indicate that the Hebrew was read and pronounced Habbākuk (חֲבַקּוּךְ), the double *b* being changed for the sake of euphony into *mb*. The change of the *k* into *m* at the end of the word Bleek says is without analogy; but in the change of Beelzebub into Beelzebul we have an analogous instance of the substitution of a liquid for a mute,—probably because to the Greek ear it was not agreeable that a final syllable should begin and end with the same rough consonant. Of the prophet's personal history nothing is certainly known. In the inscription of his book he is simply called "the prophet"; nor can we with certainty determine at what time he lived and prophesied. From the use of the word "my" in the subscription to the psalm in chap. iii., "To the chief singer on my stringed instrument" (ver. 19), it has been inferred that he was of the tribe of Levi, inasmuch as it is supposed from this that he held a place among those by whom officially the musical service of the temple was conducted, a place which only a Levite, it is alleged, could occupy. But this seems rather too much to build on the mere use of the word "my," nor is it quite certain that only Levites took part with stringed instruments in the service of song in the temple. King Hezekiah, after his recovery from his sickness, composed a psalm of thanksgiving, and in reference to it he says, "We will sing my songs to the stringed instruments all the days of our life in the house of the Lord"; for he "had said, What is the sign that I shall go up to the house of the Lord?" (Isa. xxxviii. 20, 22); from which it may be inferred that others besides Levites might take part in the liturgical music of the temple. Were there any truth in the assertion in the additions to Daniel in the Apocrypha that Habakkuk was sent by the Lord from Judæa to Babylon with food for Daniel in the lions' den, this would give us the date of the prophet's activity; but on such a manifest fiction nothing can be built. According to one tradition the prophet was buried at Keilah in the tribe of Judah; according to another at Hukkok (now Yakuk) in the tribe of Naphtali.

The book of Habakkuk falls into two parts,—the former of which (chaps. i. and ii.) has the inscription, "The burden which Habakkuk the prophet saw," and the latter (chap. iii.) the inscription, "Prayer" (or hymn) "of Habakkuk on Shigyonoth." Both parts have reference to the same subject, the invasion of Judah by the Chaldeans, who are expressly named (i. 6). In both this is regarded as a chastisement from the Lord upon the people for their sins; but whilst in the earlier part the prophet appears as a reprover and denouncer of evil, in the latter he gives utterance to emotions of reverence, confidence, and joy in God as the Saviour of His people. In the former part the prophecy is in the form of a dialogue between Jehovah and the prophet. The prophet, deeply troubled because of the corruption of his people, cries to God and asks how long such a state of things is to continue (i. 2-4); to which God replies in effect that He is about to bring on the sinful nation a heavy calamity by rising against them the Chaldeans—"that bitter and impetuous nation"—whose fierce and terrible hosts should devastate the land,—at the same time intimating that this scourge should pass away, and that the invaders, though the instruments of God's vengeance, should not be held guiltless (5-11). The prophet then appeals to God, the Everlasting and Holy One, and asks how the employment of such instruments to inflict punishment on the people of His choice is reconcilable with the divine rectitude and unchangeableness (12-17), but declares that he will stand on his watch-tower that he may learn what God will say to him, hoping that some word of comfort may be vouch-

safed to him which he may carry to his people. The word comes; the Lord will not suffer the ungodly, the transgressor, and the idolater to escape; a five-fold woe is denounced against the enemies of God's people; the just are encouraged to abide in faith, cheered with the assurance that as a result of God's judgments on the wicked the knowledge of the glory of the Lord shall fill the earth as the waters cover the sea; for God is in His holy temple, His purposes shall stand fast, therefore let all the earth be still and await His coming (ii. 1-20). The latter part of the book is a hymn of praise in which the prophet in his own name and that of the people celebrates the majesty and mighty deeds of the Lord, and gives exulting expression to the confidence and joy with which His true subjects rest in Him (iii. 1-19). This hymn is in form and style like one of the Psalms, and was doubtless intended for use in the temple service. To some it has appeared that this third chapter is wholly unconnected with the two preceding. But though different in character and style, it stands closely connected in substance with what goes before, and forms with this one whole. In the former part we have the burden which the prophet had to bear to the people; in the latter we have the utterance of the feelings produced by the contemplation of the facts and revelations therein set forth, viewed in the light of God's manifestations of Himself on behalf of His people in former times.

This book, which it is generally agreed was written by the prophet himself, forms one of the finest remains of ancient Hebrew literature. In conception and style it is not inferior to any production of the most flourishing age of prophecy. The language is pure, the thought is lofty, and in the construction artistic skill is displayed. With the mantle of the prophet the author bears also the chaplet of the poet.

At what time Habakkuk prophesied remains uncertain. From i. 5, 6, where the invasion of Israel by the Chaldeans is represented as a thing so strange as to be incredible when announced, it has been inferred that the prophecy was uttered whilst as yet the people of Israel were unacquainted with the Chaldeans as a warlike power,—long, therefore, before the battle of Carchemish (606 B.C.), in which Necho, king of Egypt, was defeated by Nebuchadnezzar. The date of the prophecy has accordingly by some been relegated to the reign of Manasseh; and this has been supposed to receive confirmation from the fact that during that reign there were prophets who foretold the coming on the nation of a calamity such as that the ears of all who heard of it should tingle (2 Kings xxi. 10 ff.); and of these prophets Habakkuk may have been one. The words of the prophet, however, do not necessarily imply that at the time he uttered his prophecy the people were so ignorant of the Chaldeans that they could not believe what he was commissioned to announce to them regarding an invasion of the country by that "bitter and hasty" nation; it is rather the immediateness and terribleness of the catastrophe which he represents as what would pass belief, even when announced by a prophet of the Lord. It is further to be observed that his words imply that the calamity he was sent to announce would happen in the days of those to whom he spoke, which could hardly be said of a generation that had reached adult age during the latter half of Manasseh's reign, that is, fully sixty years before the invasion of Judah by Nebuchadnezzar. It may be added that it is very improbable that during the reign of Manasseh, when idolatry had to such an extent superseded the worship of Jehovah, such a psalm as that of chap. iii. would have been composed for the temple service by any one living in Judah. A later date, it would thus appear, must be assigned to the prophecy. Vitringa has suggested that it was uttered in the time of Josiah, and this is accepted by Delitzsch and others. To this it has been objected that the state of things described in the beginning of the book does not accord with what we know to have been the state of things in Josiah's reign, and moreover that the declaration that the calamity threatened should happen in the days of the existing generation does not tally with the assurance given by the prophetess Huldah to King Josiah, that the evil the Lord was about to bring upon Jerusalem should not happen in his day (2 Kings xxii. 15-20). Neither of these objections, however, has much weight. To the former it may be replied that, though in the latter part of Josiah's reign a better state of things than that described by the prophet prevailed, in the early part of it things were probably exactly such as he represents; and to the latter it may be

replied that the two declarations are not irreconcilable, for though the invasion of the Chaldeans might happen in the time of the existing generation to whom the prophet spoke, it might be not till after the death of Josiah that Jerusalem should be taken; which in point of fact was the case. A more serious objection is that the psalm in chap. iii. could not have been composed in the early part of Josiah's reign before the reforms which he introduced had been begun, and that the first and second chapters could not have been uttered after these had been inaugurated, because then the state of things there described did not exist. To meet this it has been suggested that the two parts of the book may have been composed at different times, the earlier part in the beginning and the later after the middle of Josiah's reign. This is possible; but the standpoint of the prophet is in both parts so much the same that it is not probable that any marked interval of time elapsed between the composition of the two. We are, however, so imperfectly acquainted with the minutest details of the history of the times that for aught we can tell there may have been seasons during the reign of Josiah when the good and the evil in the nation were so mixed that a prophet, whilst denouncing the wickedness he saw around him, and threatening a woe on the nation because of it, might yet be inspired by the remembrance of God's dealings with his people in the past and the hope of better things for the future to give utterance to such a strain of adoration and exultant gladness as the hymn at the close of the book presents; nor is there any reason to doubt that the pious king and such men as Hilkiah the high priest, and those associated with him as "rulers of the house of God" (2 Chron. xxxv. 8), would be so in sympathy with the prophet in this that they would readily approve of his psalm being consigned to "the chief singer" to be used in the temple service. An argument in favour of assigning the date of this prophecy to the reign of Josiah has been drawn from the numerous coincidences in sentiment and phraseology between this book and those of Jeremiah and Zephaniah (cf. Hab. i. 8 with Jer. v. 6, iv. 13, and Zeph. iii. 3; Hab. i. 13 with Jer. xii. 1; Hab. ii. 9 with Jer. xlix. 16; Hab. ii. 13 with Jer. li. 58; Hab. ii. 16 with Jer. xxv. 27; Hab. ii. 20 with Zeph. i. 7, &c.); and if in these instances Jeremiah and Zephaniah have imitated Habakkuk or quoted from him, the argument must be held conclusive, for both these prophets began to prophesy in the later part of the reign of Josiah. De Wette, Hitzig, Ewald, Bleek, and others assign the prophecy to the reign of Jehoiakim; but for this there seems no good reason. (W. L. A.)

HABEAS CORPUS, in English law, is a writ issuing out of one of the superior courts, commanding the body of a prisoner to be brought before the court. There are various forms of this writ, according to the purposes for which it is intended. Thus *habeas corpus ad respondendum* is to bring up a prisoner confined by the process of an inferior court in order to charge him with a fresh action in the court above. Other forms are *ad satisfaciendum* (when judgment has been had against a prisoner in the court below), *ad faciendum et recipiendum*, or *cum causa* (to remove the proceedings into the superior court, the defendant being under arrest), *ad testificandum* (when the prisoner is wanted as a witness), &c. These forms are now of little or no importance. The most famous form of the writ is the *habeas corpus ad subjiciendum*,—the well-known remedy for the violation of personal liberty. It is addressed to the person in whose custody another is detained, and commands him to bring his prisoner before the court, with a statement of the day and cause of his capture and detention,—"*ad faciendum, subjiciendum, et recipiendum*, to do, submit to, and receive whatsoever the judge or courts awarding the writ may consider on that behalf." It is described as a high prerogative writ, *i. e.*, it is one of a number of extraordinary remedies, such as *mandamus*, prohibition, and the like, which the courts may grant on proper cause being shown. The writ of *habeas corpus* issues only after motion before the court or application to a judge, made on a sworn statement of facts setting up at least a probable case of illegal confinement. It is a common-law writ. "From the earliest records of the English law," says Hallam, "no freeman could be detained in prison except upon a criminal charge or conviction, or for a civil debt. In the former it was always in his power to demand of the Court of King's Bench a writ of *habeas corpus ad subjiciendum*, directed to the person detaining him in custody, by which he was enjoined to bring up the body of the prisoner with

the warrant of commitment that the court might judge of its sufficiency and remand the party, admit him to bail, or discharge him, according to the nature of the charge. The writ issued of right, and could not be refused by the court."¹ *Habeas corpus* is, in fact, the appropriate instrument for enforcing the law of personal liberty, as declared in the Great Charter,—that no "freeman may be taken or imprisoned but by the lawful judgment of his peers or by the law of the land."

In Darnel's case (3 Car. I., 1627) the judges held that the command of the king was a sufficient answer to a writ of *habeas corpus*. The House of Commons thereupon passed resolutions to the contrary, and after a conference with the House of Lords the measure known as the Petition of Right was passed, which, *inter alia*, recited that, contrary to the Great Charter and other statutes, divers of the king's subjects had been imprisoned without any cause shown, and when they were brought up on *habeas corpus*, and no cause was shown other than the special command of the king signified by the privy council, were nevertheless remanded to prison, concluded "that no freeman in any such manner as is before mentioned be imprisoned or detained." In Jenkes's case, 1676, the lord chancellor (Lord Nottingham) refused to issue a *habeas corpus* in the vacation. Shortly afterwards was passed the famous Habeas Corpus Act (31 Car. II. c. 2), which is sometimes described as a consequence of the harsh if not illegal refusal of the writ in Jenkes's case, but which, as Hallam shows, was really due to the arbitrary proceedings of Lord Clarendon. The Act itself passed the Lords after many similar measures sent up by the Commons had been rejected.

The Habeas Corpus Act recites that great delays have been used by sheriffs and jailers in making returns of writs of *habeas corpus* directed to them; and for the prevention thereof, and the more speedy relief of all persons imprisoned for criminal or supposed criminal matters, it enacts in substance as follows. (1) When a writ of *habeas corpus* is directed to a sheriff or other person in charge of a prisoner, he must within 3, 10, or 20 days, according to the distance of the place of commitment, bring the body of his prisoner to the court, with the true cause of his detainer or imprisonment—unless the commitment was for treason or felony plainly expressed in the warrant of commitment. (2) If any person be committed for any crime—unless for treason or felony plainly expressed in the warrant—it shall be lawful for such person or persons (other than persons convicted or in execution by legal process) *in time of vacation*, to appeal to the lord chancellor as a judge, who shall issue a *habeas corpus* returnable immediately, and on the return thereof shall discharge the prisoner on giving security for his appearance before the proper court—unless the party so committed is detained upon a legal process or under a justice's warrant for a non-bailable offence. Persons neglecting for two terms to pray for a *habeas corpus* shall have none in vacation. (3) Persons set at large on *habeas corpus* shall not be recommitted for the same offence unless by the legal order and process of the court having cognizance of the case. (4) A person committed to prison for treason or felony shall, if he requires it, in the first week of the next term or the first day of the next session of oyer and terminer, be indicted in that term or session or else admitted to bail, unless it appears on affidavit that the witnesses for the crown are not ready; and if he is not indicted and tried in the second term or session after commitment, or if after trial he is acquitted, he shall be discharged from imprisonment. (5) No inhabitant of England (except persons contracting, or, after conviction for felony, electing to be transported) shall be sent prisoner to Scotland, Ireland, Jersey, &c., or any place

¹Constitutional History, vol. iii. c. 13.

beyond the seas. Stringent penalties are provided for offences against the Act. A judge delaying *habeas corpus* forfeits £500 to the party aggrieved. Illegal imprisonment beyond seas renders the offender liable in action by the injured party with treble costs and damages to the extent of not less than £500, besides subjecting him to the penalties of *premunire* and to other disabilities. "The great rank of those who were likely to offend against this part of the statute was," says Hallam, "the cause of this unusual severity."

The Habeas Corpus Act, it will be seen, applies only to the case of persons imprisoned on *criminal* charges. In 1758 the question arose whether, in the case of an imprisonment for military service, a *habeas corpus* could be applied for under the Act, and other questions of some difficulty were raised as to its effect in particular cases. The judges who were consulted by the House of Lords differed in their opinions, and ultimately the Act 56 Geo. III. c. 100 was passed, "for more effectually securing the liberty of the subject." It enacts (1) that a writ of *habeas corpus* shall be issued in vacation time in favour of a person restrained of his liberty (except persons imprisoned for debt or by civil process)—a privilege granted by the Act of Charles II. only in the case of commitments for criminal offences; (2) that though the return to the writ be good and sufficient in law, the judge shall examine into the truth of the facts set forth in such return, and if they appear doubtful the prisoner shall be bailed; (3) that the writ shall run to any harbour or road on the coast of England, although not within the body of any county. The last clause was intended to meet doubts on the applicability of *habeas corpus* in cases of illegal detention on board ship.

In Anderson's case, in 1861, the Court of Queen's Bench decided somewhat reluctantly that the writ runs to all the foreign dominions of the crown even when there are independent local judicatures. In consequence of this decision the Act 25 and 26 Vict. c. 20 was passed, enacting that "no writ of *habeas corpus* shall issue out of England, by authority of any judge or court of justice therein, into any colony or foreign dominion of the crown where her Majesty has a lawfully established court or courts of justice, having authority to grant and issue the said writ, and to ensure the due execution thereof throughout such colony or dominion."

In times of public danger it has been found necessary to suspend the Habeas Corpus Act by a special statute. This was done in 1817 by the Act empowering the king to secure and detain such persons as his Majesty shall suspect are conspiring against his person and government. More recently this extreme measure has been judged necessary in the case of Ireland (see 29 Vict. c. 1, continued for a short period by annual acts).

In the United States of America the law of *habeas corpus* has been inherited from England, and has been generally made to apply to commitments and detentions of all kinds. Difficult questions, unknown to English law, have arisen from the peculiar features of the American State-system. Thus the constitution provides that "the privilege of the writ of *habeas corpus* shall not be suspended unless when, in cases of rebellion or invasions, the public safety may require it;" and it has been the subject of much dispute whether the power of suspension under this provision is vested in the president or the congress. The weight of opinion seems to lean to the latter alternative. Again, conflicts have arisen between the courts of individual States and the courts of the Union. It seems that a State court has no right to issue a *habeas corpus* for the discharge of a person held under the authority of the Federal Government. On the other hand, the courts of the Union issue the writ only in those cases in which the power is expressly conferred on them by the constitution.

HABINGTON, WILLIAM (1605–1654), one of the most pleasing of English minor poets, was born at Hendlip in Worcestershire, on the 4th of November 1605. His father, Thomas Habington, was a prominent Catholic; to his mother, Lady Mary Habington, was attributed the revelation of the Gunpowder Plot. The poet was educated first at St Omer, and refusing to become a Jesuit was removed to Paris. On his return to England he met and fell in love with Lady Lucy Herbert, second daughter of Lord Powis, whom he celebrated under the poetical name of Castara. After some opposition he won her hand, and they were married about the year 1632. In 1634 he first published his famous volume of lyrical poems entitled *Castara*, which was reprinted in 1635 and 1640. In the latter year he also published a prose *History of King Edward IV.* and *The Queen of Arragon*, a tragi-comedy. This play was published at the request of his kinsman, the earl of Pembroke; it was afterwards revived by Samuel Butler. The last work printed by Habington was *Observations upon History*, 1641. In 1647 his father died; and during the Commonwealth, as we learn from Anthony Wood, the poet "did run with the times, and was not unknown to Oliver the usurper." He died November 30, 1654, and was buried in the family vault at Hendlip. Habington possesses all the faults of his age except its impurity; he is honourably known as the chastest of the Royalist lyrists. His genius was gently fantastic, mild in its play of fancy, delicately ingenious, and of an unruffled stately dignity. He never rises to sublimity or passion, but he is always gentleman-like and often extremely graceful. His best verses have a very modern tone, and remind the reader of the 18th rather than of the 17th century.

The works of Habington have not been collected. An excellent edition of *Castara* was published by Mr Arber in 1870, and *The Queen of Arragon* has been included in the Dodsley collection.

HACHETTE, JEAN NICOLAS PIERRE (1769–1834), an eminent French mathematician, was born at Mézières, where his father was a bookseller, on the 6th May 1769. For his early education he proceeded first to the college of Charleville, and afterwards to that of Rheims. In 1788 he returned to Mézières, where he was attached to the school of engineering as draughtsman to the professors of physics and chemistry. When twenty-three years of age he succeeded from among a number of candidates in gaining the professorship of hydrography at Collioure and Port-Vendre. While there he sent several able papers, in which some questions of navigation were treated geometrically, to Monge, at that time minister of marine, through whose influence he obtained an appointment in Paris. Thence he passed to a deputy-professorship at Mézières, and towards the close of 1794, when the Ecole Polytechnique was established, he was chosen one of its staff, being appointed along with Monge over the department of descriptive geometry. There he instructed some of the ablest Frenchmen of the day, among them Poisson, Arago, and Fresnel. Accompanying Guyton de Morveau in his expedition, earlier in the year, he was present at the battle of Fleurus, and entered Brussels with the French army. In 1816, on the accession of Louis XVIII., he was expelled from his chair by Government, at the same time that his friend and fellow-worker Monge was removed from the Institute. He retained, however, till his death the office of professor in the faculty of sciences in the Ecole Normale, to which he had been appointed in 1810—the same year in which he married the daughter of the physician Maugras. The necessary royal assent was in 1823 refused to the election of Hachette to the Academy of Sciences, and it was not till 1831, after the Revolution, that he obtained that well-merited honour. He died at Paris, January 16, 1834. Hachette was held in high esteem for his private worth, as

well as for his scientific attainments and great public services. His labours were chiefly in the field of descriptive geometry, with its application to the arts and mechanical engineering. It was left to him to develop the geometry of Monge, and to him also is due in great measure the rapid advancement which France made soon after the establishment of the *École Polytechnique* in the construction of machinery. His writings on descriptive geometry are still of value.

Hachette's principal works are his *Deux Suppléments à la Géométrie Descriptive de Monge*, 1811 and 1818; *Éléments de Géométrie à trois dimensions*, 1817; *Collection des Épreuves de Géométrie*, &c., 1795 and 1817; *Applications de Géométrie Descriptive*, 1817; *Traité de Géométrie Descriptive*, &c., 1822; *Traité Élémentaire des Machines*, 1811; *Correspondance sur l'École Polytechnique*, 1804-1815. He also contributed many valuable papers to the leading scientific journals of his time.

HACHETTE, LOUIS CHRISTOPHE FRANÇOIS (1800-1864), a French publisher, was born at Bethel in the Ardennes, May 5, 1800. After studying three years at a normal school with the view of becoming a teacher, he was in 1822 on political grounds expelled from the seminary. He then devoted several years to the study of jurisprudence; but in 1826 he resolved to establish in Paris a publishing business, the main object of which should be the issue of works adapted to improve the system of school instruction, or to promote the general culture of the community. The series of works which from that time were brought out by him included manuals in various departments of knowledge, dictionaries of modern and ancient languages, educational journals, and French, Latin, and Greek classics annotated with great care by the most eminent authorities. Subsequent to 1850 he, in conjunction with other partners, published a cheap railway library, scientific and miscellaneous libraries, an illustrated library for the young, libraries of ancient literature, of modern foreign literature, and of modern foreign romance, a series of guide-books, and a series of dictionaries of universal reference. In 1855 he also founded *Le Journal pour tous*, a publication with a circulation of 150,000 weekly. There can be no question that by his efforts to circulate such a variety of wholesome and instructive literature, Hachette is entitled to rank among the greatest benefactors of his country. He also manifested great interest in the formation of mutual friendly societies among the working classes, in the establishment of benevolent institutions, and in other questions relating to the amelioration of the poor, on which subjects he wrote various pamphlets; and he lent the weight of his influence towards a just settlement of the question of international literary copyright. He died 31st July 1864.

HACKBERRY, a name given to the fruit of the *Celtis occidentalis*, L., belonging to the natural order *Ulmaceae*. It is also known under the name of "sugar berry," "beaver-wood," and "nettle tree." The hackberry tree is of middle size, attaining from 60 to 80 feet in height, and with the aspect of an elm. The leaves are ovate, cordate-ovate, and ovate-lanceolate, with a very long taper point,—mostly glabrous above, and usually soft-pubescent beneath. The soft filmy flowers appear early in the spring before the expansion of the leaves. The fruit or berry, about the size of a bird-cherry, is of an obovate shape, of a reddish or yellowish colour when young, turning to a dark purple in autumn. This tree, together with other species of the same genus, is distributed through the deep shady forests bordering the river banks of New England to Wisconsin and even further southward. The fruit has a sweetish and slightly astringent taste, and is largely eaten in the United States, and, although not official, has been highly recommended in cases of dysentery. The seeds contain an oil like that of almonds. The bark is tough and fibrous like

hemp, the wood is hard and compact and heavy, and next to ebony and box has been spoken of as the best for durability, strength, and beauty; its tenacity and flexibility have led to its employment as shafts for carriages, hoops, &c. The root has been used as a dye for linens. The root, bark, and leaves of *C. orientalis* are employed in the East as a remedy in epilepsy.

HACO, or HAKON (c. 920-960), surnamed the Good, king of Norway, was the son of Harold Fairhair by a female slave, and was presented by Harold to King Athelstan of England, to mark his contempt for an insult he had received. The child was placed by a Norse warrior on Athelstan's knee, who was thus made to observe the symbol of adopting a child that was base born. Athelstan did not, however, take vengeance on the innocent cause of his anger, but brought him up as one of his own sons. On hearing of the death of Harold, he supplied Haco with men and ships, and sent him to Norway to wrest the throne from Eric, eldest son of Harold, whose violent and cruel reign had during the life of his father gained him the general hatred of his subjects. The news of Haco's arrival in Norway spread, says the saga, "like fire through dried grass." Eric at once took flight to Orkney and then to England, and Haco was chosen king at every "thing." Haco, though himself a Christian, found it impossible in his time to establish Christianity in Norway. He ruled his kingdom with great justice and prudence, and gained for it many victories over the Danes by land and sea. He was slain in a great fight against the Danes, led by the sons of Eric, about the year 960.

HACO V., surnamed the Old, king of Norway, son of Haco IV., was on the death of his father in 1204 excluded from the throne on the ground of supposed illegitimacy, and only became king in 1223, after his mother, to establish his rights, had undergone the ordeal of fire. He greatly increased the prosperity of Norway, and he also added to his kingdom Iceland and Greenland. As he had a dispute with Alexander III. of Scotland in regard to the sovereignty of the Hebrides, he set sail about 1263 on a great expedition against the west of Scotland, where he took possession of Arran and Bute, but suffered such a severe defeat at Largs that he was compelled again to put to sea. After losing many ships by storm, he sailed to Orkney, where he died in the following winter. It is supposed by some that his fleet in his voyage north passed between Skye and the mainland, and that it is from this fact that the narrow sound of Kyle-Akin received its name.

For the kings named Haco see the *Heimskringla* of Snorro Sturluson, which, however, does not include the reign of Haco V., translated into English by Samuel Laing, London, 1844. The saga of Swerre and his successors was published by Unger under the title *Konunga Sögur*, Christiania, 1870-73. The *Saga Hákonar Hákonarsonar* forms the 10th vol. of the *Fornmanna Sögur* published at Copenhagen in 12 vols., 1825-39, and translated into Danish and Latin in 12 vols., 1828-46. See also *Sturlunga Saga*, 2 vols., Oxford, 1878, and Carlyle's *Early Kings of Norway*, London, 1875.

HADAD, the name of a Syrian deity, is met with in Scripture as the name of several human persons; it also occurs in the compounds Benhadad, Hadadrimmon, and Hadadezer. The etymology of the word, of which Hadar, Ader, and Arad appear to be incorrect variations, is obscure; the divinity primarily denoted by it, however, according to Philo of Byblos (Müller, *Fr. Hist. Gr.*, iii. 569; cf. Macrob., *Satur.*, i. 23), is the king of the gods, the greatest and highest, the sun; and these interpretations seem to point to some such radical meaning as *unicus*. The Syrian kings of Damascus seem to have habitually assumed the title of Benhadad, or son of Hadad (three of this name are mentioned in Scripture), just as a series of Egyptian monarchs are known to have been accustomed to call themselves sons of Ammon-Ra. The word Hadadrimmon,

for which the inferior reading Hadarrimmon is found in some MSS., in the phrase "the mourning of (or at) Hadadrimmon" (Zech. xii. 11), has been a subject of much discussion. According to Jerome and all the older Christian interpreters, the mourning for what occurred at a place called Hadadrimmon (Maximianopolis) in the valley of Megiddo is meant, the event alluded to being generally held to be the death of Josiah; but since Hitzig and Movers the opinion has been gaining ground that Hadadrimmon is merely another name for Adonis or Thammuz, the autumn aun-god, the allusion being to the mournings by which the Adonis festivals were usually accompanied (Hitzig on Zech. xii. 11, Isa. xvii. 8; Movers, *Phönizier*, i. 196).

Full materials for the whole discussion will be found in Baudissin's *Studien zur Sem. Religionsgesch.* (1876), Abh. v. This author, however, has considerably modified his views in Herzog and Plitt's *R. E., s. v.*, having in his earlier essay been misled in important points by statements of Schrader (*Keilinsch. und A. T.*, pp. 101 seq.), which have since been found to require correction (see Gutschmidt, *Neue Beiträge*, p. 47 seq.; Welhausen's criticism of Baudissin in *Gött. Gel. Anz.* (1877), Stück 6; Schrader, *Keilin. und Geschichtsforsch.* (1878), pp. 371 seq., 538 seq.).

HADDINGTON, or EAST LOTHIAN, a maritime county of Scotland, lies between 55° 46' 10" and 56° 4' N. lat. and between 2° 8' and 2° 49' W. long. It is bounded on the N. by the Firth of Forth, on the E. by the North Sea, on the S. by Berwickshire, on the W. by Edinburghshire. Its seaboard is 31½ miles. Its greatest length from east to west is 25 miles, its breadth from north to south about 16 miles. Its area covers 179,142 acres (280 square miles), of which 189½ are under water, 5505 foreshore, and 142½ in "links." The general outline of the county is that of an irregular quadrilateral figure with its northern angle projecting into the sea. Along a south-and-north line through the county town, the land slopes gradually up from the coast to the Garleton Hills, thence down to the Tyne valley, and then up again to the Lammermuir Hills, which occupy the southern district of the county. On the east and west the ground slopes from the Lammermuirs to the sea, but near the sea the fall is so gentle that the land has the appearance of a plain. Two almost isolated hills break the level,—North Berwick Law (940 feet) on the coast, and Traprain Law (700) in the eastern part of the Tyne valley. The chief summits of the Lammermuir Hills are Spartleton (1534), Lammerlaw (1500), and Soutra Hill (1230). The only stream of any importance is the Tyne, which, after a course of 7 miles in Midlothian, flows through the county with a gentle current north-east past the town of Haddington, and falls into the sea at Tyne-mouth. A very fine variety of trout is found in it; and below the rocks of the linn at East Linton salmon are occasionally caught. The Whiteadder rises in the county, and flows south-east into Berwick.

Geology and Mineralogy.—The Lammermuirs are composed chiefly of Lower Silurian strata, overlaid in part by Old Red Sandstone and conglomerate—one great mass of the latter extending south-east from Spott, with a breadth of 3 or 4 miles, across the hills into Berwickshire. Another belt of Old Red Sandstone rather more than 1 mile in breadth begins at the sea a little to the south of Dunbar, and stretches along the base of the Lammermuirs. Patches of Old Red Conglomerate occur also here and there in the Lammermuirs further to the west, and are seen in the upper tributaries of Gifford and Humble waters. The ground to the north of the Lammermuirs is occupied chiefly by rocks belonging to the Calcareous Sandstone and Carboniferous Limestone series of the Carboniferous formation. The Calcareous Sandstones cover a wide area west and east of Haddington, extending south to the Lammermuirs, along the base of which they trend south-west beyond the county boundary. They also appear in the lower reaches of the

Tyne valley, covering a considerable area between Tynninghame Links and Biel Water. Again they are seen on the shore between Torness Point and Dunglass Burn, whence they strike inland. The hilly tract between Haddington and North Berwick is made up of various volcanic rocks of Lower Carboniferous age, such as porphyrite, dolerite, and tuff. In the western part of the county the Carboniferous Limestone series occupies an extensive area and is rich in limestones and coal-seams. This area forms the eastern margin of the Midlothian coal-field. A patch of the Limestone series also appears upon the coast about a mile south of Dunbar. Besides these bedded aqueous and volcanic rocks, there are numerous intruded masses, dykes, and veins of felstone and basalt, and some pipes of tuff and agglomerate which mark the sites of ancient volcanoes of Lower Carboniferous age. Granite is found at Priestlaw. Deposits of glacial origin are met with more or less abundantly, especially in the low-lying tracts. These consist of till or boulder-clay and mounds and sheets of sand and gravel, underneath which the older rocks are often concealed over wide areas. Alluvial deposits occur along the course of many streams, but the only considerable alluvial flats are those of the Tyne.¹

Coal of a very fair quality is extensively worked in the west. So long ago as 1200 the monks of Newbattle obtained this mineral from Prestongrange. Limestone is found throughout the greater part of the shire. A vein of hematite of a peculiarly fine character was discovered in 1866 at the Garleton Hills, and wrought for some years; but from a variety of causes the works have been meanwhile suspended.

Climate.—The climate is on the whole mild and equable. East winds, however, prevail in the months of March, April, and May, and from the lie of the county it is exposed to their full sweep. The amount of rainfall is far below the average of Great Britain. During the period 1835-64 the average annual rainfall was 24·85 inches,—the greatest fall being 32·7 in 1836, the least 17·3 in 1842. The average monthly fall is lowest in April (1·16) and highest in August (2·57). In 1872 the rainfall reached the exceptional amount of 41·51 inches.

Agriculture, &c.—The soils are various. The Lammermuirs are of course unproductive, but the slopes to a considerable height are cultivated; and for a considerable way down the land is very good. In the centre of the county there is "a tenacious yellow clay resting upon a tilly subsoil," and this land is not well suited for agricultural purposes. Along the margin of the Firth the soil is naturally of a sandy nature, but farther inland it is composed of rich loam and is very fertile. The most productive region is the land about Dunbar. The potatoes there are very good, and under the name of "Dunbar reds" are highly esteemed in the London market, selling at times for as much as £45 an acre. From the beginning of the present century till within the past few years East Lothian agriculture has on the whole been held to be the best in Scotland. This is not so much due to the natural fertility of the soil as to the enlightened enterprise of its cultivators. Andrew Meikle here first introduced the threshing mill (1787). Tile draining was first extensively used here, and the reaping machine (now universally employed) and the steam plough were introduced at a comparatively early period of their history. The high price of grain at the time of the Crimean War gave a great impetus to farming, and in consequence rents rose as much as from 15s. to £1 per acre; this, with the increased cost of labour, which has risen 35 or 40 per cent. (about 10s. per acre) within the last seven or eight years, has sadly diminished the profits of the farmer. The size of the farms is above the average of Great Britain. The majority are from 200 to 500 acres—a very few from 600 to 1200 acres. They are usually let on leases of nineteen years' duration. The rotation of crops is generally the six-course shift, viz., (1) grass (pasture or hay), (2) oats, (3) potatoes, turnips, or beans, (4) wheat, (5) turnips, (6) barley.

According to the agricultural returns of 1879, of the total area of 179,142 acres 115,364 acres were under cultivation, distributed as follows:—corn crops, 44,719 (wheat, 7910; barley, 19,536; oats, 15,746); green crops, 25,656 (potatoes, 9335; turnips and swedes, 14,736); clover and grass, 27,194; permanent pasture, 16,000; bare fallow, 1075. Of live stock the numbers were—

¹ See the *Geology of East Lothian*, by Howell, Geikie, and Young, with Appendix on Fossils, by G. W. Salter. Other works are enumerated on p. 69 of this treatise.

horses, 3818, or 3·3 for every 100 imperial acres as against a general average for Scotland of 4·2; cattle, 8205, or 7·1 as against 23·0; sheep, 108,672, or 94·2 as against 145·1; pigs, 2485, or 2·2 as against 2·7.¹ Those comparatively small averages are of course explained by the fact that the county is not a pastoral one. It deserves to be noted, however, that its flocks of Leicester sheep have for years been justly celebrated, and shorthorns of a very high class have been successfully bred.

Gauze is no great hindrance to agriculture. A source of greater annoyance is the immense number of wood pigeons which, in defiance of all efforts to hold them in check, commit great havoc yearly.

The wages of farm servants average about 18s. weekly, the "grieve" or farm overseer receiving a little more; but of this only from £20 to £25 per annum is given in money. The rest is paid in kind, and consists of meal, potatoes, a cow's keep, a cottage, and piece of ground. These cottages have been greatly improved of late years, and are now very fair dwellings indeed. The "bothy system" is practically a thing of the past. Extra field labour is supplied by gangs of Irish or Highland workers, who dwell in the towns, but go out during the day to work in the country. The regular employés are hired for the most part at "feeing-markets," though advertisement and private arrangement are also often employed.

According to the return for 1873-74, there were 1509 proprietors in the county owning a total 171,739 of acres, of the annual value of £349,209.² The average rental was £2, 0s. 8d. per acre,—that of all Scotland being £1. There were 1191 proprietors (79 per cent. of the whole) who owned less than 1 acre; from 1 to 188 owned 10 acres, and 47 from 10 to 100; and 9 owned between 5000 and 21,000, the largest proprietors being—Marquis of Tweeddale, Yester House, 20,486 acres; Lady Mary Hamilton, Biel, 14,345; Balfour of Whittinghame, 10,564; Earl of Wemyss, Gosford, 10,136; Sir G. Grant Suttie, Balgone, 8788; Earl of Haddington, Tynninghame, 8302; Earl of Hopetoun, 7967; Houston of Thurston, 6492; and Houston of Clerkington, 5148.³

Communication.—The county is well supplied with roads. The chief line of railway, however, runs along the coast, and this, notwithstanding the aid of branch lines, places a considerable district at a serious disadvantage.

Population, &c.—The population of the county, which is divided into 25 parishes, was 37,676 in 1871, showing an increase of 78 over the number for 1861. It thus appears that the growth of the county town, of North Berwick, a thriving watering-place, and of the mining parishes does little more than counterbalance the decrease in purely agricultural parishes, which in some cases amounts to as much as from 7 to 18 per cent. The chief towns and villages are—Haddington, the county town, 4004; Dunbar, 3422; North Berwick, 1418; Tranent, 2306; East Linton, Prestonpans, Aberlady, Gullane, and Dirleton. The county returns one member to parliament, and the burghs of Haddington, Dunbar, and North Berwick unite with Lauder (Berwickshire) and Jedburgh (Roxburghshire) in returning another.

Educational Endowments.—The provision for education outside of the public school system is inconsiderable. Schaw's and Stiell's Hospitals in the parishes of Prestonpans and Tranent are charitable educational institutions. In Salton parish there is a fund for educational purposes, left by Gilbert Burnet, bishop of Salisbury. According to the Endowed Schools' Report of 1875, the annual incomes of these were £864, £812, and £97 respectively. School and college bursaries are given annually by the East Lothian Association.

History and Antiquities.—The early Celtic inhabitants of the district have left as memorials of their possession a few local names, and some traces of circular camps (Garvald and Whittingham parishes) and hill forts (Bolton parish). The Romans built here no enduring edifices, and there are no certain remains of their camps, but they brought the ground to a high degree of cultivation. The county afterwards formed part of the Saxon kingdom of Northumberland, but it was joined to Scotland by Malcolm II. in 1020. It was fairly prosperous till the wars of Bruce and Balliol; but from that time till the union of the kingdoms it suffered from its proximity to the English border, and from civil wars. In more modern times it was the scene of two great battles—that of Dunbar (1650) gained by Cromwell over Leslie and the Covenanters, and that of Prestonpans (1745) in which Prince Charles defeated Sir John Cope. The prosperity of the county, like that of many other parts of Scotland, is the growth of the present century.

The chief ruins are—Hailes Castle, where Queen Mary of Scots resided for a brief period after her abduction by Bothwell; Dunbar Castle, defended in 1337 by Black Agnes against the earl of Salisbury; Dirleton Castle, a venerable ruin of the 12th century,—

taken in 1298 by Edward I. and again in 1650 by Cromwell's forces; Innerwick Castle, near Dunbar; the collegiate church of Seton in the parish of Tranent, built before 1390; North Berwick Abbey, founded about the middle of the 12th century; and Tantallon Castle, opposite the Bass Rock, formerly the chief seat in the east of the Douglas family. The genius of Scott has given to Tantallon a name in English literature greater even than its name in Scottish history; and readers of *Marmion* will also remember the name of Hobgoblin Hall, romantically situated near the village of Gifford (about six miles south of the county town), a place connected by name and legend with all manner of popular superstitions. Of modern mansions the chief are Broxmouth Park (Duke of Roxburgh), Yester House (Marquis of Tweeddale), Tynninghame House (Earl of Haddington), Gosford and Amisfield House (Earl of Wemyss)—Gosford containing a fine collection of pictures, Lennoxlove House (Lord Blantyre), Biel and Archerfield (Lady M. Hamilton), Winton House (Lady Ruthven), and Salton Hall (Fletcher). A lofty column on one of the Garleth hills, erected to the memory of the fourth earl of Hopetoun, is seen from nearly every part of the county.

Of the eminent men born in or connected with the county the following may be mentioned:—Sir David Lindsay of the Mount was born 1490 at Garleth Castle, an old keep now utterly ruinous; William Dunbar was born at Biel about 1460; Blair, author of the *Grave*, and Home, author of *Douglas*, were successively ministers of Athelstanford; David Calderwood, the historian of the Kirk of Scotland, was minister at Pencaitland, and Principal William Robertson at Gladsmuir; George Heriot, the famous goldsmith of James VI., is said to have been born in Gladsmuir. The historic families of Fletcher of Salton, Dalrymple of Hailes, Maitland of Lethington, and Hamilton of Preston belong to the county.

HADDINGTON, a royal and parliamentary burgh, and the chief town of the above county, is situated on the banks of the Tyne, about 17 miles east of Edinburgh. It occupies almost the centre of the shire to which it has given the name. It consists of two main streets, which are wide and well built,—High Street to the south and Market Street to the north; both run towards the Tyne, here crossed by three bridges, two of which connect the town with its suburb of Nungate. This suburb consists of old and ruinous houses, and is inhabited for the most part by Irish agricultural labourers. The systems of drainage and water supply are excellent, but the want of manufactures and the inconvenience of its railway branch line have prevented the growth of the burgh.

The chief edifices are the county buildings, the corn exchange, which next to that of Edinburgh is the largest in Scotland, the town-house adorned with a very elegant spire 150 feet high, and the district asylum for the insane. There is a monument of some pretensions to Robert Ferguson of Raith, and a somewhat trifling one to the memory of Home the author of *Douglas*. The chief structure, however, is the church, an edifice probably dating from the 13th century. It is 210 feet long, and is surmounted by a square tower 90 feet high. One part is used as the parish church; the remainder, though ruinous, is now preserved with a care that makes some amends for centuries of neglect. To this church the name of *Lucerna Laudonia* has long been applied, but it seems probable that the edifice to which Fordun and Major applied that name was the church of the Franciscan Friars close to the Tyne, of which not a fragment now remains. The Nungate possesses the ruin of an old chapel of St Martin. The grammar school of Haddington was established at a very early period, and carefully fostered by the burghal authorities. At one time it attained considerable eminence, but latterly fell into complete disuse. Under the name of the Knox Memorial Institute, a very handsome school building has been erected (1879), and with this the ancient burgh schools incorporated. The population of the burgh in 1861 was 2874 and in 1871 4004.

Haddington is said to have been erected into a burgh by David I. It must have been a place of considerable importance, for when the "Curia Quatuor Burgorum" subsisted there was an appeal from the sentences of burgh courts to that of the chamberlain at Haddington. There are also extant charters in its favour from Robert the Bruce and Robert II. Exposed as it was to the English attack it was frequently ravaged and burned. In 1548 it was forti-

¹ The statistics of the five preceding years do not show any very great variation from these figures.

² In 1878-79 the lands valuation of the county amounted to £363,173, 10s.

³ For further particulars as to the agriculture, see Scott Skirving's prize essay printed in vol. v. (4th series, 1873) of the *Highland and Agricultural Society's Transactions*.

fed by Lord Grey of Wilton, the English commander, but was besieged in the following year by the Scotch and their French auxiliaries, who forced the garrison to abandon the town. As one result of all this struggle and suffering, it is impossible to dig far in any direction without coming on human remains. Haddington has also suffered frequently from floods. An inscription in the centre of the town commemorates one of the most notable of these (October 4, 1775), marking the point to which the water rose. John Knox was born (1505) at the Giffordgate in the Nungate; John Brown, a celebrated dissenting divine, several of whose descendants have been eminent in science and literature, had a charge in Haddington for many years; and Edward Irving was for some years mathematical master in the burgh school.

For the general history of the county see Chalmers's *Caledonia*, vol. ii.; also Dr Barclay's paper on "Haddington," in the 1st vol. of the *Transactions of the Society of Antiquaries of Scotland*, vol. i. (1792); Hepburn's *View of the Agriculture of East Lothian* (1794); Somerville's *Survey of East Lothian* (1805); *New Statistical Account of Scotland*, vol. ii. (1845); *History of Haddington*, by James Miller (1844). The siege of the town is fully narrated in *Histoire de la Guerre d'Escosse*, by Jean de Beaugué. For an account of the burgh records, see Thomas Thomson's paper in the *Proceedings of the Society of Antiquaries of Scotland*, vol. ii. pt. ii. The question as to the birthplaces of Knox, Lyndsay, and Dunbar is fully discussed in David Laing's editions of those writers. (F W.)

HADDOCK (*Gadus aeglefinus*, the *Schell-fisch* of the Germans, *Hadot* of the French), a kind of cod-fish, distinguished by a black lateral line and a blackish spot above the pectoral fin. It is common round the British and Irish coasts, and generally distributed along the shores of the North Sea, extending across the Atlantic to the coast of North America. The haddock is prone, however, to abandon for a longer or shorter period a locality frequented by it. It attains to a weight of 15 lb, and is one of the most valuable food fishes of Europe.

HADERSLEBEN (Danish, *Haderslev*), a town of Prussia, capital of a circle in the province of Schleswig-Holstein, is situated 48 miles north of the town of that name, in a pleasant valley on the Hadersleben fiord, which is about 9 miles in length and communicates with the Little Belt. The principal buildings are the beautiful church of St Mary dating from the 13th century, the theological seminary established in 1870, the gymnasium, and the hospital. The industries include iron-founding, tanning, and the manufacture of machines, tobacco, and gloves. The harbour, owing to the accumulation of mud, is only accessible to small vessels. The population in 1875, including the garrison, was 8356.

Hadersleben is first mentioned in 1228, and received town rights from Duke Waldemar II. in 1292. It suffered considerably during the wars between Schleswig and Holstein in the 15th century. In November 1864 it was ceded along with Schleswig to Prussia. Two Danish kings, Frederick II. and Frederick III., were born at Hadersleben.

HADRAMAUT. See ARABIA.

HADRIAN, Roman emperor (117–138 A.D.), distinguished for the peace and beneficent energy of his government, was born at Rome 76 A.D. His full name was Publius Ælius Hadrianus; his ancestors, originally from Picenum, had been settled at Italica in Spain since the time of the Scipios. He lost his father at the age of ten, and was placed under the guardianship of Trajan, a cousin of his father and also a native of Italica, who was already a conspicuous man in the Roman army. We know little of Hadrian's youth; but he gave early promise of the readiness and versatility which distinguished him in later life, for he was so ardent a student of Greek that men nicknamed him *Græculus*. At fifteen he entered on the practical career of war and government which befitted a Roman, and grew fond of the chase even to excess. Patronized by Trajan and assisted by powerful friends he rose rapidly, filling successively all the civil and military offices, which now, as under the republic, were open to young men of good birth. On Trajan's elevation to the empire Hadrian was the first to congratulate him. He served with distinction in both the Dacian campaigns; in the latter Trajan presented him with the ring he had received from Nerva, a proof of his

regard which justified him in aspiring to be his successor. If Trajan was not always favourably disposed towards Hadrian, the good-will of the empress Plotina never failed him, and was particularly helpful in some of the most critical turning points of his career. She it was who secured his alliance with Sabina, granddaughter of the emperor's sister, a marriage, however, which proved anything but happy. She, it was thought, did him still more effectual service at Trajan's death, even determining the question of the succession in his favour. When that emperor returned from his victorious war in Parthia, the succession was still undecided; and we are assured on the express testimony of Dion Cassius that Plotina and her friends concealed his death for several days in order to facilitate the elevation of Hadrian. Whatever may have been the truth of such stories, Hadrian's claim to the empire rested on the unquestionable fact that he was the fittest man. His position as prefect of Syria, and commander of the legions with which Trajan had prostrated the Parthian empire, made him supreme in the army, while his peaceful disposition and civil demeanour must have made him acceptable to the senate. Yet he was not unconscious of the insecurity of his position; for he hastened to propitiate the army by a donation of twice the usual amount, and to excuse his abrupt elevation to the senate by alleging the impatient zeal of the soldiers and the welfare of the state, which could not exist without an "imperator." The first important act of Hadrian was to abandon the late conquests of Trajan, and again to make the Euphrates the eastern boundary of the empire. At his elevation the provinces were unsettled, and the barbarians on the frontier restless and menacing. He was convinced that the old limits of Augustus offered the most defensible frontier, and that the energy of the emperor was sufficiently occupied in governing the provinces already won. This policy of renunciation was ascribed to jealousy of Trajan; but history has recognized its wisdom. While arranging the affairs of the East, Hadrian had an opportunity of pardoning some eminent citizens who were accused of hostility to him, and after his return to Rome he confirmed his popularity by many gracious acts. Modestly declining the honours heaped upon himself, he carefully rendered the last offices to the deceased emperor, and considerably lightened the burdens of the citizens. During an absence in Mesia, where he had gone to compose some troubles with the Sarmatæ and Roxolani, a formidable conspiracy was formed against him. The details are obscure; but four consular men, among the most eminent of Rome, were accused of being concerned in it, and were put to death. Some, however, went so far as to say that the conspiracy was a scheme devised by Hadrian for getting rid of dreaded rivals. It was a dark transaction which threw a suspicion on his character. On his return to Rome he exerted himself to undo the evil effects of it by a generous and popular policy. Towards the senate he expressed the utmost deference and consideration; he admitted the most eminent of its members to familiar intercourse, raised them to the highest honours, and supplied the indigent with means to maintain their position. He was equally liberal to the body of the people, granting them a large donation of money, remitting the arrears of taxes for the last fifteen years, and increasing the funds which Trajan had devoted to the alimentation of poor children. These measures of Hadrian might be criticized as the calculating policy of one who felt his position to be insecure, and who could afford to be generous to the city out of the revenues of the empire. But such a theory could not apply to what is most characteristic in his rule,—his unwearying care for the provinces and for the empire as a whole. He understood the true task of a Roman emperor better perhaps than any of his predecessors. More clearly than any of

them he saw that the period of conquest was past, that an extension of the frontiers would only weaken the defensive power of the empire, that the time for consolidation and for softening the distinction between Rome and the provinces was come. While Trajan had been guilty of the anachronism of rivalling Alexander the Great, Hadrian made it the work of his life to become acquainted with the provinces, to learn their needs and resources, to improve and benefit them; he sought to be the effective ruler of the empire as a whole, and so was the first to realize the cosmopolitan task which his position imposed. For this end he sought to obtain a personal knowledge of the people he had undertaken to govern. Leaving Rome in 119, he visited probably every province of the empire. After traversing Gaul he inspected the legions on the Rhine, and then crossed to Britain, where he built (121) the great rampart from the Tyne to the Solway which bears his name. He returned through Gaul into Spain, and then proceeded to Mauritania, where he suppressed an insurrection. We next find him in the East averting a war with Parthia by a timely interview with the king. From the Parthian frontier he travelled through Asia Minor and the islands to Athens, where he sojourned a considerable time, and so returned by Sicily to Rome, having made the circuit of the empire. After some stay at Rome he resumed his travels. It is impossible to fix the details of this second progress with any exactness. It was chiefly in the East; and he did not finally return to Rome till 134. Everywhere he left lasting traces of his restless and beneficent energy; he built aqueducts and temples, and raised fortifications in suitable places; he inspected the details of the administration, learned to know the officials, and made himself at home in the military encampments. He was accompanied by a body of architects and artizans organized like a legion, whom he employed to gratify his passion for building in a truly imperial manner. Athens was the favoured scene of his architectural labours; he added a new quarter to the city, and finished the temple of the Olympian Zeus. While Hadrian spent his life in inspecting the provinces, and was not disinclined to purchase peace by a subsidy to the restless tribes on the frontiers, he did not neglect the army. All along the frontier his legions stood in constant preparation for battle. He maintained a rigorous discipline; the rules he drew up for the army long served as a kind of military code. He trained them to the severest exercises, and anticipated all complaint by sharing in their fatigues, walking bare-headed on a march of 20 miles a day, and partaking of their coarse fare of cheese, lard, and sour wine. The only important war in which this army was tested was the great rebellion of the Jews, which broke out in 131, and lasted for several years. The founding of a Roman colony on the site of Jerusalem, and an order of Hadrian forbidding the rite of circumcision, were the causes of the war. The Jews fought with the most resolute despair, and they were crushed only by a powerful army commanded by the best general of the empire. According to Dion, 580,000 Jews fell in battle. The whole country was reduced to a wilderness. But the loss of the Roman legions was so severe that in writing to the senate Hadrian omitted the customary formula:—"If you and your children are well, it is well; I and the army are well." In the later years of his life Hadrian discontinued his travels, and lived at Rome or near it. His health, which had been impaired by long exposure to the extremes of heat and cold, began to fail; and, what was worse, the dark and suspicious moods which had broken out occasionally in his earlier years became more frequent and fatal. His aged brother-in-law Servianus fell a victim to his jealousy; his wife Sabina died, not without a rumour of poisoning. Most of those who had been his familiar

friends, and had been raised by him to the highest offices, were superseded, or banished, or put to death. But his passion for architecture did not abate. He built for his residence the great villa of Tibur, which was eight miles in circuit, and was a kind of epitome of the world, with miniatures of the most celebrated places in the provinces, and even of Hades. He built a splendid mausoleum, which has been the nucleus of the castle of St Angelo, and rebuilt several edifices at Rome. In these years he had to choose a successor. His first choice was Ælius Verus, who did nothing to justify such a distinction. The next was Antoninus Pius, so called from the filial assiduity with which he cherished the last days and the memory of his adopted father. Antoninus saved him from suicide, to which his physical sufferings impelled him, and from imbruing his hands in the blood of many noble Romans, who had provoked his moody and fickle temper. Hadrian died at Baiæ, 138 A.D. The cruelty of his latter life had so eclipsed the lustre of his early rule that the senate at first refused him divine honours, and were prevailed upon to grant them only at the urgent solicitation of Antoninus. In the travels and administrative energy of Hadrian we see only one side of his character. He had a versatile and many-sided mind, in which the faculty for command, speculative curiosity, and literary ambition were strangely blended. Not satisfied with the toils imposed on the laborious autocrat of the world, he sought to excel the Greek professors and artists each in his own special walk. In painting, sculpture, and music, in rhetoric and philosophy, he considered himself the competent rival and critic of men who had made these pursuits the work of a lifetime. The architect Apollodorus atoned for his frankness with his life. The more politic Favorinus, when reproached for yielding too readily to the emperor in some grammatical discussion, replied that it was unwise to dispute with the master of thirty legions. The product of Hadrian's pen which has been most celebrated is the dying address to his soul:—

"Animula vagula, blandula,
Hospes comesque corporis,
Quæ nunc abibis in loca
Pallidula, rigida, nudula;
Nec, ut soles, dabis jocos?"

Under Hadrian Salvius Julianus composed a "perpetual edict," which is supposed to have been a fixed code of some kind, but the exact significance of the edict is disputed. Still there can be no doubt that Roman law owes much to Hadrian.

The sources for Hadrian's life are unsatisfactory; the chief are Spartianus in the *Scriptores Historie Auguste*, and Dion Cassius as abridged by Xiphilinus, lib. lxxix; see also Aurélius Victor *De Cesaribus*, and Eutropius; for modern works consult Merivale's *History of the Romans under the Empire*; Gregorovius, *Gesch. Hadrians*; and W. W. Capes's "Age of the Antonines" in the series *Epochs of Ancient History*. (T. K.)

HADRIAN, WALL OF. It is under this heading that it seems most convenient to give a short account of the stone wall and other works erected by the Romans in the north of England between the Solway and the Tyne, and commonly known as the Roman Wall. As will be afterwards seen, those who have written on the subject are by no means agreed that the name of Hadrian ought to be exclusively associated with this great fortification. But before touching on the question, it is necessary to describe the works themselves.

Viewed as a whole the Roman Wall, when entire, consisted of three parts:—(1) a stone wall, strengthened by a ditch or fosse, at a short distance from its northern base; (2) three parallel earthen walls, with a ditch sloping down from the northern side of the second of these lines; (3) stations, castles, and turrets, placed at various intervals for the accommodation of troops, and communicating with one another by a military way.

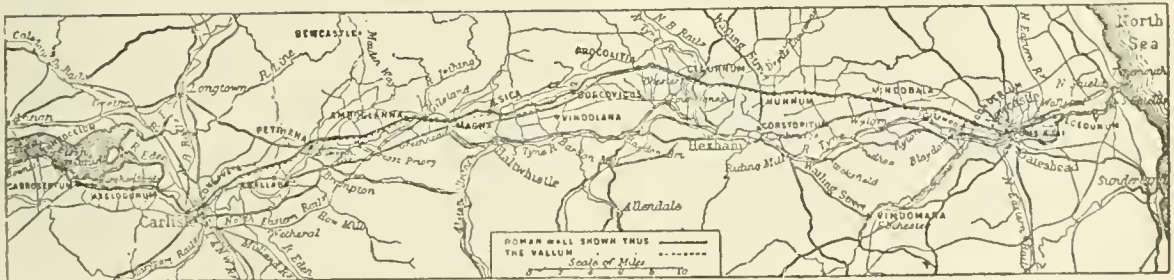

The Murus or stone wall extended from Wallsend on the Tyne to Bowness on the Solway Firth, a distance of fully 73 English miles. No portion of it now remains as when finished, so that its original height cannot be accurately determined. Bede gives 12 feet, an estimate that our chief modern authority on the Wall, Dr J. Collingwood Bruce, deems too low, for some parts of its course at least. Its thickness varies, being 6 feet in some places and 9½ in others.

The northern face of the Wall was continuous, but the southern had numerous outsets and insets, as if portions of the work had been carried on at the same time but without definite instructions as to a uniform breadth. In this way when sections met differences in width often showed themselves, though the junction was so managed that the irregularity was confined to one face. It is not improbable that a similar discretion was allowed as regards height. Both sides consisted of blocks of freestone 8 or 9 inches thick, 10 or 11 broad, and from 15 to 20 long. These had been sometimes quarried near the spot, sometimes brought from considerable distances. The interior was filled with rubble firmly cemented with mortar of a peculiar tenacity. In pursuing its course from sea to sea, the Wall seldom deviated from the shortest and straightest course it could follow, and then only with the evident design of seizing neighbouring elevations that would otherwise have commanded its position. Along the whole length of its northern base, and adding greatly to its strength as a defensive work, was drawn a ditch or fosse of varying breadth and depth,

36 and 15 feet respectively being probably its average dimensions. In some places the difficulties to be overcome by its excavators, owing to the rocky nature of the soil, must have been enormous in an age when blasting with gunpowder was unknown. But none of them have been shunned.

South of the Murus ran the earth wall or Vallum, consisting, as has been already stated, of three ramparts and a ditch. Of these mounds the most northerly was raised at a distance from the base of the stone wall varying, according to the nature of the country, from 30 yards to half a mile. Time and the spoiler have dealt so hardly with it that its original dimensions cannot now be accurately stated. It seems, however, to have been about 20 feet broad at the base and at least 10 feet high. The materials of which it was made up consisted of earth largely intermixed with fragments of stone of all sizes and shapes. 24 feet or so further south was a ditch apparently somewhat inferior in breadth and depth to the ditch of the Murus, though otherwise of the same character. On its southern edge was a rampart much smaller in size than the one just noticed, while the series was completed by a third mound, approaching in its dimensions the larger of the other two, and raised at nearly the same distance as it from the centre of the included ditch.

Along the wall, at intervals averaging 4 miles, were stationary camps strongly fortified. According to the *Notitia Utriusque Imperii*, which contains a brief record of the civil and military arrangement of the empires of the

Plan of Hadrian's Wall.

East and West, and is supposed to have been compiled in the beginning of the 5th century of our era, there were 23 such stations. The names given areas follows:—Segedunum (Wallsend), Pons Ælii (Newcastle), Condercum (Benwell Hill), Vindobala (Rutchester), Hunnum (Halton Chester), Cilurnum (Chesters), Procolitia (Carrowburgh), Boreovicus (Housesteads), Vindolana (Chesterholm), Æsica (Great Chesters), Magna (Carvoran), Amboglanna (Birdoswald), Petriana, Aballaba, Congavata, Axelodunum, Gabrosentum, Tunocelum, Glanuibanta, Alionis, Bremetenracum, Olenacum, and Virosidum. It is somewhat strange that not a trace of one of these names survives in the local vocabulary of the present day, though the exact positions of a number of the stations have been identified beyond all doubt by other means. The sites had been chosen with great care, and much labour must have been expended in their construction. They were in fact military cities, "suited," to use the words of Dr Bruce, "to be the residence of the chief who commanded the district, and providing secure lodgment for the powerful body of soldiery he had under him." It is not clear, however, that more than 18 of the 23 were situated *per lineam valli*, the others being probably supporting stations. The Wall was further strengthened by quadrangular buildings called mile-castles as well as by smaller watch-towers or sentry-boxes of stone; while connecting the whole was a military way made in Roman fashion and protected by the other parts of the fortification. By means of this road the garrisons of the different stations

could be quickly and safely concentrated on any point along the line that was threatened by an enemy. "It is sometimes asked," remarks the authority just quoted, "How long would the Wall be in building? From calculations that have been made, founded upon the experience gained by the construction of the vast works connected with modern railways, it is considered that, in the existing circumstances of the country at the time, the *Vallum* and the *Murus* could not be reared in a shorter period than 10 years. The cost of it in our present currency would be about £1,000,000. Above 10,000 men would be required to garrison its stations" (*Wallet Book of the Roman Wall*, p. 37).

Several of the ancient writers allude to ramparts and lines of forts raised by the Romans across the island during the time they had a footing in it. Of these notices some refer to the barrier on the isthmus of the Forth and Clyde (see ANTONINUS, WALL OF, vol. ii. p. 139); the others probably apply to the more important works now described. In his *Agricola* Tacitus states that the Roman general during his operations in the north of England (79 A.D.) compelled many states hitherto hostile to lay down their arms and surrounded them with garrisons and castles. A hundred years later two contemporary historians, Dion Cassius (as abridged by Xiphiline) and Herodian, writing of events in Britain that occurred in their own day, both notice—the former in two places—the existence of a wall in Britain, separating the Roman territory from the uncon-

quered tribes that dwelt beyond; but neither of them mentions when or by whom it was built. Another century onwards and Spartian, one of the *Scriptores Historie Augustæ*, states that the emperor Hadrian was the first to rear a wall across Britain (circa 120 A.D.) as a defence against the northern barbarians. It was, he adds, 80 miles in length. The same author in his life of Severus tells us that emperor also raised a wall from sea to sea (circa 203 A.D.). Aurelius Victor, who flourished about the year 360 A.D., ascribes to Severus the building of a wall in Britain, employing almost the words of Spartian; while his contemporary, Eutropius, makes a similar statement, adding, however, that this rampart was 32 (according to another reading, 132) miles long, and erected for the defence of certain portions of the country, which Severus had reconquered for Rome. Another possible wall-builder is introduced to us in the early years of the 5th century by the poet Claudian, who represents Britain as indebted to Stilicho, the successful general of the emperors Theodosius I. and Honorius, for some protection of this nature against the attacks of the Scots, Picts, and Saxons. Lastly, Gildas, our earliest native historian, asserts that the Britons themselves built a wall to aid them in warding off the assaults of the Picts and Scots, and that another was constructed by the Romans with native assistance, just before their final abandonment of the island. Both statements are repeated by Bede, who identifies the former of these structures with Antonine's wall and the latter with the more famous fortification near his own monastery of Jarrow.

Founding on such unsatisfactory if not conflicting data, modern writers have been led to give various answers to the questions—When and by whom was the Roman Wall built? The limits of the present article do not admit of any discussion of the subject, and those who wish to see these questions fully examined, as well as to read an account of the inscriptions and other antiquities discovered from time to time along the line of the Wall, are referred to the list of works given below, more especially to Dr J. C. Bruce's exhaustive treatise. For others the following summary may be sufficient.

Gordon, to whom we owe one of the earliest surveys of the Wall, is of opinion that the Vallum was the work of Hadrian, and the Murus of Severus. Horsley believed that the stations and the northern rampart of the Vallum were raised by Agricola, the ditch of the Vallum and its remaining mounds by Hadrian, and the stone wall with its castles, towers, and its great military way by Severus. Dean Merivale, while admitting that camps and mounds may have been erected on the isthmus by Hadrian and Severus, supposes that the stations were faced with masonry and the work planned as well as partly executed by Theodosius, his designs being afterwards fully carried out about 400 A.D. by Stilicho, in orders issued from Gaul. But others, and foremost among them Dr Bruce, see in the fortification a unity of design that points it out as the work of one period and one mind, and have come to the conclusion that Hadrian was the builder of the whole. This view, as it does not exclude the probability that his engineers worked to some extent on lines already laid down by Agricola, and that Severus, before entering on his unfortunate campaign against the Caledonians, or after its close, repaired and strengthened the works of his predecessors, seems most consistent with the statements of ancient writers, with the testimony of inscriptions, and with the appearances presented by the relative position of the component parts of the fortification itself.

See Gordon's *Itinerarium Septentrionale*, London, 1727; Horsley's *Britannia Romana*, London, 1732; Hutton's *History of the Roman Wall*, London, 1813; Hodgson's *Roman Wall*, &c., Newcastle, 1841; M'Lauchlan's *Survey of the Roman Wall*, made in the years 1852-54; Bruce's *Roman Wall*, 3d ed., London, 1863. (J. M'D.)

HADRUMETUM, or ADRUMETUM (the name appears in the Greek writers in a great variety of forms—'Αδρῦμη, 'Αδρῦμης, 'Αδρῦμης, 'Αδρῦμης, 'Αδρῦμης, 'Αδρῦμης), a city on the African coast of the Mediterranean on the Sinus Neapolitanus or Gulf of Hamamet. A Phœnician colony of earlier date than Carthage, in course of time it became subservient to the imperial city, and fell along with it under the power of the Romans. On the subdivision of the Roman province of Africa Propria, it became the capital of Byzacium. By Trajan it was made a colony, as is evidenced by the grandiloquent inscriptions preserved by Gruter—*Col. Concordia Ulpia Trajana Augusta Frugifera Hadrumetina*. From the devastation inflicted by the Vandals it was restored by Justinian, and in consequence it bore for some time the name of Justinianopolis.

The identification of Hadrumetum is a matter of some difficulty. Most modern authorities agree in fixing it at Susa, but others contend that Hamamet is the true site. Hitherto no inscription has been discovered which satisfactorily settles the point in favour of either; for the fragments that are appealed to for the identification of Hamamet with Saigitia may possibly have been brought to the place of their discovery. The arguments in favour of each may be thus summarized. Susa agrees remarkably well, as Maltzan elaborately maintains, with the position assigned to Hadrumetum by the *Notitia* and other ancient works in which the distances from place to place are given. The remains of ancient buildings, though few, prove undoubtedly that Susa is the site of some city of considerable importance, and the ruins now known as Makluba or the Fallen may be those of a great temple. We know that in the time of El-Bekri Susa still possessed a cothon or inner harbour (one of the chief features of Hadrumetum as described by the author of the *African War*), which may be recognized in the existing sandy plain 1500 feet wide between the two ancient moles, now distinguished as the Quarantine Mole and Pointe du Mole. The figures found by M. Daux (*Journ. Asiat.*, 1868) would of themselves have suggested that Susa was a Phœnician colony. Barth suggests that the name Susa is probably a corruption of Σάσωσα. In favour of Hamamet Mr J. E. Davis argues that the scenery near Susa agrees with that of Ruspina described by the author of the *African War*; that the absence of ruins at Hamamet is accounted for by the clouds of sand swept down upon the site; that there are clear traces of a cothon at Hamamet; and that the modern name Haimamet or Tent of Death corresponds exactly with the hypothetical Hedermot or Chamber of Death of the Phœnicians. On the whole the argument appears to be on the side of Susa.

For further details see Barth, *Wanderungen durch die Küstländer des Mittelmeeres*, 1840; Guérin, *Voyage archéologique dans la Régence de Tunis*, 1862; Nathan Davis, *Ruined Cities*, 1862; Maltzan, *Reise in der Regentschaften Tunis und Tripoli*, 1870.

HÆMORRHOIDS (from αἷμα, blood, and ῥέω, to flow), commonly called piles, a frequent and distressing malady. Two varieties are described. They are named from their situation external and internal, as they are without or within the opening of the anus. The external pile is an overgrowth of the thin dark-coloured skin round the opening; there is most frequently more than one present; the skin, lax and redundant, hangs in folds. The internal pile lies altogether within the opening, although it may appear externally protruding through the anus when any pressure from above is applied, as when the patient strains at stool. It is covered by, and composed of an overgrowth of, the mucous membrane lining the bowel. There may be several internal piles. The internal pile is sessile or pedunculated. The external pile is of a pale colour. The internal pile is moist, vascular, and of a cherry-red colour; it is apt to inflame, and the inflammation is associated with heat, pain, and general uneasiness. Ulceration and bleeding are common symptoms of the internal pile, hence the term "bleeding" or "bloody piles." Both varieties are probably due to the same primary cause—an enlargement of the veins in this region. Any cause which, by pressing on the large abdominal veins, retards the upward flow of blood to the heart will give rise to piles; such are constipation, disease of the liver, pregnancy. General weakness involving a want of tone in the blood-vessels may act as a predisposing cause. The exciting cause is frequently exposure to damp,

as from sitting on the wet ground. Piles are only a symptom, and in their treatment this should be kept in view; remove the cause and the piles will disappear. The local treatment is palliative or radical. The palliative treatment consists in attention to the state of bowels, cold bathing, astringent injections, lotions, and ointments. The radical treatment consists in their removal; the external pile is cut off, the internal pile is tied or clamped and cauterized. Both methods have their advocates; the radical treatment should not be undertaken until palliative treatment has failed. When in a state of inflammation the treatment consists in hip baths, hot fomentations, and poultices. The introduction of a morphia suppository often relieves the uneasiness. Both varieties are often met with in the same individual; when this is the case both should be removed by operation at one time. The internal piles are apt to return if the predisposing cause is still in existence. Piles are apt to be confounded with other surgical diseases in this region, as fissure or ulcer, prolapse, polypus, or cancer. This is not the place to point out the distinguishing features of these different maladies; the patient should consult a surgeon. There is a form of pile situated just at the verge of the anus, where the skin joins the mucous membrane: its onset is sudden, and due to the rupture of a blood-vessel; the blood is extravasated and clots; a small, tense, painful swelling of a bluish colour is seen at the edge of the anus. This may be relieved by hot fomentations, or the pile may be laid open and the clot turned out by gentle pressure.

HÁFIZ. Muhammed Shamsuddin, better known by his *takhallus* or "nom de plume" of Háfiz, was one of the most celebrated writers of Persian lyrical poetry. He was born at Shiraz, the capital of Fars, in the early part of the 8th century of the Mahometan era, that is to say, in the 14th of our own. The exact date of his birth is uncertain, but he is known to have attained a ripe old age and to have died in 791 A.H. (1388 A.D.). This is the date given in the chronogram which is engraved on his tomb, although several Persian biographers give a different year. Very little is actually known about his life, which appears to have been passed in quiet retirement and literary ease in his native city of Shiraz, of which he always speaks in terms of affectionate admiration. He was a subject of the Muzaffar princes, who ruled in Shiraz, Yazd, Kirman, and Isfahan, until the dynasty was overthrown by Timur-lang (Tamerlane). Of these princes his especial patrons were Shah Shujá' and Shah Mansúr. He early devoted himself to the study of poetry and theology, and also became learned in mystic philosophy, which he studied under Shaikh Mahmúd 'Attár, chief of an order of dervishes. Háfiz afterwards enrolled himself in the same order and became a professor of Koranic exegesis in a college which his friend and patron Haji Kiwam-uddin, the vizier, specially founded for him. This was probably the reason of his adopting the *sobriquet* of Háfiz, which means "one who remembers," and is technically applied to any person who has learned the Koran by heart. The restraints of an ascetic life seem to have been very little to Háfiz's taste, and his loose conduct and wine-bibbing propensities drew upon him the severe censure of his monastic colleagues. In revenge he satirizes them unmercifully in his verses, and seldom loses an opportunity of alluding to their hypocrisy and religious pretensions. Háfiz's fame as a poet was soon rapidly spread throughout the Mahometan world, and several powerful monarchs sent him presents and pressing invitations to visit them. Amongst others he was invited by Mahmúd Shah Bahmani, who reigned in the south of India, and set off with the intention of sojourning at the court of that sovereign. After crossing the Indus and passing through Lahore he reached Ilrumuz, and embarked on board a

vessel sent for him by the Indian prince. He seems, however, to have been a bad sailor, and, having invented an excuse for being put ashore, made the best of his way back to Shiraz. Some biographies narrate a story of an interview between Háfiz and the invader Timur. The latter sent for him and asked angrily, "Art thou he who was so bold as to offer my two great cities Samarcand and Bokhara for the black mole on thy mistress's cheek," alluding to a well-known verse in one of his odes. "Yes, sire," replied Háfiz, "and it is by such acts of generosity that I have brought myself to such a state of destitution that I have now to solicit your bounty." Timur was so pleased at the ready wit displayed in this answer that he dismissed the poet with a handsome present. Unfortunately for the truth of this story Timur did not capture Shiraz till 1393 A.D., while the latest date that can be assigned to Háfiz's death is 1391. Of his private life little or nothing is known. One of his poems is said to record the death of his wife, another that of a favourite unmarried son, and several others speak of his love for a girl called *Shákh-i Nabat*, "Sugar-cane branch," and this is almost all of his personal history that can be gathered from his writings. He was, like most Persians, a Shiah by religion, believing in the transmission of the office of Imám, or head of the Muslim Church in the family of Ali, cousin of the prophet, and rejecting the *Hadith*, or traditional sayings of Mahomet, which form the Sunneh or supplementary code of Mahometan ceremonial law. One of his odes which contains a verse in praise of Ali is engraved on the poet's tomb, but is omitted by Sudi, the Turkish editor and commentator, who was himself a rigid Sunni. The same sectarian bigotry has influenced many other editors, and it is no unusual thing to find an Indian edition of the *Diván* emasculated by the excision of all the passages which can be construed as having the slightest allusion to the objects of Shiah veneration. That his tendencies were towards a rather extravagant and heretical form of theosophy may be deduced from his writings, and in one verse he even goes so far as to speak in terms of admiration of one Mansúr of Halláj who was hanged, after being put to the most horrible tortures, on a charge of blasphemy, 309 A.H. This person professed a creed nearly approaching pure pantheism, and went about asserting that he was himself an incarnation of the omnipresent divinity, saying, *Ana 'l-Hakk*, "I am the Truth!" Háfiz in allusion to this says that his only fault was that he revealed the mystery. These heretical opinions and the dissipated life of the poet caused difficulties to be raised by the ecclesiastical authorities on his death as to his interment in consecrated ground. The question was at length settled by Háfiz's own works, which had then already begun to be used as they are now throughout the East for the purposes of divination, in the same manner as Virgil was employed in the Middle Ages for the divination called *Sortes Virgilianæ*. Opening the book at random after pronouncing the customary formula asking for inspiration, the objectors hit upon the following verse—"Turn not away thy foot from the bier of Háfiz, for though immersed in sin, he will be admitted into Paradise." He was accordingly buried in the centre of a small cemetery at Shiraz, now included in an enclosure called the Háfiziyeh.

His principal work is the *Diván*, that is, a collection of short odes or sonnets called *ghazals*, and consisting of from five to sixteen *baits* or couplets each, all the couplets in each ode having the same rhyme in the last hemistich, and the last couplet always introducing the poet's own *nom de plume*. The whole of these are arranged in alphabetical order, an arrangement which certainly facilitates reference but makes it absolutely impossible to ascertain their chronological order, and therefore deteriorates from their value as a means of throwing light upon the growth and develop-

ment of his genius or the incidents of his career. These "orient pearls at random strung," as a version of a passage from Háfiz in Sir William Jones's grammar calls them, are often held together by a very slender thread of continuous thought, and very few editions agree exactly in the order of the couplets which form the individual ghazals. Still, although they often appear at first sight extremely disconnected, a careful study of them, especially from the point of view indicated by the Sufistic system of philosophy, will always show that a single idea does run throughout the whole. The nature of these poems has been the subject of much discussion in the West, some scholars seeing in their anacreontic utterances nothing but sensuality and materialism, while others, following the Oriental school, maintain that they are wholly and entirely mystic and philosophic. Something between the two would probably be nearer the truth. It must be remembered that Háfiz was a professed dervish and Súfí, and that his ghazals were in all probability published from a *takia*, and arranged with at least a view to Sufistic interpretation. At the same time it is ridiculous to suppose that the glowing imagery, the gorgeous and often tender descriptions of natural beauties, the fervent love passages, and the roystering drinking songs were composed in cool blood or with deliberate ascetic purpose. The beauty of Háfiz's poetry is that it is natural. It is the outcome of a fervent soul and a lofty genius delighting in nature and enjoying life; and it is the poet's misfortune that he lived in an age and amongst a people where rigid conventionality demanded that his free and spontaneous thoughts should be recast into an artificial mould.

The system of philosophy professed by Persian poets and dervishes, and in accordance with which the poems of Háfiz are allegorically interpreted, is called Sufism (*Tasawwúf*). It is derived usually from the word *súf*, which in Arabic means wool, and is supposed to refer to the woollen robes worn by the dervishes, although it is in all probability connected with the Greek *σοφός*. It is the ultimate outcome of the protest of the conquered Aryan nations against the laws, ceremonials, and ideas of their Semitic conquerors, which first found expression in the schism of the Shiáhs, that is, of the Persian party who sided with the family of Ali Ibn Abi Talib, cousin and son-in-law of Mahomet, against the claims of Moawiyeh, who at the head of the Arab party claimed and held the caliphate. Forced by events to accept el Islam, and compelled to forsake the Magian and Zoroastrian faiths, the Persian Shiáhs rapidly developed a system which, while teaching openly the unity of God according to Moslem doctrine, secretly theorized and refined it away, until Pantheism became the esoteric religion of the sect. It teaches that God is the only real existence and that all other existences are hypothetical, that God existed alone and created the universe merely by His Will and by the utterance of the word "Be." The "Will" or "Order" and the "Be" are closely allied to the "Spirit" and "Word" of Christian theology. Man, the highest purpose of this creation, is therefore part and parcel of the Deity, and when sufficiently purified from the lower and grosser elements returns to his source again. The circle of existence thus imagined is looked upon as a road which all must travel, and this image is kept up throughout the terminology of the sect. Thus the doctrine is *tarikát* (the road), the student or disciple is the *sálik* (wayfarer), and the different stages of perfection are *manzilhá* (road-side stations or inns). And since all differences in sect and religion are as nothing to the illumined philosopher who is initiated into this mystery, and as the contemplation of the divinity of his own existence and of his ultimate resumption of his place as part and parcel of the Deity produces ecstacy and mental exaltation, and inasmuch as everything

that is beautiful, lovable, and pure is a purer and clearer manifestation of the Deity that runs through all,—therefore the Sufis speak of their real worship as paganism, their real devotion as love and drunkenness, and see a divine mystery in every phase of beauty in humanity or inanimate nature.

Besides the *Diván*, Háfiz wrote a number of other poems; the Leipzig edition of his works contains 573 *ghazals* (forming the *Diván*), 42 *kitáhs* or fragments, 69 *rubáiyát* or tetrastrics, 6 *masnaviyát* or poems in rhyming couplets, 2 *kasáid*, idylls, or panegyrics, and one *mukhammas* or poem in five-line strophes. Other editions contain several *tarji-band* or poems with a refrain. His works have never been completely translated into English; a few rhyming versions of single poems by Sir William Jones, Nott, Hindley, Falconer, &c., are to be found scattered through the pages of the *Oriental Miscellany* and other periodicals, and a fine edition containing a verse rendering of the principal poems by the late H. Bicknell is published by Trübner and Co. (London, 1875). A prose version of a hundred selected odes was also published anonymously by Williams & Norgate (London, 1875). On the Continent the principal versions are by Von Hammer Purgstall; a rhyming and rhetorical translation of a large portion of Háfiz's works by Von Rosenzweig of Vienna (3 vols. 8vo, Vienna, 1858), which contains also the Persian text and notes; *Der Divan des Schems-eddin Muhammed Hafiz*, by Nesselmann (Berlin, 1875), in which the rhyming system of the original is imitated. Besides these, the reader may consult D'Herbelot, *Bibliothèque Orientale*, article "Hafiz;" Sir William Ouseley's *Oriental Collection* (3 vols. 4to, London, 1797-98); *Specimens of Persian Poetry, or Odes of Hafiz*, by John Richardson. (London, 1802); *Biographical Notices of Persian Poets*, by Sir Gore Ouseley (Oriental Translation Fund, 1846); and an excellent article by Professor E. B. Cowell in *Macmillan's Magazine* (No. 177, July 1874). The best edition of the text is perhaps that edited by Hermann Brockhaus of Leipzig, 1854, which is based on the recension of the Turkish editor Sudi, and contains his commentary in Turkish on a considerable portion of the *Diván*. (E. H. P.)

HAGEDORN, FRIEDRICH VON (1708-1755), one of the most distinguished German poets in the earlier half of last century, was born April 23, 1708, at Hamburg, where his father was Danish minister at the court of Lower Saxony. The father, a man of scientific and literary tastes, possessed a valuable library of French literature, and dabbled also in the science of alchemy. Having by this and other means lost a great part of his fortune, he died in 1722, leaving in poor circumstances a widow and two sons, of whom the poet was the elder. He was educated at the gymnasium of Hamburg, and went later (1726) to study jurisprudence at Jena. Shortly after his return to Hamburg in 1729, he obtained the appointment of private secretary without salary to the Danish ambassador in London, where he lived till 1731, and published two small works in English. His return to Hamburg was followed by a period of great poverty and hardship, a scanty income being derived from the posts which he held in the Hamburg cathedral and among the mining population in Klausthal. In 1733 Hagedorn became secretary to the so-called "English court" in Hamburg, a trading company founded in the 13th century, and formerly known as "Die Societät der Aventurier Kaufleute." He shortly afterwards married, and from this time, with a settled income and sufficient leisure to pursue his literary occupations, led a pleasant and congenial existence, surrounded by friends and admirers, till his death, at the early age of forty-seven, October 28, 1755.

Hagedorn is known as the author of satirical, didactic, and moral verses, epigrams, odes, fables, and songs. His popularity during his lifetime was great. Although he held himself aloof from any poetical school, he nevertheless exercised an important influence on the German poetry of his time; for, besides being a learned man and well-read in the ancient and modern classics, he was a special admirer of French literature, the study of which gained for him an ease and mobility before unknown in German versification. He has been called the originator in Germany of the modern song, and some of his *Lieder* were set to music by the favourite composers of his day. His popularity, how-

ever, is now long past. His learning and his style have been eclipsed by later and greater poets, and he who was at one time the "allgemeine Bewunderung von Deutschland" now ranks only among the secondary German classics.

The first collection of Hagedorn's poems was published at Hamburg shortly after his return from Jena in 1729, under the title *Versuch einiger Gedichte, oder erlesene Proben poetischer Nebenstunden*. In 1738 appeared *Versuch in poetischen Fabeln und Erzählungen*; in 1747 a collection of his lyric poems, under the title *Sammlung neuer Oden und Lieder*; and his *Moralische Gedichte* in 1750. A collection of his entire works was published at Hamburg after his death in 1756, and a smaller edition in 1767. The best is Eschenburg's edition, 5 vols., 1800, republished, with Hagedorn's correspondence, in 1825. — See C. H. Schmid, *Biographie von Hagedorn*.

HAGEN, a town of Prussia, at the head of a circle in the Arnsberg government of Westphalia, is situated at the confluence of the Empe with the Volme, and at the junction of several railways, 26 miles W.S.W. from Arnsberg. It is the seat of a provincial office, a circle court, a chamber of commerce, a state railway commission, and an agricultural union. It has two Evangelical churches, a Catholic church, an Old Catholic church, a synagogue, a real-school of the first order, a royal provincial trade school, a higher female school, and two infirmaries. Hagen is one of the most flourishing commercial towns in Westphalia, and possesses puddling works for iron and steel, iron foundries, cast-steel works, a large cotton print work, woollen and cotton factories, manufactures of leather, paper, tobacco, and iron and steel wares, breweries, and distilleries. There are large limestone quarries in the vicinity, and also an alabaster quarry. The population in 1875 was 24,335, or including Althagen 26,870.

HAGEN, FRIEDRICH HEINRICH VON DER (1780–1856), distinguished for his researches in Old German literature, was born at Schmiedeberg in Brandenburg, 19th February 1780. After studying law at the university of Halle, he obtained a legal appointment in the state service at Berlin, but in 1806 he resigned this office in order to devote himself exclusively to the study of his choice. In 1810 he was appointed professor extraordinarius of German language and literature in the university of Berlin, in the following year was transferred to a similar professorship in Breslau, and in 1821 returned to Berlin as professor ordinarius. He died at Berlin, 11th June 1856. To Hagen belongs the chief merit of awakening an interest in Old German poetry, of which he published several collections.

His principal publications are the *Nibelungenlied*, of which he issued four editions, the first in 1810 and the last in 1842; the *Minnesinger*, Leipzig, 1838–52, 5 vols.; *Lieder der ältern Edda*, Berlin, 1812; *Alt nordische Lieder und Sagen*, Breslau, 1814; a collection of Old German tales under the title *Gesamltubenteuer*, Stuttgart, 1850, 3 vols. He also published *Ueber die ältesten Darstellungen der Faustusage*, Berlin, 1844; and from 1835 he edited the *Jahrbuch der Berlinischen Gesellschaft für deutsche Sprache und Alterthumskunde*.

HAGENAU, the chief town of a circle and canton in Alsace-Lorraine, Germany, district of Lower Alsace, is situated in the middle of the Hagenau Forest, on the Moder, and on the railway from Strasburg to Weissenburg, 10 miles N.N.E. of the former town. It has two ancient Catholic churches, one dating from the 12th the other from the 13th century, a gymnasium, a reformatory for boys, a female penitentiary, a public library, a hospital, and a theatre. The principal industries are wool and cotton spinning, and the manufacture of porcelain, earthenware, soap, leather, oil, and beer. There is also considerable trade in hops, vegetables, and wine. Population (1875), 11,786.

Hagenau dates from the beginning of the 12th century, and owes its origin to the erection of a hunting lodge by the dukes of Swabia. Frederick Barbarossa surrounded it with walls and gave it a constitution. On the site of the hunting lodge he founded an imperial palace, in which were preserved the jewelled imperial crown, sceptre, imperial globe, and sword of Charlemagne. Subsequently

the town obtained imperial rights, and after the extinction of the Hohestaufens it remained the capital of the bailiwick of Lower Alsace. In 1648 it came into the possession of France, and in 1673 Louis XIV. caused the fortifications to be razed. In 1675 it was captured by imperial troops, but in 1677 it was retaken by the French and nearly all destroyed by fire. In 1871 it came, along with the rest of Alsace-Lorraine, into the possession of Prussia.

HAGENBACH, KARL RUDOLF (1801–1874), distinguished as a church historian and as an expounder of the so-called "Vermittelungstheologie," or mediation theology of Germany, was born March 4, 1801, at Basel, where his father, a man of considerable talent and scientific repute, was a practising physician. His preliminary education was received at a Pestalozzian school, and afterwards at the gymnasium, whence in due course he passed to the newly reorganized local university. Carefully brought up within a church in which the strictest orthodoxy still continued to hold undisputed sway, familiar at the same time from boyhood with his father's expressions of approval of the principles of the French Revolution, himself of an ardent, sympathetic, inquiring, and devout temperament, he early devoted himself to theological studies and to the service of the church, while at the same time cherishing and developing broad "humanistic" tendencies which found expression in many ways and especially in an enthusiastic admiration for the writings of Herder. The years 1820–23 were spent first at Bonn, where Lücke exerted a powerful influence on the formation of his opinions, and afterwards at Berlin, where Schleiermacher, and still more Neander, became permanently his masters. Returning in 1823 to Basel, where De Wette had recently been appointed to a theological chair, he distinguished himself greatly by his "habilitationsschrift" or trial-dissertation, entitled *Observationes historico-hermeneuticæ circa Origenis methodum interpretandæ sacræ Scripturæ*; in the following year he became professor extraordinarius, and in 1829 professor ordinarius of theology. Apart from his special academic labours during many years in connexion with the history of dogma and of the church (which first owed to him their recognition as distinct branches of study at Basel), he lived a life of great and varied usefulness as a theologian, a preacher, and a citizen; and at his "jubilee" in 1873, not only the university and town of Basel but also the various churches of Switzerland united to do him honour. He died at Basel, June 7, 1874.

Hagenbach was a voluminous author in many departments (as will be seen from the list of his works which is given below), but it is as a writer on church history that he is specially distinguished, and is likely to be longest and most widely known. Though neither so learned and condensed as the contributions of Gieseler, nor so original and profound as those of Neander, his lectures are written with remarkable clearness and attractiveness, and are deservedly appreciated at once for their warm glow of sympathy with his subject and for their entire freedom from narrow sectarian prejudices. In dogmatics, while avowedly a champion of the "mediation theology" based upon the fundamental conceptions of Herder and Schleiermacher, he was much less revolutionary in his aims and in his results than were many others of his school. To the last he sought to maintain the old confessional documents, and to make the objective and churchly prevail over the purely subjective manner of viewing theological questions. But he himself was aware that in the endeavour to do so he was not always successful, and that his delineations of Christian dogma often betrayed a vacillating and uncertain hand. His works include a remarkably clear *Tabellarische Uebersicht der Dogmengeschichte* (1828); *Encyclopædie u. Methodologie der theol. Wissenschaften* (1833); *Vorlesungen über Wesen u. Geschichte der Reformation u. des Protestantismus* (1834–43); *Lehrbuch der Dogmengeschichte* (1840–41, 5th ed., 1867; English transl., 1850); *Vorlesungen über die Geschichte der alten Kirche* (1853–55); *Vorlesungen über die Kirchengeschichte des Mittelalters* (1860–61); *Grundlinien der Homiletik u. Liturgik* (1863); also biographies of Ecolampadius and Myconius and a *Geschichte der theol. Schule Basels* (1860). His *Predigten* have been published in nine volumes (1858–76), and he is also author of two volumes of poems entitled *Luther u. seine Zeit* (1838), and *Gedichte* (1846). The lectures on church history under the general title *Vorlesungen über die Kirchengeschichte von der ältesten Zeit bis zum 19ten Jahrhundert* have been recently reissued in seven volumes (1868–72).

HAGERSTOWN, a city and township of Maryland, United States, capital of Washington county, is situated near the west bank of Antietam creek, 20 miles from its confluence with the Potomac river, and at the junction point of three railways, 86 miles W.N.W. by rail from Baltimore. It is a well-built town with very few wooden houses, and possesses a fine new court-house, a male and a female academy, and a national and a state bank. It depends for its prosperity chiefly on agriculture, and has flour-mills, bone-mills, machine shops, and a tannery, and considerable trade in agricultural produce. The population in 1850 was 3884; in 1860, 4132; and in 1870, 5779, of whom 869 were coloured.

HAG-FISH, GLUTINOUS HAG, or BOREZ (*Myxine*), a marine fish which forms with the lampreys one of the lowest orders of vertebrates (*Cyclostomata*). Similar in form to a lamprey, it is usually found within the body of dead cod or haddock, on the flesh of which it feeds after having buried itself in the abdomen. When caught, it secretes a thick glutinous slime in such quantity that it is commonly believed to have the power of converting water into glue. It is occasionally found in the North Atlantic and other temperate seas of the globe.

HAGGAI, the tenth in order of the minor prophets. The name Haggai (חַגַּי, Greek Ἀγγαῖος, whence Aggeus in the English version of the Apocrypha) is usually held to be an adjective meaning *festive*. But Wellhausen¹ is probably right in taking the word as a contraction for Hagariah (*Jehovah hath girded*), just as Zaccai (Zacchæus) is known to be a contraction of Zechariah (*cf.* Derenbourg, *Histoire de la Palestine*, pp. 95, 150).

The book of Haggai contains four short prophecies delivered between the first day of the sixth month and the twenty-fourth day of the ninth month—that is, between September and December—of the second year of Darius the king. The king in question must be Darius Hystaspis, who came to the throne 521 B.C. Scaliger, Drusus, and other older writers think of Darius Nothus (*acc.* 424 B.C.); but this is impossible, since in chap. ii. 3 Haggai speaks of old men as still alive who had seen the first temple in its splendour before 587 B.C.² The language of the prophet suggests the probability that he was himself one of those whose memories reached across the seventy years of the captivity, and that his prophetic work began in extreme old age. This supposition agrees well with the shortness of the period covered by his book, and with the fact that Zechariah, who began to prophesy in the same autumn and was associated with Haggai's labours (*Ezra* v. 1), afterwards appears as the leading prophet in Jerusalem (*Zech.* vii. 1-4). We know nothing further of the personal history of Haggai from the Bible. Later traditions may be read in Carpzov's *Introductio*, pars 3, cap. xvi. On the mention of Haggai in the titles of several psalms in the Septuagint (*Psalms* cxxxvii., cxlv.-cxlviii.) and other versions, see Koehler's *Weissagungen Haggai's*, p. 32. These titles are without value, and moreover vary in MSS. Eusebius did not find them in the Hexaplar Septuagint.³

In his first prophecy (i. 1-11) Haggai addresses Zerubbabel and Joshua, rebuking the people for leaving the temple unbuilt while they are busy in providing panelled houses for themselves. The prevalent famine and distress are due to God's indignation at such remissness. Let them build the house, and God will take pleasure in it and

acknowledge the honour paid to Him. The rebuke took effect, and the people began to work at the temple, strengthened by the prophet's assurance that the Lord was with them (i. 12-15). In a second prophecy (ii. 1-9) delivered in the following month, Haggai forbids the people to be disheartened by the apparent meanness of the new temple. The silver and gold are the Lord's. He will soon shake all nations and bring their choicest gifts to adorn His house. Its glory shall be greater than that of the former temple, and in this place He will give peace. A third prophecy (ii. 10-19) contains a promise, enforced by a figure drawn from the priestly ritual, that God will remove famine and bless the land from the day of the foundation of the temple onwards. Finally, in ii. 20-23, Zerubbabel is assured of God's special love and protection in the impending catastrophe of kingdoms and nations to which the prophet had formerly pointed as preceding the glorification of God's house on Zion. In thus looking forward to a shaking of all nations Haggai agrees with earlier prophecies, especially *Isa.* xxiv.-xxvii., while his picture of the glory and peace of the new Zion and its temple is drawn from the great anonymous prophet who penned *Isa.* lx. and lxi. The characteristic features of the book are the importance assigned to the personality of Zerubbabel and the almost sacramental significance attached to the temple. The hopes fixed on Zerubbabel, the chosen of the Lord, dear to Him as His signet ring (*cf.* *Jer.* xxii. 24), are a last echo in Old Testament prophecy of the theocratic importance of the house of David. In the book of Zechariah Zerubbabel has already fallen into the background and the high priest is the leading figure of the Judean community.⁴ The stem of David is superseded by the house of Zadok, the kingship has yielded to the priesthood, and the extinction of national hopes gives new importance to that strict organization of the hierarchy for which Ezekiel had prepared the way by his sentence of disfranchisement against the non-Zadokite priests.

If his attitude to Zerubbabel forms a link of connexion between Haggai and the prophets before the captivity, his post-exile standpoint is characteristically marked in the central importance which he attaches to the temple. The prophets who spoke under the shadow of the first temple held quite another language.⁵ To Isaiah and Jeremiah the religion of Israel and the holiness of Jerusalem have little to do with the edifice of the temple. The city is holy because it is the seat of Jehovah's sovereignty on earth, exerted in His dealings with and for the state of Judah and the kingdom of David. The proof that Jehovah's throne is in Jerusalem lies in the history of what He has done for His people, or, if a visible pledge is needed, it must be sought not in the temple but, in accordance with antique ideas, in the ark (*Jer.* iii. 16) or in the altar with its sacred flame (*Isa.* xxix. 1; xxxi. 9).⁶ But, in the desolation of Jerusalem, the extinction of the political life with which all religion had till then been inseparably bound up gave a new meaning to the old prophetic doctrine that the service of Jehovah is the true vocation of Israel—a new significance to the ruined temple and all its ordinances of worship. "The holy and beautiful house where our fathers praised Thee" (*Isa.* lxi. 11) was a chief thought of the sorrowing exiles (*Lamentations*, *passim*), and to one anonymous writer the Lord's vengeance on Babylon appears eminently as vengeance for His temple (*Jer.* l. 28). The great prophet of the captivity—the author of *Isa.* xl.—

¹ In Bleek's *Einleitung*, 4th ed., p. 434.

² Darius Nothus was thought of because *Ezra* iv. 6-23 seems to require an Artaxerxes before him. But it is now generally admitted that these verses refer to the building of the wall of Jerusalem, and in chronological order should follow chaps. v., vi. The Rabbinical commentators with their usual ignorance on points of history make Darius the son of Ahasuerus and Esther.

³ See the note on *Ps.* cxlv. i. in Field's *Hexapla*.

⁴ After the foundation of the temple Zerubbabel disappears from history and lives only in legend, which continued to busy itself with his story, as we see from the apocryphal book of *Esdras* (*cf.* Derenbourg, *Hist. de la Palestine*, chap. i.).

⁵ Compare for example *Jer.* vii.

⁶ Haggai (ii. 14) attaches no value to altar and sacrifice so long as the temple is unbuilt.

xvi.—pictures the Israel of the restoration no longer as an earthly state but as a world-priesthood, a mediatorial people gathered round the sanctuary and holding forth amidst the nations the true pattern of the knowledge and service of the living God till all the ends of the earth shall look to Him and be saved. Under the limitations of the old dispensation neither seer nor people could separate the realization of this great conception from the restoration of the visible centre of Israel's worship in the temple at Jerusalem. The prophet had pointed to Cyrus by name as the rebuilder of Jerusalem and the founder of the temple (Isa. xlv. 28; lli. 11); and the captives whose hearts were touched by his burning words, and who availed themselves of the decree of that monarch (536 B.C.) to repeople the desolate places of Judah, looked for the speedy advent of the time when the glory of Jehovah displayed in His house on Zion should draw to Jerusalem the willing homage of all nations (Isa. lvi. 7; lxvi. 1-6). The actual experiences of the returning exiles fell as far short of these bright hopes as the Israel of Zerubbabel and Joshua fell short of the ideal regenerate nation to which the prophet had promised the heritage of Jehovah's glory. Scarcely was a settlement effected when difficulties and misfortunes began to thicken about the little colony. The anger of the Lord seemed still to rest on Jerusalem and the cities of Judah (Zech. i. 12), whose inhabitants soon ceased to find favour from the Persian court, and had to struggle with penury and famine as well as with the hostility of their neighbours. Amidst such discouragements the first zeal soon grew cool, and the work of rebuilding the sanctuary lay practically untouched till Haggai arose sixteen years later.

What had actually been effected during these years for the restoration of the temple is a question of some difficulty. It seems safest to start from the explicit contemporary evidence of Hag. ii. 18 (cf. ii. 15 and Zech. viii. 9) which gives the ninth month of the second year of Darius—after Haggai had begun to preach—as the date when the temple was founded by Zerubbabel and Joshua. On the other hand, the book of Ezra, in its present shape as edited and partly composed by the much later author who wrote Chronicles, conveys the impression that large gifts for the temple were offered by the leading Jews on their first return (Ezra ii. 68, 69), that the foundation of the house was laid by Joshua and Zerubbabel in the second year of the return (ch. iii.), and that the work was thereafter interrupted by the opposition of the Jews' enemies till the reign of Darius. It appears probable, however, that the Chronicler has somewhat dislocated the order of events, especially by taking the official correspondence in ch. iv. to refer to the temple, whereas it really refers to the building of the city walls. This oversight might readily involve the antedating of the foundation ceremony described in iii. 8-13, which seems to be identical with that which Haggai speaks of, since the actors are the same, and the chief feature in the description which does not belong to the usual liturgical scenery of the Chronicler recalls Hag. ii. 3, Zech. iv. 7-10. Again, the verses Ezra ii. 68, 69 seem really to refer to a collection made in the time of Nehemiah, having been transcribed from a history of that period (part of which is preserved in the canonical book of Nehemiah) along with the ancient list which occupies the first part of Ezra ii. But they are not part of the list, as appears from a comparison of Ezra ii. 62-iii. 1 with Neh. vii. 64-viii. 1. If this criticism is just, the Tirshatha of Ezra ii. is Nehemiah, not Zerubbabel, and the usual arguments for identifying the latter with Sheshbazzar—whom Cyrus, according to an Aramaic source preserved in Ezra v., appointed governor and charged with the restoration of the temple—fall to the ground.¹ Sheshbazzar is presumably a Persian official; and the first hope of the Jewish colony, in accordance with Isa. xlv. 28, lx. 10, was, no doubt, that the Persians would effect the restoration without effort of theirs. This hope was frustrated; Sheshbazzar presumably having taken up his task with the usual conscientiousness of an Oriental governor, that is, having done nothing, though the work was nominally in hand all along (Ezra v. 16). The advancement of Zerubbabel to the governorship may have given Haggai his opportunity.

In the confused state of the chronology of the book of Ezra it may also be a question when the Samaritans sought to join the Jews and were repulsed. That the relation of Ezra iv. 1-4 is historical seems

¹ Ezra ii. 2 seems to show that at the return Zerubbabel was merely one of the Jewish elders. The opposite impression is due solely to the punctuation.

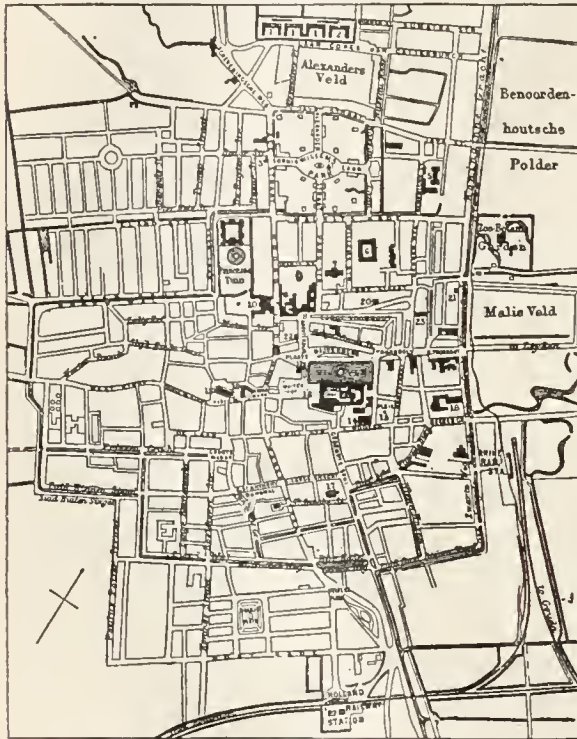

to be established against objections which have been taken to it by the reference to Esarhaddon, which A. v. Gutschmidt has vindicated by an ingenious historical combination with the aid of the Assyrian monuments (*Neue Beiträge*, p. 145). Compare also Jer. xli. 5 for the antiquity of the Samaritan claim to worship with the Jews. But from Ezra v., and especially from Zech. iii., it may be questioned whether the opposition of the Samaritans arose before the time of Haggai and Zechariah. See on the whole question Schrader, "Die Dauer des zweiten Tempelbaues," in the *Studien und Kritiken*, 1867.

Such indifference to the undertaking which held a chief place in the first ardour of the returning exiles had a deeper significance than at once occurs to our modern habits of thought. The restoration of the temple and its worship was connected in every mind with the doctrine that the service of Jehovah was the true national vocation of Israel, and the apathy that Haggai rebukes showed the people to have forgotten in the struggle for material welfare their ideal calling as the nation of the true God. His reproofs touched the conscience of the Jews, and the book of Zechariah enables us in some measure to follow the course of a religious revival which, starting with the restoration of the temple, did not confine itself to matters of ceremony and ritual worship. On the other hand, Haggai's treatment of his theme, practical and effective as it was for the purpose in hand, moves on a far lower level than the aspirations of the great evangelical prophet who inspired the people at their first return. To the latter the material temple is no more than a detail in the picture of a work of restoration eminently ideal and spiritual, and he expressly warns his hearers against attaching intrinsic importance to it (Isa. lxvi. 1). To Haggai the temple appears so essential that he teaches that while it lay waste the people and all their works and offerings were unclean (Hag. ii. 14). In this he betrays his affinity with Ezekiel, who taught that it is by the possession of the sanctuary that Israel is sanctified (Ezek. xxxvii. 28). In truth the new movement of religious thought and feeling which started from the fall of the Hebrew state took two distinct lines, of which Ezekiel and the anonymous prophet of Isa. xl.-lxvi. are the respective representatives. While the latter developed his great picture of Israel the mediatorial nation, the systematic and priestly mind of Ezekiel had shaped a more material conception of the religious vocation of Israel in that picture of the new theocracy where the temple and its ritual occupy the largest place, with a sanctity which is set in express contrast to the older conception of the holiness of the city of Jerusalem (cf. Ezek. xliii. 7 seq. with Jer. xxxi. 40, Isa. iv. 5), and with a supreme significance for the religious life of the people which is expressed in the figure of the living waters issuing from under the threshold of the house (Ezek. xlvii.). It was the conception of Ezekiel which permanently influenced the citizens of the new Jerusalem, and took final shape in the institutions of Ezra. To this consummation, with its necessary accompaniment in the extinction of prophecy, the book of Haggai already points.

Exegetical Helps.—The elaborate and valuable German commentary of A. Kohler (Erlangen, 1860) forms the first part of his work on the *Nachexilische Propheten*. Reiske's *Commentary* (Münster, 1868) is the work of a Roman Catholic. Haggai has generally been treated in works on all the prophets, as by Ewald (2d ed., 1868; Eng. trans., vol. iii., 1878); or along with the other minor prophets, as by Hitzig (3d ed., Leipsic, 1863), Keil (1866; Eng. trans., Edinburgh, 1868), and Pusey (1875); or with the other post-exilic prophets as by Koehler, Pressel (Gotha, 1870), Dods (1879), and others. The older literature will be found in books of introduction or in Rosenmüller's still useful *Scholien*. The learned commentary of Marcius may be specially mentioned. On the place of Haggai in the history of Old Testament prophecy, see Duhm's *Theologie der Propheten* (Bonn, 1875). (W. R. S.)

HAGUE, THE (in Dutch, 's Gravenhage or den Haag; in French, *La Haye*; and in Modern Latin, *Haga Comitatus*), a town of the Netherlands, in the province of South Holland, 13 miles N.W. of Rotterdam, 10 miles S.W. of Leyden, and 2 miles inland from the German Ocean. It is con-

nected with both Rotterdam and Leyden by the "Holland Railway," and with Utrecht by the railway of the Rhine. Besides being the chief town of the province, the Hague is the usual residence of the court, and the seat of the Government, the states-general, the high council of the Netherlands, the council of state, the chamber of accounts, and various other administrative bodies. The characteristics of the town are quite in keeping with its political position. It is "the handsomest, the most fashionable, and the most modern-looking" town in the Netherlands. D'Amicis rightly describes it in his *Olanda* as half Dutch half French. Broad and regular streets, extensive avenues and drives, and spacious squares well planted with trees, are the main features of its general plan; large and beautiful buildings are numerous; and the population consists for the most part of Government officials and members of the nobility, the army, and the navy. A good idea

Plan of the Hague.

of the place is obtained by passing along the Vijverberg or Fishpond Hill, which takes its name from the large basin of water which it skirts, the Voorhout, and the Willemspark, next through Java Street and Sumatra Street, and then the Buitenhof or Outer Court, the Binnenhof or Inner Court, the Plein, the Kneuterdijk, and the Grootte Markt. Willemspark was laid out by King William II., and in 1869 it was chosen as the site of the national monument in memory of the recovery of independence in 1813, executed by Waaijen, Pietersen, and Koelman. The Plein, a square bordered with the offices of the various ministers and the high council, is adorned with a statue of William I., the "father of his people," by Louis Royer; an equestrian statue of the same prince, by the count of Nieuwerkerke, is placed in front of the royal palace; and there is a statue of William II. by Georges in the Buitenhof.

The centre of the Hague, both historically and topographically, is the buildings of the court. The oldest portion was founded by Count William II., "king of the Romans," in 1249. A handsome Gothic building, with towers at each corner of the façade, contains the great or knights' hall, a noble chamber 130 feet in length, 62 feet in breadth, and 69 in height, in which the states of the Netherlands abjured their allegiance to Philip II. of Spain, and in front of which the grey-headed Olden-Barneveldt lost his life in 1619. To the south-east of the hall is the troonzaal, or throne room, in which the second chamber of the states-general holds its sittings; and to the west is the meeting-place of the first chamber. The archives of the kingdom and several Government offices are in the same range of buildings. The royal palace proper was purchased by the states of the Netherlands in 1595, rebuilt by Prince William III., and extended by King William I. The palace of the prince of Orange was founded about 1720 by Count Unico William of Wassenaar Twiekels; the palace of Prince Frederick of the Netherlands dates from 1825 to 1828; the palace of Prince Henry was erected in 1743 for the deputies of Rotterdam; and the palace of Prince Alexander was in the 17th century the house of John de Witt, pensionary of the council. Among the public institutions of the Hague, the following are the most important:—the royal library, with upwards of 100,000 volumes, and a collection of manuscripts, coins, and gems, erected between 1734 and 1738; the Museum Meermanno-Westreelmanum, comprising books, manuscripts, maps, plates, pictures, antiquities, and curiosities; the royal picture gallery in the Prins-Mauritz-Huis, which was founded in 1633 by Prince John Maurice of Nassau-Siegen, governor of Brazil; the Vijverberg hôtel, with a collection of curiosities; the town museum of antiquities and modern art; the zoological gardens, founded in 1862; the royal school of design and music; and the new buildings for the arts and sciences, erected in 1874. Of the fourteen churches of the Hague five belong to the Dutch Reformed communion, six to the Roman Catholics, and one to the Old Catholics; one is Episcopalian, one German Evangelical, and two Apostolical. There are also two synagogues and one Greek chapel. Architecturally the Grootte Kerk, under the patronage of St James, is the most noteworthy; it is 300 feet long by 154 broad, and has a lofty tower and spire; in the interior are the sepulchral monuments of James Baron of Wassenaar Obdam, a Dutch naval hero, of Gerrit of Assendelft, and of Philip, landgrave of Hessen-Philipsthal. The Willemakerk was a present of William III. to the Reformed community of the Hague.

The principal industries of the town are iron-casting, copper and lead smelting, cannon-founding, the manufacture of furniture and carriages, silk-dyeing, liqueur-distilling, lithographing, and printing. In 1622 the population of the Hague was only 17,430; in 1732 it was estimated at 34,000; in 1796, inclusive of the inhabitants of Scheveningen,—a watering-place now connected with the town by a tramway line,—it was 41,266; in 1811, 42,150; in 1830, 56,105; in 1840, 58,521; and in 1850, 66,329. In 1860 it was 78,405; and in 1870, 91,328. At the last date 52,600 belonged to the Dutch Reformed Church; 27,486 were Roman Catholics, 3471 Dutch Jews, and 148 Portuguese Jews. In 1874 the total was stated at 94,895.

The Hague, mentioned as early as 1097 in a document by Count Floris II., seems originally to have been a shooting lodge of the counts of Holland. Under William II. it became a residence of the court; and in the 15th century it begins to be called a town, though for long after, down even to the time of Louis Napoleon, it was as frequently described as a village. In 1479 the soldiers of Maximilian of Austria put the place to ransom; in 1525 it was the scene of the martyrdom of Johannes Pistorius (Jan de Bakker of Woerd); in 1528 it was plundered by the people of Guelderland; and in 1572, 1573, and 1574 it was laid waste by the Spaniards. Restored by William

I. in 1576, it was in 1584 the seat of the sessions of the States of Holland. Fosses were constructed round the town in 1620. In 1672 it was the scene of the famous assassination of the brothers De Witt. It was at the Hague that the convention was arranged in 1710 between the German emperor, the king of Prussia, the emperor of Russia, and the maritime powers, for the maintenance of the neutrality of North Germany; it was at the Hague that the Triple Alliance of 1717 was concluded, and that the peace of the same year was signed between Spain, Savoy, and Austria. From 1782 to 1787 the town had its full share in the civil disturbances of the country. In 1808 it was made the seat of the Government administrative offices.

See *Guide ou Nouvelle Description de la Haye*, The Hague, 1785; *Description succincte de la ville de la Haye*, The Hague, 1823; *Morgen-wandelingen door en in den omtrek van 's Gravenhage*, The Hague, 1832; *Gezigten van 's Gravenhagen*, Amsterdam, 1845; *Petit Guide de la Haye*, The Hague, 1860; *La Haye et Scherwingue photographiës*, The Hague, 1860.

HAHN, AUGUST (1792-1863), German Protestant theologian, was born March 27, 1792, at Grossosterhausen near Eisleben, and after attending the Eisleben gymnasium, entered the university of Leipsic as a student of theology in 1810. After holding an educational appointment in Wittenberg for some time, he in 1819 was nominated professor extraordinarius of theology at Königsberg, and in the following year received a pastoral charge and a superintendency in that city. These posts, however, he soon resigned on his promotion in 1821 to be professor ordinarius. In 1826 he removed as professor of theology to Leipsic, where, hitherto distinguished only as editor of *Bardesanes*, *Marcion*, and *Ephraem Syrus*, he came into extraordinary prominence as the author of a treatise, *De rationalismi qui dicitur vera indole et qua cum naturalismo contineatur ratione* (1827), and also of an *Offene Erklärung an die Evangelische Kirche zunächst in Sachsen u. Preussen* (1827), in which he endeavoured to convince the rationalists that it was their duty voluntarily and at once to withdraw from the national church. In 1833 Hahn was called to Breslau as theological professor and consistorial councillor, and in 1844 he became "general superintendent" of the province of Silesia. He died at Breslau on May 13, 1863. Though uncompromising in his "supranaturalism," he did not altogether satisfy the men of his own school by his own doctrinal system. The first edition of his *Lehrbuch des christlichen Glaubens* (1828) was freely characterized as lacking in consistency and as detracting from the strength of the old positions in many important points. Many of these defects, however, he is considered to have remedied in his second edition (1857). Among the other literary labours by which Hahn is best known are his edition of the Hebrew Bible (1833) and his *Bibliothek der Symbole und Glaubensregeln der apostolisch-katholischen Kirche* (1842; 2d ed. 1877). A volume of *Predigten* was published in 1852.

HAHN, JOHANN GEORG VON (1810-1869), an Austrian traveller, to whom we are indebted for most of our knowledge about the Albanians, was born at Jena in 1810. After travelling for some time under the auspices of the Vienna academy, he entered the Austrian consular service, in which he rose to be consul-general in Greece. He died at Jena 23d September 1869. In his great work *Albanesischen Studien* (Jena, 1854), he treats at once of the geography, the history, the archaeology, the linguistic affinities, and the folk-lore of this remarkable country and people; and the book at once took rank as a scholarly and authoritative production. He had previously (1851) published *Bemerkungen über das Albanesische Alphabet* (Vienna, 1851). In 1858 he undertook a journey along with Major F. Zach from Belgrade to Saloniki (Thessalonica), for the purpose mainly of ascertaining the feasibility of constructing a railway from the Danube to the Ægean; and an account of their experiences was published in the *Denkschriften der Kaiserl. Akademie der Wissenschaften zu*

Wien, *Phil. Hist. Klasse*, Bd. xi., Vienna, 1861. This paper, reprinted in 1871, contained valuable matter in regard to the Albanians, and especially in regard to their geographical distribution. Another journey undertaken in 1863 furnished material for a second contribution to the *Denkschriften* (*Phil. Hist. Klasse*, 1867)—"Reise durch die Gebiete des Drin und Wardar." Since the author's death a large work has appeared under the title of *Sagwissenschaftliche Studien* (Jena, 1872-73), in which he deals learnedly with numerous questions in comparative mythology.

HAHNEMANN, SAMUEL CHRISTIAN FRIEDRICH (1755-1843), the founder of the homœopathic system of medicine, was born at Meissen in Saxony, 10th April 1755. He studied first at the "elector's school" of Meissen, and thereafter as a student of medicine at Leipsic and Vienna. He took the degree of M.D. at Erlangen in 1779, and after acting as physician at various places he returned in 1789 to Leipsic, where he largely occupied himself in the translation of medical works. While working at Cullen's *Materia Medica*, he was struck by the contradictory account given of the properties of Peruvian bark. He had previously meditated much on the unsatisfactory nature of the science of medicine; and, after much reflexion and many experiments, he became convinced of the truth of the principle *similia similibus curantur* (see HOMŒOPATHY), i.e., the cure for a disease is the very drug that would in a healthy person produce the symptoms of such disease. Further experiments convinced him that the conventional doses produced symptoms of unnecessary and dangerous violence, and this led to another principle, that of minimum doses, according to which the benefit to be derived from a medicine can be fully obtained by the administration of a very small quantity. Firmly convinced of the truth of these principles, Hahnemann spent the rest of his life in making them known to the world. He encountered much opposition, and in 1821 was forced to leave Leipsic, as he was not allowed to dispense his own prescriptions. The grand duke of Anhalt-Köthen, however, appointed him his physician, and at Köthen he resided till 1835 when he removed to Paris. He died 2d July 1843. Hahnemann was a man of remarkable courage and perseverance. He not only sacrificed his immediate interests for the sake of his convictions, but made many painful experiments upon his own person.

Hahnemann's chief work, in which he expounds his system, is his *Organon der rationellen Heilkunde* (Dresden, 1810; 6th ed., Köthen, 1865; English translation by Dodgeon, London, 1849). His other important writings are *Fragmenta de viribus medicamentorum positivis* (2 vols., Leipsic, 1805); *Reine Arzneimittellehre* (6 vols., Dresden, 1811); *Die chronischen Krankheiten* (4 vols., Dresden, 1828-30). His smaller writings have been edited by Stapf (2 vols., Dresden and Leipsic, 1829-34). See also Albrecht's *Hahnemann's Leben und Wirken* (2d ed., Leipsic, 1875).

HAIDARÁBÁD. See HYDERABAD.

HAIDINGER, WILHELM VON (1795-1871), a mineralogist, geologist, and physicist of considerable note, was born at Vienna, February 5, 1795. His father, Karl Haidinger, contributed largely to the development of mineralogical science in the latter half of the last century. Having studied at the normal school of St Anne, and attended classes at the university, Wilhelm, at the age of seventeen, joined Professor Mohs at Gratz, and five years later accompanied the professor to Freiberg on the transfer of his labours to the mining academy of that Saxon Eldorado. In 1822 Haidinger visited France and England with Count Breunner, and, journeying northward, took up his abode in Edinburgh. He translated into English, with additions of his own, Mohs's *Grundriss der Mineralogie*, published at Edinburgh in three volumes under the title *Treatise on Mineralogy*, 1825. After a tour in northern

Europe, including the Scandinavian mining districts, he undertook the scientific direction of the porcelain works at Elmhoven, belonging to his brothers. In 1840 he was appointed counsellor of mines (Bergath) at Vienna in the place of Professor Mohs, a post which included the charge of the imperial cabinet of minerals, &c. He devoted himself to the rearrangement and enrichment of the collections, and the cabinet became the first in Europe. Shortly after (1843) Haidinger commenced a series of lectures on mineralogy, which was given to the world under the title *Handbuch der bestimmenden Mineralogie* (Vienna, 1845; tables, 1846). On the establishment of the imperial geological institution, he was chosen director (1849); and this important position he occupied for seventeen years. On the completion of the geological survey of the Austrian dominions in 1862, he superintended the preparation of the maps which were issued. He was elected a member of the imperial board of agriculture and mines, and a member of the imperial academy of sciences of Vienna. He organized the society of the friends of natural sciences. As a physicist Haidinger ranked high, and he was one of the most active promoters of scientific progress in Austria. He was the discoverer of the interesting optical appearances which have been called after him, "Haidinger's brushes." Knighted in 1865, the following year he retired to his estate at Dornbach near Vienna, where he died March 19, 1871.

In addition to the works already named, Haidinger published *Anfangsgründe der Mineralogie*, Leipsic, 1829; *Bericht über die Mineralien-Sammlung der K.K. Hofkammer im Münz- und Bergwesen*, Vienna, 1843; *Geognostische Uebersichtskarte der Oesterreich. Monarchie*, Vienna, 1847; *Ueber den Zusammenhang der Körperfarben und der Oberflächenfarben*, Vienna, 1852; *Bemerkungen über die Anordnung der kleinsten Theilchen in Crystallen*, Vienna 1853; *Niedrigste Höhe von Geoterranolen*, Vienna, 1853; *Interferenzlinien am Glimmer*, Vienna, 1855; *Vergleichungen von Augit und Amphibol*, Vienna, 1855; *Die konische Refraction am Diopsid*, Vienna, 1855. He also edited the *Naturwissenschaftliche Abhandlungen*, Vienna, 1847; the *Berichte über die Mittheilungen von Freunden der Naturwissenschaften in Wien*, Vienna, 1847-51; and the *Jahrbuch der Vienna K.K. Geologische Reichsanstalt*, 1850, &c. Some of his papers will be found in the *Transactions of the Royal Society of Edinburgh* (vol. x.) and of the *Wernerian Society* (1822-23), *Edinburgh Phil. Journal*, *Brewster's Journal of Science*, and *Poggendorff's Annalen*.

HAIL. See METEOROLOGY.

HAILES, SIR DAVID DALRYMPLE, BART., LORD (1726-1792), an eminent Scottish lawyer and historian, was born at Edinburgh, October 28, 1726. His father, Sir James Dalrymple of Hailes, in the county of Haddington, Bart., auditor-general of the exchequer in Scotland, was a grandson of James, first Viscount Stair; and his mother, Lady Christian Hamilton, was a daughter of Thomas, sixth earl of Haddington. He received his school education at Eton, and thence proceeded to Utrecht for the study of law, being intended for the Scottish bar, to which he was admitted, shortly after his return to his native country, on the 24th of February 1748. As a pleader he attained neither high distinction nor very extensive practice, but he rapidly established a well-deserved reputation for sound knowledge, unwearied application, and strict probity; and in 1766 he was elevated to the bench, when he assumed the title of Lord Hailes. Ten years later he was appointed a lord of judicatory. His death took place on the 29th of November 1792.

His most important contribution to literature is the *Annals of Scotland*, of which the first volume, "From the accession of Malcolm III., aurnamed Canmore, to the accession of Robert I.," appeared in 1776, and the second, "From the accession of Robert I., surnamed Bruce, to the accession of the House of Stewart," in 1779. It is, as Dr Johnson justly described this work at the time of its appearance, a "Dictionary" of carefully sifted facts, in our language a new mode of history which tells all that is wanted and all that is known, but without any laboured splendour of language or affected subtlety of conjecture. The other works of Lord Hailes

include *Historical Memoirs concerning the Provincial Councils of the Scottish Clergy* (1769); *An Examination of some of the arguments for the High Antiquity of Regiam Majestatem* (1769); three volumes entitled *Remains of Christian Antiquity* ("Account of the Martyrs of Smyrna and Lyons in the second century," 1776; "The Trials of Justin Martyr, Cyprian, &c.," 1778; "The History of the Martyrs of Palestine, translated from Eusebius," 1780); *Disquisitions concerning the Antiquities of the Christian Church* (1783); and editions or translations of portions of Lactantius, Tertullian, and Minucius Felix. In 1785 he published *An Inquiry into the Secondary Causes which Mr Gibbon has assigned for the Rapid Growth of Christianity*; a Dutch translation of which was published at Utrecht in 1793. Both by its acuteness in detailed argument and by its freedom from theological rancour this controversial work is entitled to rank as one of the most respectable of the very many replies which were made to the famous 15th and 16th chapters of the *Decline and Fall of the Roman Empire*; but it has too much the character of a collection of detached critical remarks. A "Memoir" of Lord Hailes is prefixed to the 1808 reprint of his *Inquiry into the Secondary Causes*.

HAINAN, or, as it is usually called in Chinese, *Kiung-chow-foo*, an island belonging to the Chinese province of Kwang-tung, and situated between the Chinese Sea and the Gulf of Tong-king from 20° 8' to 17° 52' N. lat., and from 108° 32' to 111° 15' E. long. It measures 160 miles from N.E. to S.W., and the average breadth is about 90 miles. The area is estimated at from 1200 to 1400 square miles, or two-thirds the size of Sicily. From the peninsula of Lei-chow on the north it is separated by the straits of Hainan, which have a breadth of 15 or 20 miles.

With the exception of a considerable area in the north, and broad tracts on the north-east and north-west sides, the whole island is occupied by jungle-covered mountains, with rich valleys between. The central range bears the name of Li-mou Shan or Wu Tchi Shan (the Five-Finger Mountain), and attains a height of 6000 or 7000 feet. Its praises are celebrated in a glowing ode by Ch'iu, a native poet. The island appears to be well watered, and some of its rivers are not without importance as possible highways of commerce; but the details of its hydrography are very partially ascertained. A navigable channel extends in an irregular curve from the bay of Hai-Kow in the north to Tan-chow on the west coast. Being exposed to the winter monsoon the northern parts of the island enjoy much the same sort of temperate climate as the neighbouring provinces of the mainland, but in the southern parts, protected from the monsoon by the mountain ranges, the climate is almost or entirely tropical. Snow falls so rarely that its appearance in 1684 is reported in the native chronicles as a remarkable event. Earthquakes are a much more familiar phenomenon, having occurred, according to the same authority, in 1523, 1526, 1605, 1652, 1677, 1681, 1684, 1702, 1704, 1725, 1742, 1816, 1817, and 1822. Excellent timber of various kinds—eagle-wood, rose-wood, liquidambar, &c.—is one of the principal products of the island, and has even been specially transported to Peking for imperial purposes. The cocoa palm flourishes freely even in the north, and is to be found growing in clumps with the *Pinus sinensis*. Rice, cotton, sugar, indigo, cinnamon, betel-nuts, sweet potatoes, ground-nuts, and tobacco are all cultivated in varying quantities. The aboriginal inhabitants collect a kind of tea called tein-cha, or celestial tea, which looks like the leaves of a wild camellia, and has an earthy taste when infused. Lead, silver, copper, and iron occur in the Shih-luh Shan or "stone-green-hill"; the silver at least was worked till 1850, and the copper would probably pay for its exploitation. Gold and lapis lazuli are found in other parts of the island.

The ordinary cattle of Hainan are apparently a cross between the little yellow cow of South China and the zebu of India. Buffalos are common, and in the neighbourhood of Nanleu at least they are frequently albinos. Horses are numerous but small. Hogs and deer are both common wild animals, and of the latter there are three species.

Cervus Eluli, *Cervus hippelaphus*, and *Cervus vaginalis*. Among the birds, of which 172 species are described by Mr Swinhoe in his paper in *The Ibis*, 1870, there are eagles, notably a new species *Spilornis Rutherfordi*, buzzards, harriers, kites, owls, goatsuckers, and woodpeckers. The *Upupa ceylonensis* is familiar to the natives as the "bird of the Li matrons," and the *Palaornis javanica* as the "sugar-cane bird."

Hainan, as already indicated, forms a foo or department of the province of Kwang-tung, though strictly it is only a portion of the island that is under Chinese administration, the remainder being still occupied by unsubjugated aborigines. The department contains three chow and ten hsien districts,—Kiung-chow-hsien, in which the capital is situated; Ting-an-hsien, the only inland district; Wen-ch'ang-hsien, in the north-east of the island; Hui-tung-hsien, Lo'-hui-hsien, Ling-shui-hsien, Wan-chow, Ai-chou (the southmost of all), Kan-en-hsien, Chang-hua-hsien, Tan-chow, Lin-kaohsien, and Chang-mui-hsien. The capital Kiung-chow-foo is situated in the north about 10 li (or 3 miles) from the coast on the river. It is a well-built compact city, and its temples and examination halls are in good preservation. The population is frequently stated at 200,000, but, according to C. C. Stuhlmann in the *Globus* for 1876, it is only 100,000. Carved articles in cocoa-nuts and scented woods are its principal industrial product. In 1630 it was made the seat of a Roman Catholic mission by Benoit de Mathos a Portuguese Jesuit, and the old cemetery still contains about 113 Christian graves. The port of Kiung-chow-foo at the mouth of the river, which is nearly dry at low water, is called simply Hoi-how, or in the court dialect Hai-Kow, *i.e.*, seaport. The two towns are united by a good road, along which a large traffic is maintained partly by coolie porters but more frequently by means of wheelbarrows, which serve the purpose of cabs and carts. The net value of the trade of the port, that is, the foreign and native imports minus the re-exports and the native imports of local origin, rose from 684,772 Hk. taels in 1876 to 1,215,056 in 1878. Out of 182 vessels engaged in the foreign trade in 1878 with a tonnage of 87,290 tons, 152 were British, with a tonnage of 70,078 tons. The exports comprised leather, hides, skins and tallow, sugar to the value of 204,427 taels, hemp, galangal, lung-ngan pulp, grass cloth, and silk, and sesamum to the value of 41,936 taels.

The inhabitants of Hainan may be divided into three classes, the Chinese immigrants, the civilized aborigines or Shu-li, and the wild aborigines or Sheng-li. The Chinese were for the most part originally from Keang-se and the neighbouring provinces, and they speak a peculiar dialect of which a detailed account by Mr Swinhoe is given in *The Phoenix, a Monthly Magazine for China, &c.*, 1870. The Shu-li as described by Mr Taintor are almost of the same stature as the Chinese, but have a more decided copper colour, higher cheek-bones, and more angular features, while their eyes are not oblique. Their hair is long, straight, and black, and their beards, if they have any, are very scanty. They till the soil and bring rice, fuel, timber, grass-cloth, &c., to the Chinese markets. The Sheng-li or Li proper, called also La, Le, or Lauy, are probably connected with the Laos of Siam, and the Lolos of China. Though not gratuitously aggressive, they are highly intractable, and have given great trouble to the Chinese authorities. Among themselves they carry on deadly feuds, and revenge is a duty and an inheritance. Though they are mainly dependent on the chase for food, their weapons are still the spear and the bow, the latter being made of wood and strung with bamboo. In marriage to avoidance of similarity of name is required. The bride's face is tattooed according to a pattern furnished by the bridegroom. Their funeral mourning consists of abstaining from drink and eating raw beef, and they use a

wooden log for a coffin. When sick they sacrifice oxen. In the spring time there is a festival in which the men and women from neighbouring settlements move about in gay clothing hand in hand and singing songs. The whole population of the island is estimated at about 2½ millions. At its first conquest 23,000 families were introduced from the mainland. In 1300 the Chinese authorities assign 166,257 inhabitants; in 1370, 291,000; and in 1617, 250,524; and in 1835, 1,350,000.

It was in 111 B.C. that Lu-Po-Teh, general of the emperor Wu-ti, first made the island of Hainan subject to the Chinese, who divided it into the two prefectures, Tan-urh or Drooping Ear in the south, so-called from the long ears of the native "king," and Chu-yai or Pearl Shore in the north. During the decadence of the elder branch of the Han dynasty the Chinese supremacy was weakened, but in 43 A.D. the natives were led by the success of Ma-yuan in Tong-king to make a new tender of their allegiance. About this time the whole island took the name of Chu-yai. In 627 A.D. the name of Kiung-chow came into use. On its conquest by the generals of Kublai Khan in 1278 the island was incorporated with the western part of the province of Kwang-tung in a new satrapy Hai-peh Hai-nan Tao, *i.e.*, the circuit north of the sea and south of the sea. It was thus that Hai-nan-Tao, or district south of the sea or strait, came into use as the name of the island, which, however, has borne the official title of Kiung-chow-foo, probably derived from the Kiung-shan or Jade Mountains, ever since 1370, the date of its erection into a department of Kwang-tung. For a long time Hainan was the refuge of the turbulent classes of China and the place of deportation for delinquent officials. It was there, for example, that Su-She or Su-Tung-po was banished in 1097. From the 15th to the 19th century pirates made the intercourse with the mainland dangerous, and in the 17th they were considered so formidable that merchants were allowed to convey their goods across only by the narrow channel from Sen-wen. Since 1863 the presence of English men-of-war has put an end to this evil. According to the treaty of Tientsin, the capital Kiung-chow and the harbour Hai-Kow were opened to European commerce; but it was not till 1876 that advantage was taken of the permission.

See Taintor in *Notes and Queries on China and Japan*, 1868; Mayers, "Hist. and Stat. Sketch of the Island of Hainan," in *Journal of N. China Branch of Roy. As. Soc.*, new ser., No. vii. (1871-2); Dr F. Hirth, "Die Chinesische Provinz Kwang-tung," in Petermann's *Mittheilungen*, 1873; *The China Review*, Hong-Kong, 1876; *Report on the newly-opened ports of Kiung-chow (Hoi-how) in Hainan, and of Hui-phong in Tongkin*, by N. B. Denny's, Hong-Kong, 1876. (H. A. W.)

HAINAU (officially HAYNAU), a town in the Prussian province of Silesia, circle of Goldberg-Hainau and government district of Liegnitz, is situated on the Rapid Deichsel and on the railway from Breslau to Dresden, 12 miles N.W. of Liegnitz. It has an Evangelical and a Roman Catholic church, and manufactories of woollen and cotton cloth, gloves, leather, locks, and tin ware. Near Hainau the Prussian cavalry inflicted a defeat on the French rear-guard, 26th May 1813. The population of the town in 1875 was 5351.

HAINAULT, one of the nine provinces of the kingdom of Belgium, bounded E. and N. by Namur, Brabant, and Flanders, which are also Belgian provinces, and to the S. and W. by the French département du Nord. The name is doubtless derived from the little river Haine, which runs nearly due east and west past the town of Mons, and falls into the Scheldt not far from Condé. Hainault is well-wooded and hilly in the east and south-east, where it is partly covered by the Ardennes; the rest of the province is a pleasantly diversified, fertile, and well-cultivated plain-land, which produces all kinds of cereal crops, flax, tobacco, chicory, and beetroot. The long and narrow coal-field which, with some breaks, stretches from Aix-la-Chapelle to the sea near Boulogne, passes through the middle of Hainault, underlying a district of about 190,000 acres; its centre is about Mons, whence it extends westward to Valenciennes, eastward to Charleroi. At this latter town, named after Charles II. of Spain, who built it in 1666, are iron and copper works; marble and building-stone are also largely quarried in Hainault; and the manufactures of the province are vigorous and good; ironware and cutlery,

¹ In German, *Hennegou*; Flemish, *Heenvouwen*; French, *Hainaut*; the *Comitatus Hennegensis* or *Hannonia* of Latin chroniclers.

woollen and linen goods, glass, porcelain, and a variety of other articles are made, and are exported largely into France. Hainault, with a population of 956,354 inhabitants in 1876 (the largest in this respect of all the provinces), has an area of near 1400 square miles, and is therefore somewhat thickly peopled; for administrative purposes it is divided into six *arrondissements*, of which that of Mons is the chief; the others are Tournai, Charleroi, Ath, Soignies, and Thuin; these again are subdivided into thirty-two cantons.

Formerly the county was nearly twice as large as the present province. In Caesar's days it was inhabited by the Nervii, and did not get its present name till the 7th century, before which time it had become a county under its own lords. This dignity, at first more or less elective, became hereditary in the 9th century. Throughout the early Middle Ages Hainault was a purely agricultural district, owned by a numerous and very quarrelsome and disagreeable nobility; it possessed also no less than fifteen abbeys. It was famous in legend and history as the chosen land of chivalry, and Froissart, himself a native of Valenciennes, faithfully reflects the character of his fatherland. In the 11th century Baldwin V. of Flanders occupied it, and Baldwin VI., by marrying the heiress to the county, permanently added it to the territories of his house. It was his descendant Baldwin IX., count of Flanders and Hainault, who proclaimed himself first Latin emperor of Constantinople in 1204. In 1300 John of Avennes, count of Hainault, became also count of Holland by right of his mother Adelaide, sister of William II. of Holland; it was his granddaughter Philippa who in 1328 married the Prince of Wales, afterwards Edward III. Hainault went with Flanders, till it was occupied by Philip "the Good" of Burgundy in the war which lasted from 1424 to 1427. It finally fell to the house of Burgundy on the death of the unfortunate Jacoba in 1436. With the other territories of Charles the Bold it passed with Mary of Burgundy in 1477 to the house of Austria, and remained theirs till the peace of the Pyrenees in 1659, when part of the southern portion of the county was ceded to Louis XIV.—a cession confirmed and enlarged at Nimwegen in 1678. Thenceforth there are two Hainaults, the French and the Austrian, the latter answering to the present Belgian province. French Hainault (now a part of the department du Nord) had as its ancient capital Valenciennes; its other towns are Condé, Cambrai, Maubeuge, Le Quesnoy, Landrécies, Avesnes, Givet, Charlemont. Philippeville, which owes its name to Philip II. of Spain, having been transmuted out of a village called Corbigny into a town by Charles V. in 1555, was restored to the Netherlands in 1815. Austrian Hainault was overrun by the French in 1793, and annexed to France as the department of Jemmapes in 1794; in 1814 it was made part of the kingdom of the Netherlands; and in 1830, as a matter of course, in the division of that kingdom, it became one of the provinces of the Belgian half.

The chief authorities are the Baron de Reiffenberg's *Monuments pour servir à l'histoire des Provinces de Namur, de Hainault, et de Luxembourg, 1844-1848*, and Jacques de Guise's *Antiquités du pays de Haynault*.

HAINBURG, or HAIMBURG, a town of Austria, in the circle of Bruck, situated on the Danube 27 miles E.S.E. of Vienna, is the seat of a district court of justice and of a tax-office. It occupies part of the site of the old Celtic town Carnuntum, destroyed 251 A.D. Since the fire of 1827 Hainburg has been much improved, and is now a handsomely built town. It is still surrounded by ancient walls, and has a gate guarded by two old towers. There are numerous Roman remains, among which may be mentioned the altar and tower at the town-house, on the latter of which is a statue, said to be of Attila. A Roman aqueduct is still used to bring water to the town. Hainburg has a military school for engineers. The two important manufactures are tobacco, employing about 1700 hands, and needles, of which about 80 millions are annually turned out. On the neighbouring Hainberg is an old castle, built of Roman remains, which appears in German tradition under the name of Heimburg; it was wrested from the Hungarians in 1042 by the emperor Henry III. At the foot of the same hill is a castle of the 12th century, where Ottocar, of Bohemia, was married to Margaret of Austria in 1252; earlier it was the residence of the dukes of Babenberg. Outside the town, on an island in the Danube, is the ruined castle of Röthelstein or Rothenstein, held by the Knights

Templars. Hainburg was besieged by the Hungarians in 1477, was captured by Matthias Corvius in 1482, and was sacked, and its inhabitants massacred, by the Turks in 1683. Population (1869), 4178.

HAINICHEN, a town of Saxony, in the circle of Leipsic and the prefecture of Döbeln, is situated on the Little Striegis, 15 miles N.E. of Chemnitz by railway. It is the seat of a royal court of justice, and has cigar and leather manufactories and a school of weaving. Its most important industry is the manufacture of flannels, baize, and similar fabrics; indeed it may be called the centre of this industry in Germany. The special whiteness and excellence of the flannel made in Hainichen is due to the peculiar nature of the water used in the manufacture. There are 22 spinning-mills in the town and environs, with about 2500 looms, of which between 300 and 400 are mechanical. There are also large dye-works and bleaching establishments. Large quantities of both wool and cotton are spun and woven, and yarn spun elsewhere is brought to Hainichen to be woven. About 3,850,000 lb of raw wool, worth about £600,000, is annually worked into material, some of which is exported to South America and eastern Asia. Coal is found in the neighbourhood, but does not repay the expense of working. Hainichen is the birthplace of Gellert, to whose memory a bronze statue was erected in the market-place in 1865. The Gellert institution for the poor was erected in 1815. Population (1875), 8468.

HAIR is a substance which, from its various properties, and differences in stoutness, length, and strength, enters into a considerable variety of manufactures. Bristles are the stout elastic hairs obtained from the backs of certain breeds of pigs. The finest qualities, and the greatest quantities as well, are obtained from Russia, where a variety of pig is reared principally on account of its bristles. The best and most costly bristles are used by shoemakers, secondary qualities being employed for toilet and clothes-brushes, while inferior qualities are worked up into the commoner kinds of brushes used by painters and for many mechanical purposes. For artists' use and for decorative painting, brushes or pencils of hair from the sable, camel, badger, polecat, &c., are prepared. The hair of various animals which is too short for spinning into yarn is utilized for the manufacture of felt. For this use the hair of rabbits, hares, beavers, and of several other rodents is largely employed, especially in France, in making the finer qualities of felt hats. Cow hair, obtained from tanneries, is used in the preparation of roofing felts, and felt for covering boilers or steam-pipes, and for other similar purposes. It is also largely used by plasterers for bidding the mortar of the walls and roofs of houses; and of late years it has to some extent been woven up into coarse friezes, horse-cloths, railway rugs, and inferior blankets. The tail hair of oxen is also of value for stuffing cushions and other upholstery work, for which purpose, as well as for making the official wigs of law officers, barristers, &c., the tail and body hair of the yak or Thibet ox is also sometimes imported into Europe. The tail and mane hair of horses is in great demand for various purposes. The long tail hair is especially valuable for weaving into hair-cloth, mane hair and the short tail hair being, on the other hand, principally prepared and curled for stuffing the chairs, sofas, and couches which are covered with the cloth manufactured from the long hair. The horse hair used in Great Britain is principally obtained from South America, Germany, and Russia, and its sorting, cleaning, and working up into the various manufactures dependent on the material are industries of some importance. In addition to the purposes already alluded to, horse hair is woven into crinoline for ladies' bonnets, plaited into fishing lines, woven into bags for oil and cider pressers, and into straining cloths for

brewers, &c., and for numerous other minor uses. The manufactures which arise in connexion with human hair are more peculiar than important, although occasionally fashions arise which cause a large demand for human hair. The fluctuations of such fashions determine the value of hair; but at all times long tresses are of considerable value. Grey, light, pale, and auburn hair are distinguished as extra colours, and command much higher prices than the common shades. The value of hair also increases very rapidly with increase in length. Thus while 8-inch hair sells at about 1s. per oz., 36-inch hair will command a price as high as 30s. per oz. Lengths beyond 36 inches are exceptional and command fancy prices, the standard length in the hair trade being 18 inches. The light-coloured hair is chiefly obtained in Germany and Austria, and the south of France is the principal source of the darker shades. In the south of France the cultivation and sale of beads of hair by peasant girls is a common practice; and hawkers attend fairs for the special purpose of engaging in this traffic. Hair 5 and even 6 feet long is sometimes obtained. Scarcely any of the "raw material" is obtained in the United Kingdom except in the form of ladies' "combing." Bleaching of hair by means of peroxide of hydrogen is now extensively practised, with the view of obtaining a supply of golden locks, or of preparing white hair for mixing to match grey shades; but in neither case is the result very successful. Human hair is worked up into a great variety of wigs, scalps, artificial fronts, frizzets, and curls, all for supplementing the scanty or failing resources of nature. The plaiting of human hair into articles of jewellery, watch guards, &c., forms a distinct branch of trade. For structure, properties, &c., of the human hair see ANATOMY, vol. i. p. 898.

HAIRBELL. See HAREBELL.

HAIR-TAIL (*Trichiurus lepturus*), a marine fish, with a long band-like body terminating in a thread-like tail, and with strong prominent teeth in both jaws. Several species are known, of which one, common in the tropical Atlantic, not rarely reaches the British Islands.

HAITI. See HAYTI.

HAJDÚK, sometimes corrupted into HEYDUKE, is the plural form of the Magyar word Hajdú, and was formerly used as the collective name of the undermentioned towns (along with Vámos-Pécs, population 3000) of the old privileged Hajdúk district of Hungary, now included in the county of Hajdú.

HAJDÚ BÖSZÖRMÉNY, the second town in importance of Hajdú county, lies about 11 miles to the N.W. of Debreczin, 47° 41' N. lat., 21° 31' E. long. It is the seat of a royal court of law, and was formerly the capital of the Hajdúk district. Among the principal buildings are the old district court-house, a Greek Catholic and two Calvinist churches, a Protestant gymnasium, the post and telegraph offices, and the savings bank. The fairs periodically held in the town attract people from a considerable distance. Population (1870) 19,208.

HAJDÚ-DOROG is a market-town situated about 10 miles to the N. of Bözörmény, with a Greek Catholic and a Calvinist church. At Dorog the Magyar adherents of the Greek Catholic Church are met with in great numbers. Population 8216.

HAJDÚ-HADNÁZ is a corporate town lying about 10 miles N. of Debreczin. It has a Calvinist church, post and telegraph offices, and a station on the railway from Nyiregyháza to Debreczin. Population 7024.

HAJDÚ-NÁNÁS is a market-town, about 24 miles N.N.W. of Debreczin, with a large Calvinist church, a high school for girls, and a Protestant gymnasium. The surrounding country, although on the whole productive, assumes in the west a generally swampy character. Population 13,193.

HAJDÚ-SZOBOSZLO is a corporate town, 12 miles to the S.W. of Debreczin, with which it is connected by railway. Among the principal buildings are a Calvinist church and school, and a royal law-court. Population 12,269.

The Hajdúk district was made over to the Hajdúks in 1605, with special privileges and the rights of nobility, by the Transylvanian prince Stephen Bocskay, as a reward for military service rendered him in his revolutionary campaign. The inhabitants were confirmed in their possessions by the diet of 1613. From 1849 to 1860 the district was united to the county of North Bihar, but it afterwards received a separate cantonal organization. It now forms the principal portion of the new county of Hajdú, constituted in 1876, and including, along with the old Hajdúk district, portions of the neighbouring counties of Szabolcs and Bihar. Debreczin is the capital, and the population is computed at about 163,000, mostly Magyar.

HÁJÍPUR, a municipal town in Muzaffarpur district, Bengal, situated on the east bank of the Gandak, a short distance above its confluence with the Ganges opposite Patná, 25° 40' 50" N. lat., 85° 14' 24" E. long. It is said to have been founded about 500 years ago by one Hájí Ilyás, the supposed ramparts of whose fort, enclosing an area of 360 *bighás*, are still visible. Hájípur figures conspicuously in the history of the struggles between Akbar and his rebellious Afghan governors of Bengal, being twice besieged and captured by the imperial troops, in 1572 and again in 1574. Its command of water traffic in three directions makes the town a place of considerable commercial importance. Within the limits of the old fort is a small stone mosque, very plain, but of peculiar architecture, and attributed to Hájí Ilyás. Two other mosques and a small Hindu and Buddhist temple are in the town or its immediate vicinity. Besides the ordinary courts, the town contains a school, post-office, charitable dispensary, and distillery. The population in 1872 numbered 22,306, of whom 18,765 were Hindus and 3510 Mahometans.

HAIJJI KHALFA. Mustafa 'bn Abdallah, Kátib Chelepi (c. 1600-1658), commonly known as Haji (or Hadji) Khalfa (more properly Hájí Khalífah), was the author of an encyclopædia in Arabic of Oriental biography and bibliography. He was born at Constantinople about the beginning of the 17th century of the Christian era, and after passing the earlier part of his life in military service, studied under Cadhizádeh Effendi, a learned doctor at the Ottoman capital, and made great progress in Arabic literary and linguistic studies. In June 1633 he again accompanied the army to Syria, but while the troops were in winter quarters at Aleppo, he himself performed the pilgrimage to Mecca, whence he took the cognomen of Hájí, "Pilgrim." Returning in 1635 to Constantinople, he resumed his literary studies, and occupied himself with visiting all the libraries and book shops, and compiling an inventory of their contents, together with notices of the authors of the various works. In 1638 he attended the lectures of Sheikh A'raj Mustafazadah, whom he proposed to himself as an example to imitate in his future literary career. Besides his purely literary studies he also devoted himself assiduously to the sciences, and became well versed in logic, geometry, geography, astronomy, and the like. Nor were medicine and the occult sciences neglected by him, so that there were few of the subjects treated of in the works which he delighted to describe with which he was not more or less technically acquainted. About 1648, he was appointed assessor (khalifa) to the principal of the imperial college, whence he took the title of Khalfa, by which, with the prefix of Hájí (Pilgrim), he is commonly designated. He died in September 1658.

Besides his great *Bibliographical Lexicon*, he composed several other works, chiefly geographical and historical; of these the best known are *Takwimu 't-tawarikh* or "Chronological Tables," *Tuhfat el Khabar ft asfiri Bahár*, a work on the science of naval warfare, *Jeldi Numá* or "Mirror of the World," and one or two treatises on miscellaneous literary subjects. The language in which he wrote is Arabic, and the style is that which the nature of his studies would

lead us to expect,—correct and grammatical, fairly classical, and abounding in technical terms and phraseology. Of the amount of his learning and of his indefatigable application to study his *Lexicon* is a lasting memorial. There is scarcely a work in the whole range of Arabic, Persian, and Turkish literature, no matter on what subject or science, but it will be found described in this vast encyclopædia, with every piece of collateral information which it was possible to procure or useful to mention. When we remember that it is the Oriental habit to give fancy titles to books that often in no way indicate the nature of their contents, and that one is often obliged to read through pages of irrelevant matter before arriving either at the author's name or the subject of the work, the labour expended on the production of Hajji Khalfa's book appears absolutely incredible. The work has always enjoyed a well-deserved reputation in the East, and has attracted the attention of many European scholars, but we need only mention here the magnificent edition in seven thick 8vo volumes by the eminent Arabic scholar Gustavus Fluegel published at Leipsic in 1835-1855 for the Oriental Translation Fund of Great Britain and Ireland. This edition is accompanied by a Latin page-for-page translation, indices, and notes, and is an indispensable adjunct to every library in which a collection of Oriental books is found. The Arabic title of the lexicon is *Kashfu zu'un 'an Asimi'l Kutub wa'l funun*, "The removal of doubts concerning the names of books and concerning sciences," and the Latin title adopted by Fluegel is *Lexicon Bibliographicum et Encyclopedicum Haji Khalifee*. After a short preface and an introduction of five chapters comes the encyclopædia proper, the articles in which are arranged in the alphabetical order of the names of the works described. The title of each work is given, a concise account of its contents, the name of the author, and the date, when this could be ascertained; and in many cases the initial phrase is also added to facilitate its identification. Besides the general bibliography, Fluegel's edition contains several appendices of great value to Oriental scholars and librarians. Copious notes and indices complete this splendid edition, one of the finest monuments of Oriental learning which Europe has produced.

HAKÉ (*Merluccius vulgaris*), a fish belonging to the family of cod-fishes (*Gadidae*), differing from the common cod in having only two dorsal and one anal fin. It is very common on the coasts of Europe and eastern North America, but its flesh is much less esteemed than that of the true *Gadi*. Specimens 4 feet in length are not scarce. A closely allied fish inhabits the coasts of Chili and New Zealand.

HAKIM, or, as the full title runs, **EL HAKIM BR-AMRILLAH ABOO 'ALEE MANSOOR** (985-1020), the sixth of the Fatimid caliphs, and the third of that dynasty ruling in Egypt, founder of the sect of the Druses, was born in 985 A.D., was designated heir apparent in 993, succeeded in 996, and died in 1020. For the principal events of his life and the leading features of his character the reader is referred to the article **EGYPT** (vol. vii. p. 751). See also **DRUSES** (vol. vii. p. 484).

HAKLUYT, RICHARD (c. 1553-1616), geographer, was born of good family¹ in or near London about 1553. He was elected "one of her Maiesties scholars at Westminster," and it was while there that the bent of his future studies was determined by a visit to his cousin and namesake, Richard Hakluyt of the Middle Temple. His cousin's discourse, illustrated by "certain bookes of cosmographie, an universall mappe, and the Bible," had such an effect upon Hakluyt's mind that he resolved, if opportunity offered, to "prosecute that knowledge and kind of literature." Entering Christ Church, Oxford, in 1570, "his exercises of duty first performed," he fell to his intended course of reading, and by degrees perused all the printed or written voyages and discoveries that he could find. He took his degree of B.A. in 1573-74, and we learn from the Towneley MSS. that two years later he was selected twice in the same year to receive gifts of money.² It is highly probable that,

¹ The Hakluyts were a family of Welsh extraction, not Dutch as has been supposed. They appear to have settled in Herefordshire as early as the 13th century. The family seat was at Eaton, 2 miles S. E. of Leominster. Hugo Hakelute was returned M. P. for that borough in the 32d parliament of Edward I. 1304-5. See *Return of Members of Parliament*, pt. i. p. 18.

² "To one Mr Hakelute, B.A. of Christ Colledge in Oxford, the 12 of May (1575), by Dr Humfrey (professor of divinity), 10s. To one Mr Hakeluit, the 4th of June, 2s. 6d." (Hist. MSS. Comm. 4th Report, Appendix, p. 614).

shortly after taking his degree of M.A. (1577), he commenced at Oxford the first public lectures in geography that "shewed both the old imperfectly composed and the new lately reformed mappes, globes, spheares, and other instruments of this art."³

Hakluyt's first published work was his *Divers Voyages touching the Discoverie of America* (London, 1582, 4to). By reason of his great knowledge of these matters and his acquaintance with "the chiefest captaines at sea, the greatest merchants, and the best mariners of our nation," he was selected in 1583, at the age of thirty, to accompany Sir Edward Stafford, the English ambassador, to Paris in the capacity of chaplain. In accordance with the instructions of Secretary Walsingham, he occupied himself chiefly in collecting information of the Spanish and French movements, and "making diligent inquirie of such things as might yield any light unto our westerne discoverie in America." The first fruits of Hakluyt's labours in Paris are embodied in the most important production of his that has seen the light in modern times; it is entitled *A particuler discourse concerning Westerne discoveries written in the yere 1584, by Richarde Hackluyt of Oxforde, from the requeste and direction of the righte worshipfull Mr Walter Raghly before the comynge home of his twoo barkes.*⁴ This long-lost MS., after failing to find a resting-place in America, was finally acquired by Sir Thomas Phillipps, and is now the property of Rev. J. E. A. Fenwick of Thirstane House, Cheltenham. The object of the *Discourse* was to recommend the enterprise of planting the English race in the unsettled parts of North America. Hakluyt's other works consist mainly of translations and compilations, relieved by his dedications and prefaces, which last, with a few letters, are the only material we possess out of which a biography of him can be framed.

Hakluyt returned to England in 1584, and during his short stay he had the honour of laying before Queen Elizabeth a copy of the *Discourse* "along with one in Latin upon Aristotle's *Politicks*," which won for him, two days before his departure again for Paris, the grant of the next vacant prebend at Bristol. In the spring of the following year, feeling anxious about the reversion of the prebend, he again visited England, and exhibited in person, on the 24th May 1585, before the chapter of Bristol cathedral, the queen's mandate for the coveted vacancy already signed and sealed. Before the close of the year the reversion of it fell to him, and in 1586 he was admitted to the prebend, which he held, with his other preferments, till the time of his death.

While in Paris Hakluyt caused to be published the MS. journal of Laudonnière or *Histoire notable de la Florida*, edited by M. Bassanier (Paris, 1586, 8vo). This was translated by Hakluyt and published in London under the title of *A notable historie containing foure voyages made by certayne French Captaynes into Florida* (London, 1587, 4to). The same year *De Orbe Novo Petri Martyris Anglerii Decades octo illustrata, labore et industria Richardi Hackluyti*, saw the light at Paris. This work contains the exceedingly rare copperplate map dedicated to Hakluyt and signed F. G. (supposed to be Francis Gualle); it is the first on which the name of "Virginia" appears.

In 1588 Hakluyt finally returned to England with Lady Stafford, after a residence in France of nearly five years. In 1589 he published *The Principall Navigations, Voiages, and Discoveries of the English Nation* (fol., London, 1 vol.). In the preface to this we have the announcement of the intended publication of the first terrestrial globe made in

³ That this was not in London is certain, as we know that the first lecture of the kind was delivered in the metropolis on the 4th of November 1588 by Thomas Hood.

⁴ Now first printed from a contemporary MS., with an introduction by Leonard Woods, LL.D., edited by Charles Deane, *Collection—Maine Hist. Soc., Camb. (Mass.), 1877, 8vo*

England by Molyneux (see *GLOBE*). On the 20th April 1590 he was instituted to the rectory of Witheringsett-cum-Breckford, Suffol. The magnum opus of Hakluyt is *The Principal Navigations, Voyages, Traffiques, and Discoveries of the English Nation* (fol., London, 1598-1600, 3 vols.). Some few copies contain an exceedingly rare map,¹ the first on the Mercator projection made in England according to the true principles laid down by Edward Wright. Hakluyt's great work, though but little read, has been truly called the "prose epic of the modern English nation." It is an invaluable treasure of material for the history of geographical discovery and colonization, which has secured for its author a lasting reputation for research and industry.² In 1601 Hakluyt edited a translation from the Portuguese of Antonio Galvano, *The Discoveries of the World* (4to, London). On the 4th May 1602 he was installed prebendary of Westminster, and in the following year elected archdeacon of Westminster. In the licence of his second marriage (30th March 1604) he is also described as one of the chaplains of the Savoy, and his will contains a reference to chambers occupied by him there up to the time of his death; in another official document he is styled D.D.³ His last publication was a translation of Fernando de Soto's discoveries in Florida, entitled *Virginia richly valued* (London, 1609, 4to). This work was intended to encourage the young colony of Virginia, of which Hakluyt was so zealous a promoter, "to whom England is more indebted for its American possession than to any man of that age."⁴

A number of Hakluyt's MSS., sufficient to form a fourth volume of his collections of 1599-1600, fell into the hands of Samuel Purchas, who inserted them in an abridged form in his *Pilgrimes* (1625-26, fol.). Others are preserved at Oxford (Bib. Bod. MS., Seld. B. 8), which consist chiefly of notes gathered from contemporary authors. Hakluyt died in 1616, and was buried in Westminster Abbey (November 26); by an error in the abbey register it stands under the year 1626. His best monument is the society that flourishes under his name. Founded in 1846 for the purpose of printing rare and unpublished voyages and travels, "it aims at opening by this means an easier access to sources of a branch of knowledge which yields to none in importance, and is superior to most in agreeable variety." The fifty-seven volumes that have been published by the society since its formation have been edited with great discrimination and care, and have come to be regarded as the standard text-books upon their respective subjects. Some are out of print, and others have passed through two editions. The latest volume published is a reissue in a new form of *The Hawkins Voyages*, the first work published by the society. (C. H. C.)

HAKODADI, or **HAKODATE**, a seaport town of Japan, in the old province of Hokukaido, on the southern coast of the island of Yezo or Yesso, in 41° 49' N. lat. and 140° 47' E. long. Its general position, as has been frequently remarked, is not unlike that of Gibraltar, as the town is built along the north-western base of a rocky promontory (1100 feet in height) which forms the eastern boundary of a spacious bay, and is united to the mainland by a narrow sandy isthmus. At the time of Captain Perry's visit in 1851 few of the buildings of Hakodadi, with the exception of its temples and fire-proof warehouses, were more than one story high, and the roofs were made of slight shingles protected against the effects of wind-storms by heavy stones.

¹ Supposed to be the "new map" of the *Twelfth Night*, act iii., scene 2. See *Trans. of New Shakspere Soc.*, 1877-79, pt. 1, 8vo.

² In 1809-12 was published a new edition of it by Woodfall & Evans in 5 vols. The last two contain pieces not comprised in the collection of 1598-1600.

³ *Westminster Abbey Registers*, edited by J. L. Chester, 1876, pp. 113.

⁴ Robertson, *Hist. of America*, vol. iv. p. 171, 10th ed.

Since that date the town has increased considerably in extent, and many of the more modern buildings, such as the new custom-house and the residences of the Government officials, have been erected in a more solid European style. In 1870 there were four European hotels. A new bund or embankment has been constructed along the shore, and several quarters of the town have been laid out in better fashion by the local authorities. Hakodadi is the residence of the governor of Yezo, and the seat of an arsenal. There are four Buddhist and three Shinto temples,—the most important of the former being the Zhioghen-zhi, or Country's Protector, built about 1830. A medical college is maintained in connexion with the Government hospital, and in the neighbourhood of the town an agricultural college has been erected since 1873. The Bay of Hakodadi, says Sir Rutherford Alcock, is completely land-locked, easy of access, and spacious enough for the largest navies to ride in it, with deep water almost up to the shore, and good holding-ground. The Russians have for a considerable time used it as a winter station for their ships, because their own harbours on the coast of Kamchatka are annually frozen up. Their establishment formerly comprised a handsome consular residence, a hospital, warehouses, and workshops, but the consulate was removed from the port in 1871. Hakodadi has a large local trade; but neither its exports nor its imports are very extensive, and as a commercial centre it will not probably be superseded by Endermo. The exports comprise awabi, cuttlefish, sea-weed, béche-demer (iriko), sea-otter skins, and deer horns; as many as 30,000 pairs of the last being sometimes shipped in a year. Lead and coal mines exist in the neighbourhood. There is telegraphic communication with Tokio (Yedo); and a new road has been made to Sapporu (Satsuporu). The population of the town is estimated at 30,000; in 1872 the foreign settlement had 22 residents. Hakodadi, originally a fishing village belonging to a local daimio, was purchased by the Government and incorporated in the imperial fief of Matsmai. It was opened to American commerce in 1854; and there are now also Danish, German, and English consuls. In 1868 the town was taken by the rebel fleet, but it was recovered by the mikado in 1869.

HAL, a town of Belgium, province of South Brabant, is situated on the Senne and the Charleroi canal, 9 miles S.S.W. of Brussels. It has a beautiful Gothic church of the 14th century, very much resorted to by pilgrims on account of a famous miracle-working image of the Virgin. The church has been enriched by a large number of votive gifts, and contains a beautifully carved high altar of white marble. The principal industries are tanning, soap-boiling, the manufacture of paper, and salt-refining. The population in 1869 was 6406:

HALA, or **HALLA** (formerly known as Murtizabad), a town in Hyderabad district, Sind, India, situated on the Alganj canal and immediately connected with the Trunk Road at two points, 25° 48' 30" N. lat., 68° 27' 30" E. long. It was long famous for its glazed pottery and tiles, made from a fine clay obtained from the Indus, mixed with flint. The *sūsis*, or trouser-cloths, for which the town is also celebrated, are manufactured to the value of £750 yearly. Hala was built about 1800 in consequence of old Hala, 2 miles distant, being threatened with encroachment by the Indus. Among the antiquities round which the new town has grown up are the tomb and mosque of a pīr or saint, who died in the 16th century, and in whose honour a fair, largely attended by Mahometans from all parts of the province, is held twice a year. The local trade, chiefly of grain, piece goods, *ghis*, cotton, and sugar, is valued approximately at £3900; the transit trade (in the same articles) at about £700. Population (1872), 4096, including 2640 Mahometans and 1234 Hindus.

HALAS, a corporate town of Hungary, in the megye or county of Pest-Pilis-Solt-Kis-Kun, is situated about 76 miles S.S.E. from Budapest, in 46° 24' N. lat. and 19° 31' E. long. The most noteworthy buildings are the Calvinist and Roman Catholic churches, and the Jewish synagogue. Halas contains also a Protestant gymnasium, various literary institutions, and a local tribunal. The inhabitants of the town and neighbourhood are mostly engaged in cattle-breeding and agricultural pursuits. Not far from Halas is a lake of the same name, containing an island which was once fortified, and served as a place of refuge to the inhabitants from the incursions of the Turks. Prior to 1876 Halas belonged to the old district of Little Cumania. In the spring of 1879 the town was much injured by floods. The population in 1870 amounted to 13,127, of whom the greater number were Magyars.

HALBERSTADT, the chief town of a circle in the government district of Magdeburg, Prussian province of Saxony, is situated in a beautiful and fertile country on the Holzemme, a tributary of the Elbe, and at the junction point of four railways, 29 miles S.W. of Magdeburg. It has an antique appearance, and in a large number of the buildings the mediæval wood-architecture is still preserved. About a mile and a half distant from Halberstadt are the *Spiegel'sche Berge*, from which there is obtained a fine view of the surrounding country. The town possesses a cathedral in the Pointed style, dating from the 13th and 14th centuries, and restored between 1850 and 1871, containing a rich Gothic screen of the date of 1510, other interesting antiquities, beautiful glass windows, and several valuable paintings. Of the remaining churches the only one of special interest is the *Liebfrauenkirche*, a basilica in the later Romanesque style, dating from the 12th and 13th centuries, and restored in 1848, containing noteworthy wall paintings and figures in relief. Among the other old buildings may be mentioned the town-house, dating from the 14th century and restored in the 17th century; the town hall crypt, dating from the 15th century; and the *Petershof*, formerly the residence of the bishop, but now used as a custom house. The principal educational establishments are the gymnasium—the new buildings for which were opened in 1875—with a library of 30,000 volumes; the real-school of the first order; the normal school, connected with which there is a deaf and dumb institute; and the provincial trade school. Near the cathedral is a building called the temple of friendship which contains a collection of the portraits of the friends of the poet Gleim, who was a resident in the town, and whose house was the resort of a large circle of poets and scholars. In the same neighbourhood a beautiful monument in the Early Pointed style has been elected to the memory of those who fell in the late Franco-German war. The principal manufactures of the town are linen and woollen cloth, leather, paper, gloves, wadding, cigars, soap, oil, sugar, chemical products, brandy, and liqueurs. The population in 1875 was 27,757.

Halberstadt owes its origin to the foundation in the 9th century of the bishopric of which it became the seat. It received town rights from Bishop Arnulf in 998. It was burnt down in 1113 by the emperor Henry V., and in 1179 by Henry the Lion. At the peace of Westphalia in 1648 the bishopric was united as a principality to Brandenburg. At the Tilsit peace in 1807 it was joined to Westphalia, but in 1813 it again came into the possession of Prussia. See Lucanus, *Der Dom zu Halberstadt*, 1837, *Wegweiser durch Halberstadt*, 2d edition 1866, and *Die Liebfrauenkirche zu Halberstadt*, 1872; Scheffer, *Inschriften und Legenden Halberstädtischer Bauten*, 1864; Schmidt, *Urkundenbuch der Stadt Halberstadt*, Halle, 1878.

HALBERT, HALBARD (French, *Halebarde*), a weapon consisting of an axe-blade balanced by a pick and having an elongated pike-head at the end of the staff, which was usually about 5 or 6 feet in length. Various derivations have been suggested for the term, but M. Demmin seems to

have hit the right one in the German *Halb-barthe*, "half battle-axe." The earliest halberts represented in the miniatures of the 14th century, or preserved in the collections of Switzerland and Germany, have the axe-blade often prolonged beyond the end of the staff, and thus resemble the English bill of the 15th century. Fauchet, in his *Origines des Dignitez*, printed in 1600, states that Louis XI. of France ordered certain new weapons of war called *hallebardes* to be made at Angers and other places in 1475. The Swiss had a mixed armament of pikes and halberds at the battle of Morat in 1476. We find the same mixture of billmen and halbardiers in the English army at the same period. In the 15th and 16th centuries the halberds became larger, and the blades were formed in many varieties of shape, often engraved, inlaid, or pierced in open work, and exquisitely finished as works of art. This weapon was in use in England from the reign of Henry VII. to the reign of George III., when it was still carried by sergeants in the guards and other infantry regiments. It is still retained as the symbol of authority borne before the magistrates on public occasions in some of the burghs of Scotland. The Lochaber axe may be called a species of halbert furnished with a hook on the end of the staff at the back of the blade.

HALDANE, JAMES ALEXANDER (1768–1851), whose disinterested labours in the cause of religion have secured for his name an honourable place in the ecclesiastical history of Scotland, was the younger son of Captain James Haldane of Gleneagles, Perthshire, and was born at Dundee on July 14, 1768. Educated first at Dundee and afterwards at the High School and university of Edinburgh, he shortly after the completion of his sixteenth year entered the service for which he had been from his childhood destined, by joining the "Duke of Montrose" East Indiaman as a midshipman. After four voyages to India he in the summer of 1793 was nominated to the command of the "Melville Castle"; but having, during a long and unexpected detention of his ship, begun a careful study of the Bible, he came under deep religious impressions and, somewhat abruptly resolving to quit the naval profession, returned to Scotland before his ship had sailed. About the year 1796 he became acquainted with the celebrated evangelical divine, Simeon of Cambridge, in whose society he made through Scotland more than one tour, in the course of which he endeavoured by tract-distribution and other means to awaken others to somewhat of that interest in religious subjects which he himself so strongly felt. In May 1797 he preached, at Gilmerton near Edinburgh, his first sermon with a success which was considered to be very encouraging; and during the next few years he made repeated missionary journeys, preaching wherever he could obtain hearers, and generally in the open air. Not originally disloyal to the Church of Scotland, he was gradually driven by the hostility of the Assembly and the exigencies of his position into a separatistic attitude; in 1799 he was ordained on the principles of Independency as pastor of a large congregation in Edinburgh, to which he continued gratuitously to minister for more than fifty years; and in 1808 he made public avowal of his conversion to Baptist views. As advancing years compelled him to withdraw from the more exhausting labours of itineracy and open-air preaching, he sought more and more to influence the discussion of current religious and theological questions by means of the press, and by numerous pamphlets took part in the controversies connected with the names of Edward Irving, Erskine of Linlathen, Campbell of Row, and others. His latest works were a treatise on the *Doctrine of the Atonement* (1845) and an *Exposition of the Epistle to the Galatians* (1848). He died on the 8th of February 1851.

HALDANE, ROBERT (1764-1842), elder brother of the preceding, and intimately associated with him in many of his labours, was born in London on February 28, 1764. After attending classes in the Dundee grammar school and in the High School and university of Edinburgh he in 1780 joined H. M. S. "Monarch," of which his uncle Lord Duncan was at that time in command, and in the following year was transferred to the "Foudroyant," on board of which, during the night engagement with the "Pegase," he distinguished himself so much that Captain Jervis (afterwards Lord St Vincent) wrote to Admiral Duncan predicting a brilliant future for his nephew. Haldane was afterwards present at the relief of Gibraltar, but at the peace of 1783 he finally left the navy, and soon afterwards settled on his estate of Airthrey, near Stirling. The earlier phases of the French Revolution as they occurred attracted his attention and at first excited his deepest sympathy, a sympathy which induced him, at the cost of making many enemies, to avow his strong disapproval of the war with France. As his bright and oversanguine visions of a new order of things to be ushered in by political change disappeared, he, unlike Wordsworth's "Solitary," began to direct his thoughts to religious subjects, and underwent a spiritual change which, while neither sudden nor violent, was decisive and complete. Resolving to devote himself and his means wholly to the advancement of Christianity, his first proposal for that end, made in 1796, was to organize a vast mission to Bengal, of which he was to provide the entire expense; with this view the greater part of his estate was sold, but after every arrangement had been well nigh completed, the East India Company refused to sanction the scheme, which therefore had to be reluctantly abandoned. In December 1797 he joined his brother and some others in the formation of the "Society for the Propagation of the Gospel at Home"; and in building chapels or "tabernacles" for its congregations, in supporting its missionaries, and in maintaining institutions for the education of young men to carry on its work, he in the course of the twelve years which followed is stated on good authority to have expended upwards of £70,000. In 1816 he visited the Continent, and first at Geneva and afterwards in Montauban (1817) occupied himself in lecturing with surprising success to theological students, among whom were Malan, Monod, and Merle D'Aubigné. Returning to Scotland in 1819, he lived partly on his estate of Auchengray and partly in Edinburgh, and like his brother took an active part, chiefly through the press, in many of the religious controversies of the time. He died on the 12th of December 1842.

In 1816 he published a work on the *Evidences and Authority of Divine Revelation*, and in 1819 the substance of his theological prelections in a *Commentaire sur l'Épître aux Romains*. Among his later writings, besides numerous pamphlets on what was known as "the Apocrypha controversy" and on the sabbatarian question, are a treatise on the *Inspiration of Scripture* (1828), which has passed through seven editions, and a later *Exposition of the Epistle to the Romans* (1835), which has been frequently reprinted, and has been translated into French and German. See *Memoirs of R. and J. A. Haldane*, by Alexander Haldane (1852).

HALE, SIR MATTHEW (1609-1676), lord chief-justice of England, was born on November 1, 1609, at Alderley in Gloucestershire, where his father, a retired barrister, had a small estate. His paternal grandfather was a rich clothier of Wotton-under-Edge; on his mother's side he was connected with the noble family of the Poyntzes of Acton. Both his parents having died before he was five years old, the future chief-justice was placed by his guardian under the care of Mr Staunton, vicar of Wotton-under-Edge, through whose influence he became strongly imbued with puritanical principles. There he remained till he attained his sixteenth year, when he entered Magdalen Hall, Oxford, under the tuition of the puritanical but learned Obadiah Sedgwick. At Oxford Hale devoted himself for several

terms to the study of Aristotle and Calvin with a view to holy orders, and manifested that steadiness and application which in after years secured his reputation and advancement. But suddenly there came a change. The diligent student, at first attracted by a company of strolling players, threw aside his studies, and plunged carelessly into gay society. He soon decided to change his profession; and resolved to trail a pike as a soldier under the prince of Orange in the Low Countries. Before going abroad, however, Hale found himself obliged to proceed to London in order to give instructions for his defence in a legal action which threatened to deprive him of his patrimony. His leading counsel was the celebrated Serjeant Glanville, who, perceiving in the acuteness and sagacity of his youthful client a peculiar fitness for the legal profession, succeeded, with much difficulty, in inducing him to renounce his military for a legal career, and on the 8th November 1629 Hale became a member of the honourable society of Lincoln's Inn.

He immediately resumed his habits of intense application. The rules which he laid down for himself, and which are still extant in his handwriting, prescribe sixteen hours a day of close application, and prove, not only the great mental power, but also the extraordinary physical strength he must have possessed, and for which indeed, during his residence at the university, he had been remarkable. During the period allotted to his preliminary studies, he read over and over again all the year-books, reports, and law treatises in print, and at the Tower of London and other antiquarian repositories examined and carefully studied the records from the foundation of the English monarchy down to his own time. Even the common-place book which he composed as the result of his study and research may, according to Lord Campbell, "be considered a *corpus juris* embracing and methodizing all that an English lawyer on any emergency could desire to know." But Hale did not confine himself to law. He dedicated no small portion of his time to the study of pure mathematics, to investigations in physics and chemistry, and even to anatomy and architecture; and there can be no doubt that this varied learning enhanced considerably the value of many of his judicial decisions.

Hale was called to the bar in 1637, and almost at once found himself in full practice. Though neither a fluent speaker nor bold plender, in a very few years he was at the head of his profession. He entered public life at perhaps the most critical period of English history. Two parties were contending in the state, and their obstinacy could not fail to produce a most direful collision. But amidst the confusion Hale steered a middle course, rising in reputation, and an object of solicitation from both parties. Taking Pomponius Atticus as his political model, he was persuaded that a man, a lawyer, and a judge could best serve his country and benefit his countrymen by holding aloof from partisanship and its violent prejudices, which are so apt to distort and confuse the judgment. But he is best vindicated from the charges of selfishness and cowardice by the thoughts and meditations contained in his private diaries and papers, where the purity and honour of his motives are clearly seen. It has been said, but without certainty, that Hale was engaged as counsel for the earl of Strafford; he certainly acted for Archbishop Laud, Lord Maguire, Christopher Love, the duke of Hamilton, and others. It is also said that he was ready to plead on the side of Charles I. Had that monarch submitted to the court. The parliament having gained the ascendancy, Hale signed the Solemn League and Covenant, and was a member of the famous Assembly of Divines at Westminster in 1644; but although he would undoubtedly have preferred a Presbyterian form of church government, he had

no serious objection to the system of modified Episcopacy proposed by Ussher. Consistently with his desire to remain neutral, Hale took the engagement to the Commonwealth as he had done to the king, and in 1653, already serjeant, he became a judge in the Court of Common Pleas. Two years afterwards he sat in Cromwell's parliament as one of the members for Gloucestershire. After the death of the Protector, however, he declined to act as a judge under Richard Cromwell, although he represented Oxford in Richard's parliament. At the Restoration in 1660 Hale was very graciously received by Charles II., and in the same year was appointed chief baron of the exchequer, and accepted, with extreme reluctance, the honour of knighthood. After holding the office of chief baron for eleven years he was raised to the higher dignity of lord chief-justice, which he held till February 1676, when his failing health compelled him to resign. He retired to his native Alderley, where he died on December 25th of the same year. He was twice married, and survived all his ten children save two.

As a judge, Sir Matthew Hale discharged his duties with resolute independence and careful diligence. Lord Campbell says of him that "he is certainly to be considered the most eminent judge who ever filled the office [of chief baron]; and being promoted to be chief-justice of England, he gave new dignity to the supreme magistracy which had been illustrated by Gascoigne, by Fortescue, and by Coke." His sincere piety made him the intimate friend of Barrow, Tillotson, Wilkins, and Stillington, as well as of the Non-conformist leader Baxter. He is chargeable, however, with the condemnation and execution of two poor women tried before him for witchcraft in 1664, a kind of judicial murder then falling under disuse. He is also reproached with having hastened the execution of a soldier for whom he had reason to believe a pardon was preparing.

Of Hale's legal works the only two of importance are his *Historia Placitorum Coronæ*, or *History of the Pleas of the Crown*, first published in 1739; and the *History of the Common Law of England*, with an *Analysis of the Law*, &c., 1713. Among his numerous religious writings the *Contemplations, Moral and Divine*, occupy the first place. Others are *The Primitive Origination of Man*, 1677; *Of the Nature of True Religion*, &c., 1684; *A Brief Abstract of the Christian Religion*, 1688. One of his most popular works is the collection of *Letters of Advice to his Children and Grandchildren*. He also wrote an *Essay touching the Gravitation and Nongravitation of Fluid Bodies*, 1673; *Difficiles Nuptæ*, or *Observations touching the Torricellian Experiment*, &c., 1675; and a translation of the *Life of Pomponius Atticus*, by Cornelius Nepos. His efforts in poetry were inauspicious. He left his valuable collection of MSS. and records to the library of Lincoln's Inn. His life has been written by Burnet, 1682; by Williams, 1835; by Roscoe, in his *Lives of Eminent Lawyers*, in 1838; and by Lord Campbell, in his *Lives of the Chief Justices*, in 1849.

HALES, STEPHEN (1677-1761), physiologist and inventor, was born at Beckesbourn in Kent, on the 7th September 1677. He was the sixth son of Thomas Hales, whose father, Sir Robert Hales, was created baronet by Charles II. in 1670. Of his early education little is known, but in June 1696 he was entered as a pensioner of Bene't (now Corpus Christi) College, Cambridge, with the view of taking holy orders. On 16th April 1702 he was elected and in February 1703 admitted to a fellowship. He received the degree of master of arts in 1703, and of bachelor of divinity in 1711. While at college one of his most intimate friends was William Stukeley, with whom he studied anatomy, chemistry, &c. In 1710 Hales was presented to the perpetual curacy of Teddington in Middlesex, where he remained all his life, notwithstanding that he was subsequently appointed rector of Porlock in Somerset, and later of Farringdon in Hampshire. In March 1717 he was elected fellow of the Royal Society, to whose *Transactions* he contributed many valuable papers. In 1732 he was named one of a committee for establishing

a colony in Georgia, and the next year he received the degree of doctor of divinity. He was appointed almoner to the princess-dowager of Wales in 1750. On the death of Sir Hans Sloane in 1753, Hales was chosen foreign associate of the French Academy of Sciences. He died at Teddington, January 4, 1761.

Hales is celebrated as the inventor of a "ventilator," by means of which fresh air was introduced into jails, hospitals, mines, ships' holds, &c. In the four years (1749-52) after its introduction into the Savoy prison, only 4 prisoners died; while previously the mortality had been from 50 to 100 per annum. The invention met with immediate favour, especially in France. Hales was the designer of other inventions by means of which sea-water was distilled, corn cleaned and preserved, meat preserved on long voyages, &c.

His chief writings are his *Statical Essays* (see CHEMISTRY, vol. v. p. 461), consisting of *Vegetable Staticks*, or an *Account of some Statical Experiments on the Sap in Vegetables* (1727), and *Hæmostaticks*, or an *Account of Hydraulick and Hydrostatick Experiments made on the Blood and Blood-vessels of Animals* (1733). His essay on *The Means of Dissolving the Stone in the Bladder*, &c., gained him the Copley gold medal in 1737. His *Admonition to the Drinkers of Gin, Brandy*, &c., appeared in 1734; the *Vegetable Staticks*, translated by Buffon, in 1735, and the *Hæmostaticks*, by M. de Sauvages, in 1744. For sketch of his life, with portrait, see *Gardner's Chronicle*, 1877, pp. 16-17.

HALÉVY, JACQUES FRANÇOIS FROMENTAL (1799-1862), a celebrated French musician, was born May 27, 1799, at Paris. He studied at the Paris Conservatoire under Berton and Cherubini, and in 1819 gained the grand prix de Rome with a cantata called *Herminie*. In accordance with the conditions of his scholarship he started for Rome, where he devoted himself to the study of Italian music, and wrote an opera and various minor works. His first opera produced in Paris after his return from Italy was called *L'Artisan*, which saw the light at the Théâtre Feydeau in 1827, apparently without much success. Other works of minor importance, and now forgotten, followed, amongst which only a ballet named *Manon Lescaut*, produced in 1830, deserves mention. Five years later, in 1835, Halévy produced the tragic opera *La Juive* and the comic opera *L'Éclair*, and on these works his immortality is mainly founded. Both have kept the stage to the present day, and will probably survive changes of taste even greater than those which music has undergone in France during the last forty years. *The Jewess* is in every way representative of the French *grand-opéra*, the modern outgrowth of Gluck's music-drama with a strong admixture of the Italian element and of an excess of spectacular splendour wholly strange to the classic simplicity of the original. It is curious that the *grand-opéra*, although an essentially national product of France, was both initiated and brought to its highest perfection by two Germans—Gluck and Meyerbeer. The genius of the latter was fatal to Halévy's fame. By the side of the *Huguenots* the merits of *La Juive* appear in almost diminutive proportions. At the same time Halévy's work ought not to be treated with contempt. It is full of fine dramatic features, and especially the introduction of the Jewish element—with which Halévy, himself a Jew, was well acquainted—gives a peculiar interest on this score. *L'Éclair* is a curiosity of musical literature. It is written for two tenors and two soprani, without a chorus, and displays the composer's mastery over the most refined effects of instrumentation and vocalization in a favourable light. After these two works, to which Halévy owed his fame and his seat at the Institute, he wrote numerous operas of various genres, amongst which only *La Reine de Chypre*, a spectacular piece analysed by Wagner in one of his Paris letters (1841), and *La Tempesta*, in 3 acts, written for Her Majesty's Theatre, London (1850), need be referred to. In addition to his

productive work Halévy also rendered valuable services as a teacher. He was professor at the Conservatoire from 1827 till his death—some of the most successful amongst the younger composers in France, such as Gounod, Victor Massé, and Georges Bizet, the author of *Carmen*, being amongst his pupils. Halévy also tried his hand at literature, and there exists an agreeable volume of *Souvenirs et Portraits* from his pen. He died at Nice, March 17, 1862.

HALIBURTON, THOMAS CHANDLER (1796–1865), long a judge of Nova Scotia, and a popular literary satirist, was born at Windsor, Nova Scotia, in 1796, and received his education there, at King's College. He was called to the bar in 1820, and took part in the legislature of his native province as a member of the House of Assembly. He distinguished himself as a barrister, and in 1828 was promoted to the bench as a chief-justice of the common pleas. But it is as the brilliant humorist and satirist that he is now remembered; for his labours alike as a barrister and a member of parliament were limited to his own province, and could scarcely beget anything beyond a local reputation. Yet confined as he thus was to so narrow a sphere, a true estimate of its disadvantages is necessary in order to do justice to the vigorous individuality of his writings. He was a native of what was then a small and isolated maritime province, detached from Canada. Its exports consisted chiefly of lumber and the produce of its fisheries; and with those trade was carried on with Great Britain, the West Indies, and the United States. Its entire population at the time when Haliburton was called to the bar, including Indians, African refugees from the States, and the Acadian descendants of the original French population, did not amount to 97,000. The English settlers were largely composed of refugees from the former British colonies, animated by the strong Conservative sympathies of the old colonial loyalists. The French Acadians were Roman Catholics, and their national traditions and religion equally tended to alienate them from the neighbouring republic.

In politics Haliburton adhered through life to the Conservative party; and the influence of his early associations is traceable in most of his writings. He was still at the bar when he wrote *An Historical and Statistical Account of Nova Scotia*, in 2 vols. Canada, it will be remembered, then consisted of Upper and Lower Canada only, and, with the French population of the latter and nearer province, was even stranger to the Nova Scotian than the New England States. The leisure which judicial duties secured admitted of literary relaxations in which Judge Haliburton's fine sense of the humorous had free play; and in 1835 he contributed anonymously to a local paper a series of letters professedly depicting the peculiarities of the genuine Yankee. These sketches, which abounded in clever picturings of national and individual character, drawn with great satirical humour, were collected in 1837, and published under the title of *The Clockmaker, or Sayings and Doings of Samuel Slick of Slickville*. A second series followed in 1838, and a third in 1840. *The Attaché, or Sam Slick in England* (2 vols. 8vo), was the result of a visit there in 1841. This also was followed up by a second series in 1844. His other works include—*The Old Judge, or Life in a Colony*; *The Letter Bag of the Great Western*; *Rule and Misrule of the English in America*; *Traits of American Humour*; and *Nature and Human Nature*.

While the judge was thus diligent in such literary recreations, he continued to secure popular esteem in his judicial capacity. In 1840 he was promoted to be a judge of the supreme court; but within two years he resigned his seat on the bench, removed to England, and after a time entered parliament as the representative of Lauceston, in the Conservative interest. His literary reputation awoke expecta-

tions which were not fulfilled. The bar has rarely proved to be an apt school for training the parliamentary debater, and he was too far advanced in life to adapt himself to the novel requirements of the English House of Commons. The last time he spoke he was listened to with interest on the Canadian defences. But the tenure of his seat for Lauceston was brought to an end by the dissolution of the parliament in 1865, and he did not again offer himself to the constituency. His death followed in the month of August of the same year, at Gordon House, Isleworth, when he was in his seventieth year.¹

HALIBUT. See HOLIBUT.

HALICARNASSUS, an ancient Greek city on the southwestern coast of Asia Minor, built on a picturesque and advantageous site at the northern end of the Ceramic Gulf or Gulf of Cos. It originally occupied only the small island of Zephyria, close to the shore, but in course of time this island was united to the mainland and the city extended so as to incorporate Salmacis, an older town of the Leleges and Carians. About the foundation of Halicarnassus various traditions were current; but they agree in the main point as to its being a Dorian colony, and the figures on its coins, such as the head of Medusa or Minerva, the head of Neptune, or the trident, give support to the statement that the mother cities were Troezen and Argos. The inhabitants appear to have accepted as the legendary founder Anthes, mentioned by Strabo, and were proud of the title of Anthedæ. At an early period Halicarnassus was a member of the Doric Hexapolis, which included Cos, Cnidus, Lindus, Camirus, and Ialysus; but one of the citizens, Agasicles, having taken home the prize tripod which he had won in the Triopian games instead of dedicating it according to custom to the Triopian Apollo, the city was cut off from the league. In the time of Xerxes we find Halicarnassus under the sway of a certain Artemisia, who made herself famous by the assistance she rendered to the great Persian invader. Pigres, her brother or son, was the reputed author of the *Batrachomyomachia*. Of Pisindalis, her son and successor in the sovereignty, little is known; but Lygdamis, who next attained to power, is notorious for having put to death the poet Panyasis and caused Herodotus, the greatest of the Halicarnassians, to leave his native city (c. 457 B.C.). About the close of the 5th century B.C., the power of Athens became predominant over Halicarnassus and other Dorian cities of Asia, but the peace of Antalcidas in 387 made them subservient to Persia; and it was under Mausolus, a Persian satrap of almost independent authority, that Halicarnassus attained its highest prosperity. Struck by the natural strength and beauty of its position, Mausolus removed thither from Mylasa, and increasing its population by the inhabitants of six towns of the Leleges, devoted himself to its embellishment and defence. On his death he was succeeded by his widow and sister, Artemisia, whose military ability was shown by the stratagem by which she captured the Rhodian vessels attacking her city, and whose magnificence and taste have been perpetuated to all time by the "Mausoleum," the monument she erected to her husband's memory. In the execution of this wonderful enterprise she employed the architects Satyrus and Pythius,

¹ Judge Haliburton was descended from the branch of the Newmans and Merton family which figures in the genealogical memorials of the Haliburtons in their relation to that of Sir Walter Scott, whose paternal grandmother was Barbara Haliburton. The note of all the families of the name drawn up by the father of the poet and novelist was prepared in reply to inquiries of the father of Judge Haliburton, with a view to the establishment of his claims to certain family property. Of a younger branch of the Newmans family that went to Jamaica, one member removed to Massachusetts. A son of his, the father of the judge, migrated to Nova Scotia, and there, in 1790, he revived old hereditary rights, and reclaimed relationship with the original Scottish stock.

and the sculptors Scopas, Leschares, Bryaxis, and Timotheus; and though she died before its completion, they continued it with all the enthusiasm of artists. In the history of Halicarnassus the next important events were connected with the conquests of Alexander the Great. Memnon, satrap of the west coast, having taken refuge within its walls after the battle of Granicus, it was besieged by the Macedonians, captured, and plundered. Not long afterwards we find the citizens receiving the present of a gymnasium from Ptolemy, and building in his honour a stoa or portico; but the city never recovered altogether from the disasters of the siege, and Cicero describes it as almost deserted. The site is now occupied by the town of Budrun, but the ancient walls can still be traced in nearly all their circuit, and the position of several of the temples and public buildings can be fixed with considerable certainty.

From the ruins of the Mausoleum sufficient has been recovered by the excavations carried out in 1867 by C. T. Newton to enable a fairly complete restoration of its design. According to Mr Pullan, Mr Newton's collaborator, the building consisted of five parts—a basement or podium, a pteron or enclosure of columns, a pyramid and pedestal, and a chariot group. The basement, probably 51 feet in height, and covering an area of 114 feet by 92, was built of blocks of greenstone and cased with marble, the monotony of the plain-courses being possibly broken by one or more belts of frieze. The pteron, 37½ feet in height, consisted (according to Pliny) of thirty-six columns of the Ionic order, enclosing a square *cella*, the walls of which were relieved by friezes. From the portions that have been recovered it appears that the principal frieze of the pteron represented combats of Greeks and Amazons. "Throughout," says Mr Newton, "there is a skilful opposition of nude and draped male and female forms; but the groups and figures are much less intermixed than in the Parthenon and Phigalian friezes. The whole surface was coloured, the ground of the relief being ultramarine and the flesh a dim red, while the drapery and armour were picked out with various hues." Fragments have been found of two other friezes of doubtful position in the monument, one representing a chariot race and the other a centaur fight. Above the pteron rose the pyramid, approximately 108 feet long and 86 feet wide at the base, and mounting by 24 steps to an apex or pedestal, which possibly had a length of 25 feet 6 inches and a breadth of 20 feet. On this apex stood the quadriga or chariot with the figure of Mausolus himself and an attendant deity acting as his charioteer. The height of the statue of Mausolus—it has happily been preserved and forms part of the treasures of the British Museum—is 9 feet 9½ inches without the plinth. The hair rising from the forehead falls in thick waves on each side of the face and descends nearly to the shoulder; the beard is short and close, the face square and massive, the eyes deep set under overhanging brows, the mouth well formed with settled calm about the lips. The drapery, consisting of a chiton and mantle, is grandly composed. Such are the main features of the great Mausoleum which deservedly ranked among the wonders of the world. The minor edifices and sculptural remains of Halicarnassus are of secondary moment. Of well-preserved inscriptions the number is comparatively few; but one or two (such as that containing the names of Lygdamis and Panyasis) are of no small interest to the archaeologist.

For further details see Rose, *Reise durch den Inseln Griechenlands*; Hamilton's *Researches in Asia Minor*; and Newton's *History of Discoveries at Halicarnassus*, 1862-3, and his *Travels in the Levant*, 1865.

HALIFAX, a municipal and parliamentary borough and market-town of England, in the northern division of the West Riding of Yorkshire, is situated on a gentle acclivity almost surrounded by hills, on the small river Hebble near its junction with the Calder, 7 miles south-west of Bradford. Originally its streets were narrow and irregular, but many of the older houses have been pulled down and new streets opened up, while the constant additions made to it through the rapid increase of population have completely changed its appearance. The principal buildings are the parish church of St John, the restoration of which was completed in 1879 at a cost of £16,000, a structure in the Perpendicular style, of different dates, and having the western tower 117 feet in height; All Souls Church, begun in 1859 from the designs of Sir Gilbert Scott, and erected at the expense of Mr Edward Akroyd, in the Early Decorated style, very richly ornamented with statues and carvings in Italian marble, serpentine, and alabaster, and consisting of nave, aisles, transepts, and chancel, with a very graceful tower and spire

at the north-west angle 236 feet in height, and a sacristy at the north-east; the Square Church, erected by the Congregationalists in 1857 at a cost of £16,000, an ornate cruciform building with a tower and elaborate crocketed spire rising to a height of 235 feet; the town-hall, completed in 1863 after the designs of Sir Charles Barry at a cost of £40,000; the infirmary, a large and elegant building in which medical and surgical aid is afforded to outdoor as well as indoor patients; the Waterhouse charity school, a handsome set of buildings forming three sides of a quadrangle, erected in 1855; the Crossley almshouses, erected and endowed by Sir Francis and Mr Joseph Crossley; the piece-hall, a large quadrangular structure occupying more than 2 acres of ground, erected in 1799 for the lodgment and sale of piece goods, but now used as a market for fish and vegetables; the free grammar school, founded in 1585 under royal charter for instruction in the classical languages; the Crossley orphan home and school, built by the Crossley

Plan of Halifax.

brothers at a cost of £46,000; the museum, the oddfellows' hall, the working men's college, the mechanics' institute, the assembly and concert rooms, and the theatre. There are three public parks, viz., Savile Park, 50 acres in extent; the People's Park, 12½ acres, laid out in a high ornamental style from the designs of Sir Joseph Paxton, and presented to the town in 1858 by Sir Francis Crossley; and the Shrogg's Park, 25 acres, opened in 1877. The North Bridge, a fine structure of iron, spans the Hebble valley in two arches. Halifax derives its importance from its manufactures of cloth, which began in the 15th century. It ranks in Yorkshire with Leeds, Bradford, and Huddersfield as a seat of the woollen and worsted manufacture. The principal staples are carpets, cashmeres, orleanses, coburgs, merinoes, lastings, alpacas, damasks, baizes, broad and narrow cloths, kerseymeres, blankets, muslin-de-laines, shalloons, and figured vestings. A considerable number of persons are employed in iron-works, machine works, and chemical works, and in the

neighbouring coal-mines and stone quarries. The borough sends two members to parliament. The parish is the largest in Great Britain, embracing 79,200 acres. The population of the municipal and parliamentary borough in 1861 was 37,014, and in 1871 (with an extended area of 3704 acres) 65,510.

Two derivations are given for the name Halifax. According to Camden it means "holy hair," and he accounts for the origin of the name from the fact that the head of a virgin who had been murdered by a wicked clerk was suspended on a tree in the neighbourhood, which came to be much resorted to by pilgrims. According to another account, the name means "holy face," and is derived from an image of St John once preserved in a neighbouring hermitage. The first mention of the town is in the 12th century, when its church was granted by William, earl of Warren, to the priory of Lewes in Sussex. When its manufactures commenced in the beginning of the 15th century the number of its houses was only 15, but they had increased in 1540 to 520. It is said to have received a considerable accession to its inhabitants and impulse to its prosperity from the merchants who fled from the Netherlands to escape the persecution carried out under the auspices of the duke of Alva. In 1642 it was garrisoned by the forces of the parliament, and near it at a place still called the Bloody Field an engagement took place between them and the royalists. In the forest of Hardwick, then coextensive with the parish of Halifax, there at one time existed a custom called the "Gibbet Law," according to which any person suspected to be in the unlawful possession of goods to the value of 13½d. was tried by the frith-burghers of the liberty, and if condemned was executed on a market day by a kind of axe resembling the modern guillotine. The last execution took place in 1650. A number of eminent men have been born in the town or neighbourhood of Halifax, including the mathematician Henry Briggs, Archbishop Tillotson, Sir Henry Savile, and John Foster. Daniel Defoe resided for some time in the town.

HALIFAX, a city and seaport of British North America, capital of Nova Scotia, is situated on the south-east coast of the province on the declivity of a hill about 250 feet in height, rising gradually from the south-west side of Chebucto Bay or Halifax harbour, a deep inlet of the sea. The hill is commanded by a citadel about a mile in circumference and of great strength, and the harbour is defended by several forts and batteries. Originally the houses were chiefly of wood plastered or stuccoed, but the frequent recurrence of fires has led to a more general use of stone or brick as building materials. Many of them have an imposing and elegant appearance; and the streets are spacious and regularly laid out, crossing each other at right angles. Including its suburbs the city is from 2 to 3 miles long and about 1 mile broad. The principal buildings are the Government house, the official residence of the lieutenant-governor of Nova Scotia, a solid sombre-looking structure at the south of the town; the provincial building, near the centre of the town, 140 feet long by 70 feet broad, with a fine Ionic colonnade, and comprising the Government offices, the post-office, the city library and the provincial museum; the parliament building, the courthouse, the admiralty house, the exchange, the Roman Catholic cathedral of St Mary, the rooms of the young men's Christian association, the Wellington barracks, the military hospital, the lunatic asylum, the workhouse, the jail, and the penitentiary. The educational establishments include the Dalhousie college and university, the St Mary's Roman Catholic college, the Presbyterian theological college, the High School, the almshouse of industry for girls, two orphan asylums, a blind asylum, a lunatic asylum for the Lower Provinces, two industrial schools, and nearly twenty public schools. A lighthouse has been erected on the west side of the entrance to the harbour on a small island off Sambro Cape. After passing Sambro the course for large vessels is to the west of M'Nab's Island, on which a lighthouse has also been erected; but there is also a passage sufficient for small vessels to the east of the island. Recently a lighthouse has been erected on the west side of St George's Island opposite the city. Halifax is the seat of a considerable fishery. Its principal trade is with

Great Britain, the British colonies, and the United States. In 1878 the number of ships that entered was 887, with a tonnage of 347,336. The value of imports was \$4,991,205, and of exports \$4,102,335. The imports are chiefly manufactures from England, manufactures and produce from the United States, and sugar, molasses, rum, and other products from the West Indies; the chief exports are dried and pickled fish, timber, cattle, agricultural and dairy produce, fur, and whale and seal oil. Halifax is now used instead of Portland in the State of Maine as the winter port (the St Lawrence being closed with ice) for the Dominion of Canada. The principal industries of Halifax are ironfounding, brewing, distilling, sugar-refining, and the manufacture of woollen and cotton goods, paper, leather, tobacco, gunpowder, agricultural and musical instruments, carriages, machinery, candles, and soap. On account of its fine air and the beautiful scenery of the neighbourhood, Halifax has a high reputation as a watering-place. An abundant supply of water for the city is obtained from two lakes 2 miles distant. The city is the seat of an Anglican bishop and a Roman Catholic archbishop. Nearly one-third of the population is Roman Catholic. It is named after the earl of Halifax, and was founded by Governor Cornwallis in 1749. In 1790 it contained only 700 houses and 4000 inhabitants. It was declared a free port in 1817, at which time the number of houses was 1200. The population in 1861 was 25,026, and in 1871, 29,582.

HALIFAX, CHARLES MONTAGUE, EARL OF (1661-1715), English statesman and poet, fourth son of the Honourable George Montague, who was fifth son of the first earl of Manchester, was born at Horton, Northamptonshire, on the 16th April 1661. In his fourteenth year he was sent to Westminster school, where he was chosen king's scholar in 1677, and distinguished himself in the composition of extempore epigrams made according to custom upon these appointed for king's scholars at the time of election. In 1682 he entered Trinity College, Cambridge, where he acquired a solid knowledge of the classics and surpassed all his contemporaries at the university in logic and ethics. Latterly, however, he preferred to the abstractions of Descartes the practical philosophy of Sir Isaac Newton; and he was one of the small band of students who assisted Newton in forming the Philosophical Society of Cambridge. But it was his facility in verse-writing, and neither his scholarship nor his practical ability, that first opened up to him the way to fortune. His clever but absurdly panegyric poem on the death of Charles II., which was published in the *Book of Condolence and Congratulation* presented by the university to James II., secured for him the notice of the earl of Dorset, who invited him to town and introduced him to the principal wits of the time; and in 1687 his joint authorship with Prior of the *Town and Country Mouse*, a happy parody of Dryden's *Hind and Panther*, not only increased his literary reputation but directly helped him to political influence. In 1688, through the patronage of the earl of Dorset, he entered parliament as member for Maldon, and sat in the convention which resolved that William and Mary should be declared king and queen of England. About this time he married the countess-dowager of Manchester, and it would appear, according to Johnson, that it was still his intention to take orders; but after the coronation he purchased a clerkship to the council. On being introduced by Earl Dorset to King William, after the publication of his poetical *Epistle occasioned by his Majesty's Victory in Ireland*, he was ordered to receive an immediate pension of £500 per annum, until an opportunity should present itself of "making a man of him." In 1691 he was chosen chairman of the committee of the House of Commons appointed to confer with a committee of the Lords in regard to the Bill for regulating trials in cases of

high treason; and he displayed in these conferences such tact and debating power that he was made one of the commissioners of the treasury and called to the privy council. It was during these debates that he had recourse to the peculiar oratorical device of losing his presence of mind, in order to give a practical illustration of the necessity of allowing the privilege of counsel to criminals before a court of justice. But his success as a politician was less due to his oratorical gifts than to his skill in finance, and in this respect he soon began to manifest such brilliant talents as completely eclipsed the painstaking abilities of Godolphin. Indeed it may be affirmed that no other statesman has initiated schemes which have left a more permanent mark on the financial history of England. Although perhaps it was inevitable that England should sooner or later adopt the Continental custom of lightening the annual taxation in times of war by contracting a national debt, the actual introduction of the expedient was due to Montague, who on the 15th December 1692 proposed to raise a million of money by way of loan. Previous to this a Scotchman named William Paterson had submitted to the Government his plan of a national bank, and when in the spring of 1694 the prolonged contest with France had rendered another large loan absolutely necessary, Montague introduced a Bill for the incorporation of the Bank of England. The bill after some opposition passed the House of Lords in May, and immediately after the prorogation of parliament Montague was rewarded by the chancellorship of the exchequer. In the following year he was triumphantly returned for the borough of Westminster to the new parliament, and succeeded in passing his celebrated measure to remedy the depreciation which had taken place in the currency on account of dishonest manipulations. To provide for the expense of recoinage, Montague, instead of reviving the old tax of hearth money, introduced the window tax, and the difficulties caused by the temporary absence of a metallic currency were avoided by the issue for the first time of exchequer bills. His other expedients for meeting the emergencies of the financial crisis were equally successful, and the rapid restoration of public credit secured him a commanding influence both in the House of Commons and at the board of the treasury; but although Godolphin resigned office in October 1696, the king hesitated for some time between Montague and Sir Stephen Fox as his successor, and it was not till 1697 that the former was appointed first lord. In 1698 and 1699 he acted as one of the council of regency during the king's absence from England. When in February of the former year he had been accused of peculation in connexion with the issue of exchequer bills, not only had he been triumphantly acquitted but the House had declared that for his good services to the Government he had deserved his Majesty's favour; and his reputation was still further increased in the same year by the extraordinary popularity of his project for a new East India Company. With the accumulation of his political successes his vanity and arrogance became, however, so offensive that latterly they utterly lost him the influence he had acquired by his administrative ability and his masterly eloquence; and when his power began to be on the wane he set the seal to his political overthrow by conferring the lucrative sinecure office of auditor of the exchequer on his brother in trust for himself should he be compelled to retire from power. For some time after this in attempting to lead the House of Commons he had to submit to constant mortifications, often verging on personal insults, and after the return of the king in 1699 he resigned his offices in the Government and succeeded his brother in the auditorship. On the accession of the Tories to power he was removed in 1701 to the House of Lords by the title of Lord Halifax. In the same year he was impeached for

malpractices along with Lord Somers and the earls of Portland and Orford, but all the charges were dismissed by the Lords; and in 1703 a second attempt to impeach him was still more unsuccessful. He continued out of office during the reign of Queen Anne, but in 1706 he was named one of the commissioners to negotiate the union with Scotland; and after the passing of the Act of Settlement in favour of the house of Hanover, he was appointed ambassador to the elector's court to convey the insignia of order of the garter to George I. On the death of Anne (1714) he was appointed one of the council of regency until the arrival of the king from Hanover; and after the coronation he received the office of first lord of the treasury in the new ministry, being at the same time created Earl of Halifax and Viscount Sunbury. He died on the 15th May of the following year, and left no issue. His nephew succeeded to the barony, and was raised to the earldom; he left it to his son George Dunk, a statesman of some eminence, with whose death without issue in 1771 the Halifax titles became extinct.

Montague's association with Prior in the travesty of Dryden's *Hind and Panther* has no doubt largely aided in preserving his literary reputation; but he is perhaps indebted for it chiefly to his subsequent influential position and to the fulsome flattery of the men of letters who enjoyed his friendship, and who, in return for his liberal donations and the splendid banqueting which they occasionally enjoyed at his villa on the Thames, "fed him," as Pope says, "all day long with dedications." That, however, his beneficence to needy talent, if sometimes attributable to an itching ear for adulation, was at others prompted by a sincere appreciation of intellectual merit, is sufficiently attested by the manner in which he procured from Godolphin a commissionership for Addison, and also by his lifelong intimacy with Newton, for whom he obtained the mastership of the mint. The small fragments of poetry which he left behind him, and which were almost solely the composition of his early years, display a certain facility and vigour of diction, but their thought and fancy are never more than commonplace, and not unfrequently in striving to be eloquent and impressive he is only grotesquely and extravagantly absurd. In administrative talent he was the superior of all his contemporaries, and his only rival in parliamentary eloquence was Somers; but the skill with which he managed measures was superior to his tact in dealing with men, and the effect of his brilliant financial successes on his reputation was gradually almost nullified by the affected arrogance of his manner and by the eccentricities of his sensitive vanity. So eager latterly was his thirst for fame and power that perhaps Marlborough did not exaggerate when he said that "he had no other principle but his ambition, so that he would put all in distraction rather than not gain his point."

Among the numerous notices of Halifax by contemporaries may be mentioned the eulogistic reference which concludes Addison's account of the "greatest of English poets"; the dedications by Steel to the second volume of the *Spectator* and to the fourth of the *Tatler*; Pope's laudatory mention of him in the epilogue to his *Satires* and in the preface to the *Iliad*, and his portrait of him as "Full-blown Buffo" in the *Epistle to Arbuthnot*. Various allusions to him are to be found in Swift's works and in Marlborough's *Letters*. See also Burnet's *History of his Own Times*; *The Parliamentary History*; Howell's *State Trials*; Johnson's *Lives of the Poets*; and Macaulay's *History of England*. His *Miscellaneous Works* were published at London in 1704; his *Life and Miscellaneous Works* in 1715; and his *Poetical Works*, to which also his "Life" is attached, in 1716. His poems were reprinted in the 9th volume of Johnson's *English Poets*.

HALIFAX, GEORGE SAVILE, MARQUIS OF (c. 1630-1695), English statesman and author, son of Sir William Savile, a Yorkshire baronet of ancient family, and of Anne, daughter of the lord-keeper Coventry and sister of the wife of the first earl of Shaftesbury, was born about 1630.

He succeeded to the baronetcy on the death of his father, and, having taken an active part in the Restoration, he was in 1667 created Baron Savile and Viscount Halifax. Subsequently his political conduct gave deep offence to the king, but although, on his being mentioned in 1672 for a seat in the privy council, Charles at first "kicked at the name," the necessities of the political situation induced him to yield to the solicitations of his advisers, whose arguments for the admission of Halifax were based upon "his family, his abilities, his state and credit, as well as talent to ridicule and unravel whatever he was spited at." Already he was known as one of the most brilliant orators in the House of Lords, and although his political opinions seemed to be shifting and uncertain, the fascination of his manner aided his formidable talents in gradually securing him the permanent favour of the king. In June 1672 he was sent to negotiate terms of peace with France, but he was kept in ignorance of the agreement between Charles and Louis in regard to the establishment of popery in England. He strenuously opposed the Test Bill introduced by Lord Danby in 1675, but continued to sit at the council board till the following year when, having provoked Lord Danby by a witticism in reference to his mild manner of refusing a bribe, the latter procured his dismissal. In 1679 he was, however, created an earl, and having become a member of the new council after the fall of Danby, he differed from the earl of Shaftesbury and his other colleagues in reference to the Exclusion Bill, and by an extraordinary manifestation of nearly all the resources of oratory was instrumental in causing its rejection by the Lords. On this account an address was presented by the Commons praying his "dismissal from the king's person and councils for ever," but the king, whose confidence he had now completely won, retained him in the council, and in 1682 he was created a marquis and became lord privy seal. Although, however, chiefly instrumental in securing the duke of York's succession, his proposed limitations of James's authority when the crown should devolve upon him, as well as his subsequent leaning to Whig principles, awakened the duke's settled hostility, and this was further deepened by his exposure of the malversation of the earl of Rochester. After the accession of James he was accordingly removed from the office of privy seal to that of president of the council, a less important position; and when in 1685 he refused to give his vote for the repeal either of the Test Act or of the Habeas Corpus Act, he was dismissed from the cabinet. But though made privy to the negotiations entered into with the prince of Orange, Halifax, notwithstanding his political humiliation, was opposed to armed intervention, and endeavoured to obtain such concessions from the king as would render this unnecessary. Even after the landing of the prince he consented to act as one of the three commissioners appointed to treat with him, and it was only the cowardly and traitorous flight of James that induced him finally to abandon his cause and to take measures for raising William to the throne. In the Convention Parliament he was chosen speaker of the Lords, and strongly opposed the motion for a regency. On the accession of William he was made lord privy seal, but the disasters of the Irish campaign gave such a plausible colour to the arguments of his opponents against his competency, and to their insinuations regarding his political honesty, that, though still retaining the office of privy seal, he in October 1689 ceased to take part in the councils of the king. He succeeded before the committee of the House of Lords in clearing himself from all guilt in connexion with the murder of Russell and Sidney, but shortly afterwards resigned his office. Irritated doubtless by the bitter animosity of the Whigs and by the coldness of William, he now at first joined himself to the opposition, and even went so far

as to hold communications with St Germain; but either because his anger had cooled, or because he had become convinced of the hopelessness of the fortunes of the Stuarts, he gradually veered back to the support of the Government. He died somewhat suddenly, 20th April 1695. He was succeeded by his son William, with whose death in 1699 the title became extinct in his family. A daughter by his second marriage was the mother of the fourth and celebrated earl of Chesterfield; and from his natural son, Henry Carey the dramatist, was descended the celebrated Edmund Kean.

Halifax is portrayed in Dryden's *Absalom and Achitophel* as—

"Jotham of piercing wit and pregnant thought
 'Eudued by nature and by learning taught
 To move assemblies."

Of his speeches not the smallest fragment remains, but it is admitted that his highest efforts far excelled in effect even those of Shaftesbury, who was his only rival. "Old men," says Macaulay, "who lived to admire the eloquence of Pulteney in its meridian and that of Pitt in its splendid dawn, still murmured that they had heard nothing like the great speeches of Lord Halifax on the Exclusion Bill." The key to the greater part of his political conduct is to be found in the pamphlet *On the Character of a Trimmer*, of which he was undoubtedly the author. He was a trimmer, but a trimmer in the best sense of the term; for though not insensible to worldly advantages, and, notwithstanding his philosophical professions, a lover of pomp and external honours, he was remarkably uncontaminated by the political corruption then almost universally prevalent, and was so emancipated both from party prejudice and selfish ambition as to be able generally to guide his political course by a regard to the best interests of the nation. His sudden changes from one side in politics to another, so far from indicating a loose political morality, were in reality due to the very opposite reason; for in times so unsettled violent and dangerous oscillations were apt to result from a tendency to extremes in both parties. But though his peculiar mental constitution enabled him to play a more important and beneficent part in the politics of his time than any of his contemporaries, it unfitted him for achieving success as a minister of the crown, and rendered his political career a seeming failure. His bent was philosophical rather than practical, and, notwithstanding his great prudence and judgment in several important emergencies, he was apt to be timid and indecisive when the chief burden of responsibility rested upon himself. His writings are neither large nor numerous; but their pure, polished, and nervous English, acute reasoning, mature if somewhat worldly wisdom, apt and varied illustration, and clever and genial wit, fairly entitle them to a place among English classics. Privately he was, according to Burnet, "a man of a great and ready wit, full of life and very pleasant, much given to satire." He had the reputation of holding atheistical opinions, but on his deathbed "professed himself a sincere Christian."

He was the author of *The Anatomy of an Equivalent*, printed in the collection of *State Tracts*, vol. ii.; *A Letter to a Dissenter*; an *Essay upon Taxes*; *Advice to a Daughter*; *The Character of a Trimmer*, published anonymously; *Maxims of State applicable to all Times*; *Character of Bishop Burnet*; *A Seasonable Address to both Houses of Parliament*; *Conditions for Choice of Parliament Men*; *A Rough Draught of a New Model at Sea*; *Observations upon the Reigns of Edwards I., II., III., and Richard II.*; and *A Character of King Charles the Second, and Political, Moral, and Miscellaneous Thoughts and Reflections*, first published in 1750. His *Miscellaneous*, consisting of seven of the above pamphlets, appeared in 1700. A notice by the Hon. Hugh F. Elliot of a "New Manuscript of George Savile, first marquis of Halifax," will be found in *Macmillan's Magazine* for October 1877. He also left *Memoirs of his Life*, which were destroyed. See besides the histories of Hume, Fox, Lingard, and Macaulay; Birch's *Lives*; Burnet's *History of his Own Times*; Chesterfield's *Memoirs*; Walpole's *Royal and Noble Authors*; Courtenay's *Life of Sir William Temple*; and Seward's *Anecdotes*, vol. 1.

HALL, a town in northern Tyrol, Austria, government district of Innsbruck, is picturesquely situated between two mountains on the left bank of the Inn, which is navigable there, and on the railway from Rosenheim to Innsbruck, 5 miles east of the latter. It is the seat of a district court, of a board of salt-works, and of a provincial board of mines. The beautiful Gothic parish church, dating from the 13th century, contains an altar-piece by a pupil of Rubens and the copy of a Christ by Albert Dürer. The principal other public buildings are several monasteries, the gymnasium, the deaf and dumb institute, and the lunatic asylum. The prosperity of the town depends chiefly upon its salt-works, which are supplied by pipes from the mines at Salzberg, 9 miles distant; the annual yield of salt is from 15,000 to 16,000 tons. A considerable number of invalids visit the town on account of its salt-water baths. The principal other industries are the manufacture of woollen cloth, thread, paper, and substitutes for coffee. Hall obtained town rights in 1303. It suffered considerably from earthquakes in 1663 and 1670. In 1809 the patriot Speckbacher on three separate occasions succeeded in storming the position of the Bavarians on the bridge which crosses the Inn at this point. The population in 1870 was 5010.

HALL (generally known as Swabian Hall), a town of Württemberg, circle of Jagst, is situated in a deep valley on both sides of the Kocher, and on the railway from Heilbronn to Krailsheim, 35 miles N.E. of Stuttgart. It is surrounded by strong walls, and possesses seven churches, one of them dating from the 15th century and having fine mediæval carving; a town-house, a lyceum, a real-school of the second order, a hospital, and a house of correction. A short distance south from the town is the old castle of Komburg, now used as a garrison for invalid soldiers, with a richly adorned Benedictine church dating from the 12th century. The town is chiefly known for its extensive salt-works, supplied by means of a pipe from Wilhelmglück mine, 5 miles distant. Connected with the salt-works there is a salt-bath and whey-diet establishment. The other industries of the town are cotton-spinning and weaving, and the manufacture of leather, soap, starch, sago, brushes, pencils, machines, carriages, and metal wares. The population in 1875 was 8430.

Hall originally belonged to the counts of Westheim, and later to the Knights Templars. It was made a free imperial city in the 14th century, and was afterwards included in the different leagues of the cities, knights, and counts. In 1802 it came into the possession of Württemberg.

HALL, BASIL (1788-1844), British traveller and miscellaneous writer, was born at Edinburgh, December 31, 1788. His father, Sir James Hall of Dunglass, was author of an essay on *Gothic Architecture*, and contributed to the Royal Society of Edinburgh, of which he for a time was president, several ingenious papers on geology, in support of Hutton's theory as against that of Werner. His mother was Helen, daughter of Dunbar, fourth earl of Selkirk. Basil Hall was educated at the High School of Edinburgh, and in 1802 entered the navy, where he rose to the rank of post-captain in 1817. By observing the ethnological as well as the physical peculiarities of the countries he visited, he collected the materials for a very large number of scientific papers, which he contributed to various journals and encyclopædias. In 1816 he commanded the sloop "Lyra," which accompanied Lord Amherst's embassy to China; and in this vessel he performed the cruise which he describes in the most popular and perhaps the most interesting of his works—*An Account of a Voyage of Discovery to the West Coast of Corea and the Great Loo-choo Island in the Japan Sea* (London, 1818). In 1820 he held a command on the Pacific coast of America, and in 1824 published two volumes of *Extracts from a Journal written on the Coasts of Chili, Peru, and Mexico*

in the years 1820-21-22. Retiring on half-pay in 1824, Hall in 1825 married a daughter of Sir John Hunter, and in her company travelled (1827-28) through the United States. In 1829 he published his *Travels in North America in the years 1827 and 1828*, a book almost as popular as his first, less from its intrinsic merit than from the violence with which it was assailed by the American press for its views of American society. *Schloss Hainfeld, or a Winter in Lower Styria* (1836), is partly a romance, partly a description of a visit paid by the author to the castle of the Countess Purgstall. *Spain and the Seat of War in Spain* appeared in 1837. The *Fragments of Voyages and Travels* (9 vols.) were issued in three detachments between 1831 and 1840. Captain Hall was a fellow of the Royal Societies of London and Edinburgh, and a member of the Astronomical Society of London, and has left a number of scientific and miscellaneous writings besides those mentioned. His last work, a collection of sketches and tales under the name of *Patchwork* (1841), had not been long published before its author was seized with insanity, from which he was only released by his death, in Haslar Hospital, Portsmouth, September 11, 1844.

HALL, CHARLES FRANCIS (1821-1871), an Arctic explorer, was born at Rochester, New Hampshire, United States, in 1821. After following the trade of blacksmith he became a journalist in Cincinnati, but his enthusiasm for Arctic exploration led him in 1859 to volunteer to the American Geographical Society to "go in search of the bones of Franklin." With the proceeds of a subscription he was equipped for his modest expedition, and obtained a passage in May 1860 on board a New London whaling vessel commanded by Captain Buddington, the same who had picked up the English search-ship "Resolute." The whaler having become blocked up with ice, Hall took up his abode with the Eskimo, living with them for two years, adopting their habits and acquiring their language, making special friends of two natives, man and wife, who had been in England and knew something of our language. He wandered about with the Eskimo in the region to the north of Hudson's Bay, acquiring much information, especially about the people. He published an account of his experiences in 1864, under the title of *Arctic Researches, and Life among the Esquimaux*. Having learned little or nothing, however, about the fate of the Franklin expedition, he returned in 1864, remaining among the Eskimo till 1869. Unfortunately the full journal he kept of his five years' wanderings has never been published. The expedition which brought Hall most prominently into notice was fitted out in 1871 in the steamer "Polaris," which was sent out at the expense of the United States Government, its object being to reach the supposed open Polar Sea, and if possible attain the Pole. Hall was in command, while Buddington was sailing master. There was a modest but competent scientific staff, and among the crew were Hall's two old Eskimo friends, who had become devoted to him. On June 29, 1871, the "Polaris" left New York, and making a remarkably rapid passage up Davis Straits and Smith Sound, reached on August 30 the lat. of 82° 16' N., until the last English expedition the highest northern latitude reached of which there is any authentic report. Hall and most of the officers and crew were for proceeding onwards, but they were overruled by Buddington, and went into winter quarters in a sheltered cove on the Greenland coast, named Polaris Bay, in 81° 38' N. On October 24th Hall returned from a successful sledge expedition to the north, and was suddenly seized by an illness of which he died on November 8th. As there were some suspicions of poison, an inquiry was made by the Navy Department, who found that there was no proof of foul play. Captain Buddington, on whom the command devolved, determined

in August of next year to return, but the "Polaris" was greatly hampered by the ice. The danger became so great that on October 15th boats and stores were put on the ice, on which nineteen of the crew had disembarked. Suddenly the ship broke away, and the party on the ice drifted slowly southwards for 195 days, and were picked up off the coast of Labrador, in 53° 35' N., by a whaling steamer 2000 miles from where they had parted with the "Polaris." The party in the ship reached Littleton's Island, where they passed the winter, building two boats from the boards of the vessel, in which they set sail southwards in June 1873. On the 23d of that month they were picked up by a Dundee whaler, and were brought to that town, from which they ultimately reached the United States. The scientific results of the unfortunate Hall's last expedition were of considerable importance, and have been published by the United States Government, as also has an independent account in German by Dr Bessels, one of the scientific staff.

HALL, or HALLE, EDWARD (ob. 1547), an English lawyer who takes high rank among the earlier narrators of his country's history, was born in London about the close of the 15th century and died in 1547, the year of the death of King Henry VIII. Though his name has all the appearance of a purely English word, it is none the less of foreign origin, John Hall of Northall, in Shropshire, our author's father, tracing his lineage back to Frederick of Halle in Tyrol, natural son of Albert of Austria. From Eton Edward Hall passed to Cambridge, and according to some accounts it would appear that at a later date he was also a student at Oxford. Entering Gray's Inn he was duly called to the bar; and we find him afterwards filling the offices of common serjeant, under-sheriff of the city of London, summer reader of Gray's Inn (1533), double reader in Lent (1540), and judge of the sheriff court. The date of the first appearance of his chronicle has been matter of question; but it is generally agreed that there was no such edition as that of 1542 assigned by the older bibliographers to Berthelette. The real *editio princeps* is almost certainly that issued by Grafton in 1548, the year after Hall's death, with a continuation compiled mainly from the author's MSS.; it is remarkable, says Mr Hazlitt (*Collections and Notes*), as having probably more variations in the copies than any book in the language. A reprint was published in 1809 under the supervision of Sir Henry Ellis, who, however, furnished neither introduction nor comment.

Hall's work deserves a higher title than that of chronicle; partly, perhaps, by a happy accident, but partly also by the author's judicious management, it possesses no small unity of theme and construction. Beginning with the famous combat at Coventry between Henry of Hereford and Thomas Mowbray, it follows the tragic progress of the strife between York and Lancaster till it is brought to a close by the marriage of Henry VII. with Margaret of York, and then it shows England united and at rest under Henry VIII. The policy of this monarch is presented under a very favourable light, and in the religious question the author sides emphatically and intolerantly with Protestantism. For all kinds of ceremonial in utterance and action he has all a lawyer's respect, and his pages are often adorned and encumbered with the pageantry and material garniture of his story. In his style he unites the redundant reduplication and painful particularization of his profession with that evident effort after balance of clauses and fanciful and forcible phraseology which not long afterwards resulted in "Euphuism." On the whole the work is not only valuable but attractive. To the historian it furnishes what is evidently the testimony of an eye-witness on several matters of interest which are neglected by other narrators; and to the student of literature it has the exceptional charm of being one of the prime sources of Shakespeare's historical plays. Compare James Gairdner, *Early Chroniclers of Europe: England*, London, 1879.

HALL, JAMES (1793-1868), an American judge and the author of a number of books chiefly relating to the Western States, was born at Philadelphia, August 19, 1793. After for some time prosecuting the study of law, he in 1812 joined the army, and in the war with Great Britain distinguished himself in engagements at Lundy's Lane,

Niagara, and Fort Erie. On the conclusion of the war he accompanied an expedition against Algiers, but in 1818 he resigned his commission, and continued the study of law at Pittsburg. In 1820 he removed to Shawneetown, Illinois, where he commenced practice at the bar and also edited the *Illinois Gazette*. Soon after he was appointed public prosecutor of the circuit, and in 1824 legislature judge. On the abolition of the latter office four years afterwards he was appointed State treasurer, but he continued at the same time his legal practice and also edited the *Illinois Intelligencer*. Subsequently he became editor of the *Western Souvenir*, an annual publication, and of the *Illinois Monthly Magazine*, afterwards the *Western Monthly Magazine*. He died near Cincinnati, July 5, 1868.

The following are his principal works:—*Letters from the West*, originally contributed to the *Portfolio*, and collected and published in London in 1828; *Legends of the West*, 1832; *The Soldier's Bride and other Tales*, 1832; *The Harpe's Head, a Legend of Kentucky*, 1833; *Sketches of the West*, 2 vols., 1835; *Tales of the Border*, 1835; *Notes on the Western States*, 1838; *History of the Indian Tribes*, in conjunction with T. L. McKeeney, 3 vols., 1838-44; *The Wilderness and the War-Path*, 1845; *Romances of Western History*, 1857.

HALL, JOSEPH (1574-1656), bishop of Norwich, one of the wittiest as well as wisest writers of his century, was born at Bristow Park, parish of Ashby-de-la-Zouch, Leicestershire, July 1, 1574. Designed from infancy for the church, he received his early education at the school of his native place, whence in his fifteenth year he passed to Emmanuel College, Cambridge. After being chosen for two years in succession to read the rhetoric lectures in the public schools, Hall became a fellow of his college in 1595, and in the following year received the degree of master of arts. Having taken holy orders, he in 1601 became rector of Halstead in Suffolk, near Bury St Edmunds. Two years later he married; and in 1605 he accompanied Sir Edmund Bacon to the Spanish Netherlands. In 1612 Hall was presented to the curacy of Waltham-Holy-Cross, in Essex, and about the same time received the degree of doctor of divinity. Meanwhile his talents as a preacher, and the ability shown in his controversial writings, had brought him into notice at court. He was appointed chaplain to Prince Henry and prebendary of Wolverhampton. The latter dignity he soon resigned. In 1616 Hall accompanied the earl of Carlisle on his mission to France, but was compelled by illness to return; in 1617 he went with James I. into Scotland, and in 1618 was appointed by him one of the English deputies to the synod at Dort; but he was again forced by sickness to return before the business of the assembly was finished. The year before (1617) he had been appointed dean of Worcester. In the years that followed Hall preached frequently before the court and took an active part in the controversies of the day, especially in that between the Arminian and Calvinistic parties in the Church of England, to the latter of which he belonged. In 1624 he refused the see of Gloucester, but in 1627 became bishop of Exeter. In this position, by his toleration of lecturings and his Calvinistic mode of preaching and administering his diocese, he incurred the suspicion of disaffection to episcopacy, and on three occasions appeared on his knees before the king, to answer for his puritanical practices. Hall felt bitterly these undeserved charges of Laud, and threatened to "cast up his rochel" rather than be subject to them. No better proof of his attachment to the Church of England is needed than his *Episcopacy by Divine Right Asserted*, written in 1640 at the suggestion of Laud. In 1641 Hall was translated to the see of Norwich. The same year he joined eleven other bishops in presenting to parliament a protest against all laws passed in their enforced absence. Upon this the bishops were accused of high treason and thrown into the Tower. Hall in his *Hard Measure* relates the trials he underwent both at this time

and afterwards. The accusation fell to the ground, and in six months the bishops were released (June 1642), only, however, on each finding security for £5000. Hall proceeded to Norwich, which he had not yet visited, and set about his pastoral duties; but in April 1643 his revenues and personal property were sequestered by parliament, a nominal allowance of £400 a year being made for his maintenance. Mrs Hall with great difficulty obtained a fifth of her husband's property. The bishop was next ejected from his palace, and the cathedral was dismantled. Having retired to a small estate at Higham near Norwich, which he had been able to buy, he there, with his books, bought for him by a friend, spent the rest of his life, writing and preaching "till he was first forbidden by men, and at last disabled by God." He died 8th September 1656, in his eighty-third year.

The great bulk of Bishop Hall's writings is controversial, and therefore of comparatively ephemeral interest; but some of them continue to deserve attention. His satires, published under the name of *Virgideiarum Sixe Bookes*, consist of three bookes of *Toothlesse Satyrs*, subdivided into (1) Poetical, (2) Academical, and (3) Morall, published in 1597, and three bookes of *Bytting Satyrs*, published in 1598. They appeared together in 1599. Hall claims to be the first English satirist, though Hallam disputes his title, and at the same time rather disparages the satires, which have on the other hand been very highly praised by Campbell and Warton. In his *Epistles* (1608-11) Hall claims to be the introducer of that style of prose composition also into English; but both Ascham and Howell anticipated him. The *Contemplations upon the Principal Passages of the History of the New Testament* (1612-15), a devout and pious work, one by which perhaps Hall is most generally known, are happily distinguished from most compositions of the class to which they belong by a shy and racy wit which not unfrequently puts the reader in mind of Thomas Fuller. *Mundus Alter et Idem*, a species of allegorical romance, published in 1643, was translated into English by John Healey, under the title of *Discovery of a New World*. Other writings of this "English Seneca," as Sir Henry Wotton called him, are *Explication of Hard Texts* (1633-34), *Christian Meditations* (1640), and *Henoichismus, sive Tractatus de modo ambulandi cum Deo*, translated in 1769. An edition of his works was published in 1808 at London, in 10 vols., by the Rev. Josiah Pratt; and a later and better one, in 12 vols., at Oxford (1837-39), by the Rev. Peter Hall. A life of Bishop Hall by the Rev. John Jones appeared in 1826.

HALL, MARSHALL (1790-1857), the discoverer of the "diastaltic nervous system," was born at Basford, Notts, February 18, 1790. His father, Robert Hall, a cotton manufacturer at that place, is well known as the introducer of the modern processes of bleaching on a large scale. Having attended Blanchard's academy at Nottingham, where Kirke White was educated, Marshall Hall commenced in 1809 his studies for the medical profession at Edinburgh university. In 1811 he was elected senior president of the Royal Medical Society; the following year he took the M.D. degree, and was immediately appointed resident house physician to the Royal Infirmary, Edinburgh. This appointment he resigned after two years, when he visited Paris and its medical schools, and, on a walking tour, those also of Berlin, Göttingen, &c. In 1817, taking up his abode at Nottingham, he published his *Diagnosis*, in which he insisted that, before treatment, the exact nature of a malady should be ascertained. He rapidly acquired an extensive country practice, his improved method in puerperal cases and his disuse of the venesection then popular attracting many patients. In 1818 he wrote the *Mimoses*, a work on the affections denominated bilious, nervous, &c. The next year he was elected a fellow of the Royal Society of Edinburgh, and in 1825 he became physician to the Nottingham general hospital. In 1826 he removed to London, and in the following year he published his *Commentaries* on the more important diseases of females. He pursued his studies of the effects of blood-letting, and his *Researches* (issued in 1830) were acknowledged by the medical profession to be of vast practical value. Much practical good also resulted from his warning against mistaking exhaustion for inflammation. Hall

married in 1829, and the same year he made the discovery which placed him in rank with Harvey. It is described in *A Critical and Experimental Essay on the Circulation of the Blood in the Capillary Vessels*, in which he showed that the blood-channels intermediate between arteries and veins serve the office of bringing the fluid blood into contact with the material tissues of the system. About this time he made his original investigations on quantity of respiration, detailed in *The Inverse Ratio which subsists between the Respiration and Irritability in the Animal Kingdom*, a work which led to the treatises on hibernation. In 1831 he proposed a simple and bloodless operation for the removal of vascular nævus. His most important discovery in physiology was the "diastaltic spinal system," his views being embodied in a paper on *The reflex Function of the Medulla Oblongata and the Medulla Spinalis*, 1832, in which year he was elected fellow of the Royal Society, London. This paper was supplemented in 1837 by another *On the True Spinal Marrow, and the Excito-motor System of Nerves*, in which he explained the real classification and distribution of the entire nervous system. The "reflex function" excited great attention in Germany and Holland, and M. Flourens described it as "a great epoch in physiology." Hall thus became the authority on the multiform deranged states of health referable to an abnormal condition of the nervous system, and he made plain the obscure class of convulsive affections. The action of strychnia as a spinal tonic or excitant, the relief of the epileptic, tracheotomy in laryngismal epilepsy, and the "ready method" in asphyxia, were among the later objects of his investigation. His "ready method"—sometimes called Marshall Hall's method—for resuscitation in drowning and other forms of suspended respiration—is perhaps the most popular of his discoveries; by it innumerable lives have been preserved. Dr Hall lectured at various medical schools, at the college of physicians, and also at New York during his American tour. His papers in medical and scientific journals, including the *Comptes Rendus*, are remarkable for lucidity and brevity. He died at Brighton of a throat affection, aggravated by lecturing, August 11, 1857. A list of his works, most of which have been translated into foreign languages, and details of his "ready method," &c., are given in his *Memoirs* by his widow, London, 1861.

HALL, ROBERT (1764-1831), one of the greatest of English pulpit orators, was born May 2, 1764, at Arnsby near Leicester, where his father, a man whose cast of mind in some respects resembled closely that of the son, was pastor of a Baptist congregation. Robert was the youngest of a family of fourteen. In infancy his physical powers were so feeble that until two years of age he was unable to walk, and, although his expression and gestures indicated great mental vivacity, he was equally slow to acquire the faculty of articulate speech. It even appears that he had learned to read before he was able to imitate spoken sounds, his nurse having taught him the letters of the alphabet and the formation of words from the inscriptions on the tombstones of a churchyard adjoining his father's dwelling-house. When once the interest in this exercise had loosened his reluctant tongue his progress was remarkably rapid, and before he had attained his third year the fluency of his talk gave some indications of his future oratorical eminence. While still at the dame's school his passion for books absorbed the greater part of his time, and in the summer it was his custom after school hours to retire to the churchyard with a volume which he continued to peruse there till nightfall, making out the meaning of the more difficult words with the help of a pocket dictionary. From his sixth to his eleventh year he attended the school of Mr Simmons at Wigston, a village 4 miles from Arasby.

There his precocity assumed the exceptional form of an intense interest in metaphysics, partly perhaps on account of the restricted character of his father's library; and before he was nine years of age he had read and re-read Jonathan Edwards's *Treatise on the Will* and Butler's *Analogy*. This incessant study at such an early period of life seems, however, to have had an injurious influence on his health, and may have been partly the cause of the disease from which he experienced such suffering in after life, and symptoms of whose existence began at this time to manifest themselves. Occasionally he was already troubled with intense pain in the back, and after he left Mr Simmons's school his appearance was so sickly as to awaken fears of the presence of consumption. In order therefore to obtain the benefit of a change of air, he stayed for some time in the house of a gentleman near Kettering, who with an impropriety which Hall himself afterwards referred to as "egregious," prevailed upon the boy of eleven to give occasional addresses at prayer meetings. As his health seemed rapidly to recover, he was sent to a school at Northampton conducted by the Rev. John Ryland, where he remained a year and a half, and "made great progress in Latin and Greek." On leaving school he for some time studied divinity under the direction of his father, and in October 1778 he entered the Bristol academy for the preparation of students for the Baptist ministry. Here the self-possession which had enabled him in his twelfth year to address unfalteringly various audiences of grown-up people seems to have strangely forsaken him; for when, in accordance with the arrangements of the academy, his turn came to deliver an address in the vestry of Broadmead Chapel, he broke down on two separate occasions and was unable to finish his discourse. On the 13th August 1780 he was set apart to the ministry, but he still continued his studies at the academy; and in 1781, in accordance with the provisions of an exhibition which he held, he entered King's College, Aberdeen, where he took the degree of master of arts in March 1785. At the university he was without a rival of his own standing in any of the classes, distinguishing himself alike in classics, philosophy, and mathematics. He there formed the acquaintance of Mackintosh (afterwards Sir James), who, though a year his junior in age, was a year his senior as a student, and who became attached to him "because he could not help it." While they remained at Aberdeen the two were inseparable, reading together the best Greek authors, especially Plato, and discussing, either during their walks by the sea-shore and the banks of the Don or in their rooms until early morning, the most perplexed questions in philosophy and religion. The interest of their conversation seems to have lain more in the difference than the agreement of their opinions; but their controversies, so far from causing any even temporary estrangement, tended only to cement more closely their friendship and to deepen in each the respect for the mental and moral qualities of the other.

During the vacation between his last two sessions at Aberdeen, Hall acted as assistant pastor to Dr Evans at Broadmead Chapel, Bristol, and three months after leaving the university he was appointed classical tutor in the Bristol academy, an office which he held for more than five years. Even at this period his extraordinary eloquence had excited an interest beyond the bounds of the denomination to which he belonged, and when he preached the chapel was generally crowded to excess, the audience including many persons of intellectual tastes. It would appear, however, that, in the case of Mr Fuller, Dr Ryland, and other theological authorities, his exuberant intellectual energy and his outspoken expression of tolerance for certain aspects of Socinianism caused trembling to be greatly mingled with their admiration; and ultimately, suspicions in regard

to his orthodoxy having in 1789 led to a misunderstanding with his colleague and a part of the congregation, he in July 1790 accepted an invitation to make trial of a congregation at Cambridge, of which he became pastor in July of the following year. From a statement of his opinions contained in a letter to the congregation which he left, it would appear that, while a firm believer in the proper divinity of Christ, he had at this time disowned the cardinal principles of Calvinism—the federal headship of Adam, and the doctrine of absolute election and reprobation; and that he was so far a materialist as to "hold that man's thinking powers and faculties are the result of a certain organization of matter, and that after death he ceases to be conscious till the resurrection." It was during his Cambridge ministry, which extended over a period of fifteen years, that his oratory was most brilliant and most immediately powerful. At Cambridge the intellectual character of a large part of the audience supplied a stimulus which was wanting at Leicester and Bristol, but besides this his physical powers were then at their best, and were still unaffected by the constant pain which already so severely tested his powers of endurance and rendered the discharge of his duties such a marvellous triumph of will. Above all it was not till near the close of this period that his intellectual pathway was crossed by the shadow of mental derangement, and an element of weakness and uncertainty introduced into his career which for some time clouded the horizon of his hopes and perhaps placed a permanent check on his highest form of intellectual enterprise. While at Cambridge he gave to the world some of the more important of the few and small publications which, although those who were his constant hearers have affirmed that several of his imperfectly reported sermons convey a juster impression of the usual character of his oratory, are the only correct and properly authenticated records of his style of thought and composition. His first published compositions had a political origin. In 1791 appeared *Christianity consistent with the Love of Freedom*, in which he defused the political conduct of dissenters against the attacks of the Rev. John Clayton, minister of Weighhouse, and gave eloquent expression to his hopes of great political and social ameliorations as destined to result nearly or remotely from the subversion of old ideas and institutions in the maelstrom of the French Revolution. In 1793 he expounded his political sentiments in a powerful and more extended pamphlet entitled an *Apology for the Freedom of the Press*, which at once obtained an extensive circulation, and doubtless to some extent aided in the formation of that public opinion which has given birth in England to the present remarkable era of gradual and unswerving political progress. On account, however, of certain asperities into which the warmth of his feelings had betrayed him, and his conviction that he had treated his subject in too superficial a manner, he refused to permit the publication of the pamphlet beyond the third edition, until the references of political opponents and the circulation of copies without his sanction induced him in 1821 to prepare a new edition, from which he omitted the attack on Bishop Horsley, and to which he prefixed an advertisement stating that his political opinions had undergone no substantial change. His other publications while at Cambridge were three sermons—*On Modern Infidelity* (1801), *Reflections on War* (1802), and *Sentiments proper to the present Crisis* (1803). From his first attack of insanity, which occurred in November 1804, he recovered so speedily that he was able to resume his duties in April 1805, but a more severe recurrence of the malady rendered it advisable for him on his second recovery to resign his pastoral office, which he did in March 1806. On leaving Cambridge he paid a visit to his relatives in Leicestershire, and then for some time resided at Enderby, preaching occasionally in some of

the neighbouring villages. Latterly he ministered to a small congregation in Harvey Lane, Leicester, from whom at the close of 1806 he accepted a call to be their stated pastor. In the autumn of 1807 he changed his residence from Enderby to Leicester, and in 1808 he married the servant of a brother minister. His proposal of marriage had been made after an almost momentary acquaintance, and, according to the traditional account, in very abrupt and peculiar terms; but, judging from his subsequent domestic life, his choice did sufficient credit to his penetration and sagacity. His writings at Leicester embraced various tracts printed for private circulation; a number of contributions to the *Eclectic Review*, among which may be mentioned his articles on "Foster's Essays" and on "Zeal without Innovation"; several sermons, including those *On the Advantages of Knowledge to the Lower Classes* (1810), *On the Death of the Princess Charlotte* (1817), and *On the Death of Dr Ryland* (1825); and his pamphlet on *Terms of Communion*, in which he advocated intercommunion with all those who acknowledged the "essentials" of Christianity. In 1819 he published an edition in one volume of his sermons formerly printed. On the death of Dr Ryland, Hall was invited to return to the pastorate of Broadmead Chapel, Bristol, and as the peace of the congregation at Leicester had been to some degree disturbed by a controversy regarding several cases of discipline, he resolved to accept the invitation, and removed there in April 1826. About this period the malady—renal calculus—which had for many years rendered his life an almost continual martyrdom, and whose influence he had triumphed over with such marvellous fortitude, began to show signs of indirectly obtaining the mastery over his vigorous constitution; and henceforth increasing infirmities and sufferings, which rest and change of scene could do little to alleviate, surrounded with deepening external gloom the spirit whose cheerfulness and peace they seemed to leave almost totally uninjured. Gradually the inability to take proper exercise, by inducing a plethoric habit of body and impeding the circulation, led to a diseased condition of the heart, which resulted in his death, February 21, 1831.

The private manners of Hall were remarkably simple and unaffected; and if his method of expressing his opinions was frequently impetuous, and occasionally somewhat brusque and imperious, this was owing rather to his constitutional energy and straightforward impulsive honesty than to an overbearing and dogmatic temper. Though exercising his sarcastic powers with great unconstraint, he reserved his severity chiefly for errors which implied some kind of moral culpability, and he was always careful to be respectful to true worth even when concealed or deformed by many superficial defects, or conjoined with humble rank or weak mental capacity. In reality few were more unassuming or unselfish or more continuously actuated by feelings truly charitable and benevolent. His mental absorption led to the contraction of many minor eccentricities, one of which was a frequent obliviousness to the flight of time and a consequent inability to remember his engagements. Towards the close of his Cambridge ministry he acquired the habit of smoking, and from that time his pipe was his almost constant companion and one of his principal solaces in his bodily suffering. Indeed talk and tobacco may be said to have supplied his chief means of recreation. In his conversation the calibre and idiosyncrasies of his genius were better displayed than in any of the writings he has left us; and it is said to have exercised an even more captivating charm than did his finest orations. Its most striking characteristics were keen, biting, and original wit, and wild and daring imaginative flights.

Both physically and mentally Hall possessed a rare combination of qualities fitting him to excel as a public speaker. He did not attain success without effort and discipline, but the

faults which hampered his capabilities were not of a formidable character. He was of powerful and athletic build, and his great breadth of chest, while it lent an impression of massiveness to his bearing, indicated abundant capacity to sustain the kind of physical exertion which oratory entails. His voice was deficient in strength and volume, but exceptionally pure and melodious, and capable of being thoroughly interpenetrated by emotion. Its inadequacy in tone was also compensated for by its great flexibility, which enabled him by the momentum of rapid utterance to obtain all the vocal force necessary to the highest oratorical effects. According to Foster, his countenance "was formed as if on purpose for the most declared manifestation of power." The forehead was high and sloping, with well-arched brows, beneath which his dark and brilliant eye, in his more excited moments, burned and glowed with thought and passion. The lower part of his countenance indicated a vehement and headstrong temperament under the control of an iron will—doubtless powerfully reinforced by the strong moral sensibility which gave a peculiar elevation and dignity to features possessing no trait of grace or beauty. Perhaps the "stern, intense, and somewhat formidable expression," which Foster referred to as wanting in the portrait accompanying his works, had its origin partly in his constant suffering.

His gestures in speaking were few and simple, and his manner seemed to be naturally determined by his mental emotions without conscious purpose on his part. He gave the impression of thorough self-forgetfulness and absorption in his subject, and during the latter part of an oration of being wholly possessed and dominated by the thoughts and sentiments which he uttered. It is generally affirmed that in his spoken sermons his style was more easy, graceful, and various than in any of the sermons which he prepared for the press. In the latter the structure of the sentences is often formal and laboured, the rhythm artificial and monotonous; and idiomatic vigour is in some degree sacrificed to elegance and pomp. In the higher flights of his eloquence his language was, however, unsurpassed for purity and happy adaptation to the thought. Indeed one of his most remarkable gifts is said to have been his extemporaneous command of a clear and felicitous vocabulary, which seemed to clothe every shade of his meaning with its appropriate expression, and whose musical cadences formed a not unimportant element in the fascination exercised by his oratory. It is true that in many cases his language had before he spoke undergone considerable mental elaboration, but he was nevertheless so little enslaved to his memory that, according to his own statement, he never entered the pulpit without omitting something which he wished to say and saying something which he wished to omit. In preaching his severe taste and deep sense of solemnity restrained every tendency to eccentricity or extravagance, and he never permitted his brilliant wit to emit even the faintest and most momentary sparkle. It may therefore be believed that on a secular platform his oratory would have been more racy and natural, and from the scope afforded for the free exercise of all his powers would have attained to a more varied perfection. In his occasional reviews his style is clear and pointed, but apart from this it is his sarcasm that chiefly conveys the impression of more than average ability. The predominant element of his eloquence was reasoning. His statements and propositions were animated with passion and illuminated by a vivid and rich if not strikingly powerful and original imagination; but in no instance did passion or imagination seem to obtain the chief sway. It was generally not till towards the close of his sermon that the spell of his eloquence asserted its highest influence over his audience. Then the various trains of thought through which he had been

guiding them seemed to meet in an intense focus where reason, imagination, and passion were blended together, and in whose light the theme he had been expounding stood revealed in such vivid truth and beauty as to captivate for the moment every heart. But though stating truth chiefly in the form of reasoning, he constantly exhibited it rather in its moral than in its theological aspects. His eloquence was indeed morally more than intellectually powerful; and its moral purpose was besides achieved not so much by the direct inculcation of moral duties, or the detection and exposure of moral deformities, as by his unconscious exhibition of his own moral elevation and of the ardour and purity of his hopes and aims. Indeed in many of his sermons both the form and matter of his thought seemed to be determined rather by his own individual interest in his subject than by the consideration of the capacities and wants of his hearers. Though exhibiting a catholicity of spirit much in advance of his time, the range of his thought is completely included within the limits of traditional opinion. In treating of what he regarded as the cardinal truths of religion he is of course oratorically effective, but the dexterous and brilliant manner in which he wields the old controversial weapons does not compensate for their inherent inadequacy. He indulges too frequently in innuendoes against the moral character and motives of his opponents, and fails to sound the full depth of the speculative problems upon which he attempts to dogmatize. His sermons will always be esteemed by the student of English literature for their many passages of splendid and finished eloquence, but his theological writings as a whole are of course without that quaint interest attaching to representations of truth which though now old and effete originally exhibited it with the freshness and vividness of a discovery; while on the other hand they have no sufficient colouring from modern tendencies to give to them a more than superficial value in relation to those phases of religious thought which are predominant at the present time.

HALLA. See HALA.

HALLAM, HENRY, the celebrated English historian, was born at Windsor in the year 1777,—some authorities make the date one year later,—and he died at Pickhurst, Kent, on the 21st of January 1859. Notwithstanding his great fame and recent death very little seems to be known of the personal history of Hallam. He was the son of a dean of Bristol, and was educated at Eton, and afterwards went to Christ Church, Oxford, where he took his degree in 1799. He was called to the bar by the Inner Temple, and afterwards became a bencher of that society, but he does not appear to have at any time attempted to obtain practice. Early in life he devoted himself to literary work, and became connected with the brilliant band of authors and politicians who then led the Whig party. A commissionership of audits, obtained through that connexion, together with some private means, made him independent in point of worldly fortune, and enabled him to devote himself entirely to the studies of his life. He took no active part in practical politics, and was in fact unsuited by nature for the rough work of party polemics. But he was an active supporter of many popular movements—particularly of that which ended in the abolition of the slave trade; and he was throughout his entire life sincerely and profoundly attached to the political principles of the

Whigs, both in their popular and in their aristocratic aspect. Hallam's earliest literary work was undertaken in connexion with the great organ of the Whig party, the *Edinburgh Review*, where his review of Scott's *Dryden* attracted much notice. His first great work, *The View of the State of Europe during the Middle Ages*, was produced in 1818, and was followed nine years later by the *Constitutional History of England*. In 1837 appeared the *Introduction to the Literature of Europe in the 15th, 16th, and 17th Centuries*. These are the three works on which the fame of Hallam rests. They at once took a place in English literature which has never been seriously challenged. A volume of supplemental notes to his *Middle Ages* was published in 1848. These facts and dates represent nearly all the events of Hallam's career. The strongest personal interest in his life was the affliction which befell him in the loss of all his family, one after another. His eldest son, Arthur Henry Hallam,—the "A. H. H." of Tennyson's *In Memoriam*, and by the testimony of his contemporaries a man of the most brilliant promise,—died in 1833 at the age of twenty-two. Seventeen years later, his second son, Henry Fitzmaurice Hallam, was cut off like his brother at the very threshold of what might have been a great career. The premature death and high talents of these young men, and the association of one of them with the most popular poem of the age, have made Hallam's family afflictions better known than any other incidents of his life. He survived wife, daughter, and sons by many years. In 1834 Hallam published *The Remains in Prose and Verse of Arthur Henry Hallam, with a Sketch of his Life*. In 1852 a selection of *Literary Essays and Characters from the Literature of Europe* was published. Hallam was a fellow of the Royal Society, and a trustee of the British Museum, and enjoyed many other appropriate distinctions. In 1830 he received the gold medal for history, founded by George III.

The *Middle Ages* is described by Hallam himself as a series of historical dissertations, a comprehensive survey of the chief circumstances that can interest a philosophical inquirer during the period from the 5th to the 15th century. The work consists of nine long chapters, each of which is a complete treatise in itself. The history of France, of Italy, of Spain, of Germany, and of the Greek and Saracenic empires, sketched in rapid and general terms, is the subject of five separate chapters. Others deal with the great institutional features of mediæval society—the development of the feudal system, of the ecclesiastical system, and of the free political system of England. The last chapter sketches the general state of society, the growth of commerce, manners, and literature in the Middle Ages. The book may be regarded as a general view of early modern history, preparatory to the more detailed treatment of special lines of inquiry carried out in his subsequent works, although Hallam's original intention was to continue the work on the scale on which it had been begun.

The *Constitutional History of England* takes up the subject at the point at which it had been dropped in the *View of the Middle Ages*, viz., the accession of Henry VII.,¹ and carries it down to the accession of George III. Hallam stopped here for a characteristic reason, which it is impossible not to respect and to regret. He was unwilling to excite the prejudices of modern politics which seemed to him to run back through the whole period of the reign of George III. As a matter of fact they ran back much further, as Hallam soon found. The sensitive impartiality which withheld him from touching perhaps the most interesting period in the history of the constitution did not save him from the charge of partisanship. The *Quarterly*

¹ Lord Brougham, overlooking the constitutional chapter in the *Middle Ages*, censured Hallam for making an arbitrary beginning at this point, and proposed to write a more complete history himself.

Review for 1828 contains an article on the *Constitutional History*, written by Soutley, full of railing and reproach. The work, he says, is the "production of a decided partisan," who "rakes in the ashes of long-forgotten and a thousand times buried slanders, for the means of heaping obloquy on all who supported the established institutions of the country." No accusation made by a critic ever fell so wide of the mark. Absolute justice is the standard which Hallam set himself and maintained. His view of constitutional history was that it should contain only so much of the political and general history of the time as bears directly on specific changes in the organization of the state, including therein judicial as well as ecclesiastical institutions. But while abstaining from irrelevant historical discussions, Hallam dealt with statesmen and policies with the calm and fearless impartiality of a judge. It was his cool treatment of such sanctified names as Charles, Cranmer, and Laud that provoked the indignation of Soutbey and the *Quarterly*, who forgot that the same impartial measure was extended to statesmen on the other side. If Hallam can ever be said to have deviated from perfect fairness, it was in the tacit assumption that the 19th century theory of the constitution was the right theory in previous centuries, and that those who departed from it on one side or the other were in the wrong. He did unconsciously antedate the constitution, and it is clear from incidental allusions in his last work that he did not regard with favour the democratic changes which he thought to be impending. Hallam, like Macaulay, ultimately referred all political questions to the standard of Whig constitutionalism. This prepossession may be connected with the legal tone that runs through all his political writings. The spirit of the English lawyer is as strong in Hallam as in Bentham, who, like him, was never a practising lawyer. It is no doubt owing to this quality that the *Constitutional History* has become one of the text-books of English politics. Hallam, like Blackstone, has become an authority to whom men of all parties appeal. The origin of English institutions has since been explored with greater elaborateness by Professor Stubbs, but our leading guide to the constitution in its maturity is still Hallam.

Like the *Constitutional History*, the *Introduction to the Literature of Europe* continues one of the branches of inquiry which had been opened in the *View of the Middle Ages*. In the first chapter of the *Literature*, which is to a great extent supplementary to the last chapter of the *Middle Ages*, Hallam sketches the state of literature in Europe down to the end of the 14th century:—the extinction of ancient learning which followed the fall of the Roman empire and the rise of Christianity; the preservation of the Latin language in the services of the church; and the slow revival of letters, which began to show itself soon after the 7th century—"the nadir of the human mind"—had been passed. For the first century and a half of his special period he is mainly occupied with a review of classical learning, and he adopts the plan of taking short decennial periods and noticing the most remarkable works which they produced. The rapid growth of literature in the 16th century compels him to resort to a classification of subjects. Thus in the period 1520–1550 we have separate chapters on ancient literature, theology, speculative philosophy and jurisprudence, the literature of taste, and scientific and miscellaneous literature; and the subdivision of subjects is carried further of course in the later periods. Thus poetry, the drama, and polite literature form the subjects of separate chapters. One inconvenient result of this arrangement is that the same author is scattered over many chapters, according as his works fall within this category or that period of time. Names like Shakespeare, Grotius, Bacon, Hobbes, appear in half a dozen different

places. The individuality of great authors is thus dissipated except when it has been preserved by an occasional sacrifice of the arrangement—and this defect, if it is to be esteemed a defect, is increased by the very sparing references to personal history and character with which Hallam was obliged to content himself. His plan excluded biographical history, nor is the work, he tells us, to be regarded as one of reference. It is rigidly an account of the books which would make a complete library of the period,¹ arranged according to the date of their publication and the nature of their subjects. The history of institutions like universities and academies, and that of great popular movements like the Reformation, are of course noticed in their immediate connexion with literary results; but Hallam had little taste for the spacious generalization which such subjects suggest. The great qualities displayed in this work have been universally acknowledged—conscientiousness, accuracy, judgment, and enormous reading. Not the least striking testimony to Hallam's powers is his mastery over so many diverse forms of intellectual activity. In science and theology, mathematics and poetry, metaphysics and law, he is a competent and always a fair if not a profound critic. The bent of his own mind is manifest in his treatment of pure literature and of political speculation,—which seems to be inspired with stronger personal interest and a higher sense of power than other parts of his work display. Not less worthy of notice in a literary history is the good sense by which both his learning and his tastes have been held in control. Probably no writer ever possessed a juster view of the relative importance of men and things. The labour devoted to an investigation is with Hallam no excuse for dwelling on the result, unless that is in itself important. He turns away contemptuously from the mere curiosities of literature, and is never tempted to make a display of trivial erudition. Nor do we find that his interest in special studies leads him to assign them a disproportionate place in his general view of the literature of a period.

Hallam is generally described as a "philosophical historian." The description is justified not so much by any philosophical quality in his method as by the nature of his subject and his own temper. Hallam is a philosopher to this extent that both in political and in literary history he fixed his attention on results rather than on persons. His conception of history embraced the whole movement of society. Beside that conception the issue of battles and the fate of kings fall into comparative insignificance. "We can trace the pedigree of princes," he reflects, "fill up the catalogue of towns besieged and provinces desolated, describe even the whole pageantry of coronations and festivals, but we cannot recover the genuine history of mankind." But, on the other hand, there is no trace in Hallam of anything like a philosophy of history or society. Wise and generally melancholy reflexions on human nature and political society are not infrequent in his writings, and they arise naturally and incidentally out of the subject he is discussing. His object is the attainment of truth in matters of fact. Sweeping theories of the movement of society, and broad characterizations of particular periods of history, seem to have no attraction for him. The view of mankind on which such generalizations are usually based, taking little account of individual character, was highly distasteful to him. Thus he objects to the use of statistics because they favour that tendency to regard all men as mentally and morally equal which is so unhappily strong in modern times. At the same time Hallam by no means assumes the tone of the mere scholar. He is even solicitous to show that his point of view is that of the cultivated gentleman and not of the specialist of any order. Thus

¹ Technical subjects like painting or English law have been excluded by Hallam, and history and theology only partially treated.

us tells us that Montaigne is the first French author whom an English gentleman is ashamed not to have read. In fact, allusions to the necessary studies of a gentleman meet us constantly, reminding us of the unlikely erudition of the schoolboy in Macaulay. Hallam's prejudices, so far as he had any, belong to the same character. His criticism is apt to assume a tone of moral censure when he has to deal with certain extremes of human thought,—scepticism in philosophy, atheism in religion, and democracy in politics.

Hallam's style is singularly uniform throughout all his writings. It is sincere and straightforward, and obviously innocent of any motive beyond that of clearly expressing the writer's meaning. In the *Literature of Europe* there are many passages of great imaginative beauty. (E. R.)

HALLE (formerly called, to distinguish it from other towns of the same name, Halle in Sachsen, but now generally known as Halle an der Saale), a city of Prussian Saxony, government district of Merseburg, is situated on the right bank of the Saale and at the junction of six railways, 20 miles N.W. of Leipsic. It consists of the old town, or Halle proper, with five suburbs, and the two small towns of Glauchau and Neumarkt, which were added to it in 1817. Halle is under the immediate jurisdiction of the crown, and is the seat of the imperial chief office of mines for

the provinces of Saxony, Brandenburg, and Pomerania, of a head tax-office, of a circle court, and of a provincial office. The greater part of the town is irregularly built, and presents a somewhat unattractive appearance to the eye of a stranger; but of late years it has been much improved by the construction of new promenades on the site of the old fortifications, and by the repaving of many of the streets and the addition of new buildings. Its well-known university was founded by King Frederick I. in 1694 in behalf of the jurist Thomasius, whom many students followed to Halle when he was expelled from Leipsic through the animosity of his fellow professors. It was closed by Napoleon in 1806, and again in 1813; and in 1815 it was united

with that of Wittenberg. It has faculties of theology, law, medicine, and philosophy. From the beginning it has been recognized as one of the principal schools of Protestant theology, and has numbered among its professors some of the most eminent names of Germany. Its maximum number of students occurred in 1829 when they exceeded 1300. Subsequently the number declined below 600, but at present the average attendance is between 900 and 1000. The present buildings were erected in 1834. In connexion with the university there are a botanical garden, a theological and normal seminary, a medical and surgical clinical institute, a maternity hospital, an observatory, and a library of over 100,000 volumes, which also contains collections of coins and engravings. The *Francke'sche Stiftungen*—founded in 1691 by August Hermann Francke, a bronze statue of whom by Rauch was erected in 1829 in the inner court of the building—embrace an orphanage, a laboratory where medicines are prepared and distributed, a Bible press from which Bibles are issued at a cheap rate, and a number of schools of various grades, viz., a Latin school, a higher real-school, a citizen school, a higher female school, and a free school, attended in all by over 3000 pupils. The principal other institutions are the city gymnasium, the provincial trade school, the provincial lunatic asylum, the penitentiary, the town hospital and infirmary, and the deaf and dumb institute. Among the other public buildings may be mentioned the church of St Mary, containing some fine paintings, an interesting Gothic structure of the 16th century, with four towers, two of which are connected by a bridge; the church of St Maurice, dating from the 12th century, with interesting wood-carvings and sculptures; the church of St Ulrich, dating from the 14th century; the cathedral, founded in the 16th century, and containing an altar-piece representing Duke Augustus of Saxony and his family; the red clock tower in the market-place, 276 feet in height; the old town-house; the ruins of the castle of Moritzburg, erected in 1484, formerly the residence of the archbishops of Magdeburg, but destroyed by fire during the Thirty Years' War, with the exception of the left wing, which is now used for military purposes; the lodge of the Freemasons; and the theatre. In 1859 a bronze statue was erected in the market-place to Handel, who was born at Halle in 1685; and in the outskirts of the town there is a monument to the Germans who fell at the battle of Leipsic in 1813. The salt-springs of Halle have been known from a very early period. Some rise within the town and others on an island in the Saale; and together their annual yield of salt is about 12,000 tons. The workmen employed in connexion with the manufacture are a peculiar and distinct race known by the name of *Halloren*, probably descended from an old Frankish colony. They observe several ancient customs, and enjoy certain special exemptions and privileges.

The principal other industries of Halle are the manufacture of starch, beetroot-sugar, chemicals, lignite, candles, pottery-ware, sausages, oil, machines and waggons, sugar-refining, brewing, printing, and bookbinding. Considerable trade, especially in corn, is now carried on by means of the railways, but the shipping trade is unimportant. The population has increased with great rapidity during the last quarter of a century, for while the numbers in 1831 were 25,594, they had risen in 1849 to 33,848 and in 1875 to 60,503.

Halle was first mentioned in 806 as the fortress of Halla erected by Charlemagne. The place was, however, in existence before the Christian era, and owes its origin as well as its name to its salt-springs. Otto the Great presented it in 965 along with the salt-springs to the bishopric of Magdeburg, and in 981 Otto II. raised it to the rank of a town. At the beginning of the 12th century it had attained considerable importance, and in the 13th and 14th centuries as a member of the Hanseatic League it carried on successful wars with the archbishops of Magdeburg; and in 1435 it resisted an army of 30,000 men under the elector of Saxony. On account, however, of internal feuds between the democracy and the patricians it

was subdued in 1478 by Archbishop Ernest, who in order to hold it in check built the castle of Moritzburg. Notwithstanding the efforts of the archbishops of Mainz and Magdeburg, the Reformation found an entrance into the city in 1522; and in 1541 a Lutheran superintendent was appointed. After the peace of Westphalia in 1648 the city came into the possession of the house of Brandenburg. In 1806 it was stormed and taken by the French, after which, at the peace of Tilsit, it was united to the new kingdom of Westphalia. After the battle between the Prussians and French, May 2, 1813, it was taken by the Prussians. The rise of Leipsic was for a long time hurtful to the prosperity of Halle, and its present rapid increase in population and trade is principally due to its position as the centre of a network of railways.

HALLECK, FITZGREENE (1790-1867), an American poet, was born at Guildford, Connecticut, July 8, 1790. By his mother he was descended from John Eliot, the "Apostle of the Indians." At an early age he became clerk in a store at Guildford, and at eighteen he entered a banking-house in New York. Having made the acquaintance of Joseph Rodman Drake in 1819, he assisted him under the signature of "Croaker junior" in contributing to the *New York Evening Post* the humorous series of "Croaker Papers." In 1821 he published his longest poem, *Fanny*, a satire on local politics and fashions in the measure of Byron's *Don Juan*. He visited Europe in 1822-23, and after his return published anonymously in 1827 a volume of poems in which were included "Alnwick Castle" and "Burns." From 1824 to 1849 he was confidential agent of John Jacob Astor, who named him one of the trustees of the Astor Library, and left him an annuity of 200 dollars, on which he retired to Guildford, where he lived with an unmarried sister. In 1864 he published in the *New York Ledger* a poem of 300 lines entitled "Young America." He died at Guildford, November 19, 1867. The poems of Halleck are written with great care and finish, and manifest the possession of a fine sense of harmony and of genial and elevated sentiments.

Editions of his poems appeared in 1836, 1842, 1849, 1858, and 1860. He is also the author of an edition of *Byron* with notes and a memoir, and of two volumes of *Selections from the British Poets*. His *Life*, by J. G. Wilson, appeared in 1869.

HALLECK, HENRY WAGER (1815-1872), an American general, was born at Waterville, Oneida county, New York, January 15, 1815. After studying a short time at Union College, he in 1835 entered the West Point military academy, whence he was in 1839 promoted to the army as second lieutenant in the corps of engineers, being at the same time appointed assistant professor of engineering at the academy. In the following year he was made an assistant to the board of engineers at Washington, and from 1841 to 1844 he was employed in connexion with the fortification of New York harbour. In 1845 he was sent by the Government to examine the principal military establishments of Europe, and during his absence he was promoted to the rank of first lieutenant. After his return he in the winter of 1845-46 delivered at the Lowell Institute, Boston, a course of twelve lectures on the science of war, published in 1846 under the title *Elements of Military Art and Science*, and republished with additions in 1861. On the outbreak of the Mexican war in 1846 he as military engineer accompanied the expedition to California and the Pacific coast, where he distinguished himself not only as an engineer but by his administrative skill as secretary of state, and by his presence of mind and bravery in several skirmishes with the enemy. In 1847 his services were

recognized by promotion to the rank of captain. He continued for several years to act on the staff of General Riley in California, holding at the same time the office of secretary of state of the province; and he took a leading part in framing the State constitution of California, on its being admitted into the Union. In 1852 he was appointed inspector and engineer of lighthouses, and in 1853 he was promoted captain of engineers. He, however, in 1854 resigned his commission in order to devote his chief attention to the practice of law, which he had already for some time carried on; and so great was his success in his profession that the firm of which he was senior partner soon obtained one of the largest legal businesses in the State. He was also from 1850 director of the New Almaden quicksilver mine, and in 1855 he became president of the Pacific and Atlantic Railroad from San Francisco to San José. On the outbreak of the civil war he was in August 1861 appointed major-general of the United States army, and in the following November was appointed commander of the western department, where he conducted the campaign with great energy and with such uniform success against the Confederates that in 1862 they evacuated Corinth, which they had strongly fortified. In July of the same year he was appointed general-in-chief of the armies of the United States—a position he held till March 1864, when he was succeeded by Grant and was appointed chief of the staff. In April 1865 he held the command of the military division of the James and in August of the same year of the military division of the Pacific, which he retained till March 1869, when he was transferred to that of the south, a position he held till his death at Louisville, January 9, 1872.

Besides his work on the *Science of War*, General Halleck was the author of *Bitumen, its Varieties, Properties, and Uses*, 1841; *The Mining Laws of Spain and Mexico*, 1859; a translation of De Fooz *On the Law of Mines*, with an introduction, 1860; *International Law*, 1861; a translation of Jomini's *Life of Napoleon*, 1864; and a *Treatise on International Law and the Laws of War, prepared for the use of Schools and Colleges*, 1866.

HALLER, ALBRECHT VON (1708-1777), one of the greatest of the anatomists and physiologists of the 18th century, was born of an old Swiss family at Bern, October 16, 1708. Prevented by long-continued ill-health from taking part in boyish sports, he had the more opportunity for the development of his precocious mind. At the age of four, it is said, he used to read and expound the Bible to his father's servants; before he was ten he had sketched a Chaldean grammar, prepared a Greek and a Hebrew vocabulary, compiled a collection of two thousand biographies of famous men and women on the model of the great works of Bayle and Moreri, and written in Latin verse a satire on his tutor, who had warned him against a too great excursiveness. When still hardly fifteen he was already the author of numerous metrical translations from Ovid, Horace, and Virgil, as well as of original lyrics, dramas, and an epic of four thousand lines on the origin of the Swiss confederation, writings which he is said on one occasion to have rescued from a fire at the risk of his life, only, however, to burn them a little later (1729) with his own hand. Haller's attention had been directed to the profession of medicine while he was residing in the house of a physician at Biel after his father's death in 1721; and, following the choice then made, he while still a sickly and excessively shy youth went in his sixteenth year to the university of Tübingen (December 1723), where he studied under Camerarius and Duvernoy. Dissatisfied with his progress, he in 1725 exchanged Tübingen for Leyden, where Boerhaave was in the zenith of his fame, and where Albinus had already begun to lecture in anatomy. At that university he graduated in May 1727, undertaking successfully in his thesis to prove that the so-called salivary duct, claimed as a recent discovery by

Coschwitz, was nothing more than a blood-vessel. Haller then visited London, making the acquaintance of Sir Hans Sloane, Cheselden, Pringle, Douglas, and other scientific men; next, after a short stay in Oxford, he visited Paris, where he studied under Ledran and Winslow; and in 1728 he proceeded to Basel, where he devoted himself to the study of the higher mathematics under John Bernoulli. It was during his stay there also that his first great interest in botany was awakened; and, in the course of a tour through Savoy, Baden, and several of the Swiss cantons, he began a collection of plants which was afterwards the basis of his great work on the flora of Switzerland. In 1729 he returned to Bern and began to practise as a physician; his best energies, however, were devoted to the botanical and anatomical researches which rapidly gave him a European reputation, and procured for him from George II. in 1736 a call to the chair of medicine, anatomy, botany, and surgery, in the newly-founded university of Göttingen. The quantity of work achieved by Haller in the seventeen years during which he occupied this post was immense. Apart from the ordinary work of his classes, which entailed upon him the task of newly organizing a botanical garden, an anatomical theatre and museum, an obstetrical school, and similar institutions, he carried on without interruption these original investigations in botany and physiology, the results of which are preserved in the numerous works associated with his name; he continued also to persevere in his youthful habit of poetical composition, while at the same time he conducted a monthly scientific journal to which he is said to have contributed twelve thousand articles relating to almost every branch of human knowledge. He also warmly interested himself in most of the religious questions, both ephemeral and permanent, of his day; and the erection of the Reformed church in Göttingen was mainly due to his unwearied energy. Notwithstanding all this variety of absorbing interests he never felt at home in Göttingen; his untravelled heart kept ever turning towards his native Bern (where he had been elected a member of the great council in 1745), and in 1753 he resolved to resign his chair and return to Switzerland. The twenty-one years of his life which followed were largely occupied in the discharge of his duties as "amman," to which honourable office he had been chosen by his fellow-citizens, and in the preparation of his *Bibliotheca Medica*, the botanical, surgical, and anatomical parts of which he lived to complete; but he also found time to write the three philosophical romances, — *Usong* (1771), *Alfred* (1773), and *Fabius and Cato* (1774), — in which his views as to the respective merits of despotism, of limited monarchy, and of aristocratic republican government are fully set forth. About 1773 the state of his health rendered necessary his entire withdrawal from public business; for some time he supported his failing strength by means of opium, on the use of which he communicated a paper to the *Proceedings* of the Göttingen Royal Society in 1776; the excessive use of the drug is believed, however, to have hastened his death, which occurred on the 17th of December 1777. Haller, who had been three times married, left eight children, the eldest of whom, Gottlieb Emanuel, attained to some distinction as a botanist and as a writer on Swiss history.

For some account of Haller's contributions to the sciences of which he was especially an ornament, see the articles ANATOMY (vol. i. p. 814) and PHYSIOLOGY. Subjoined is a classified but by no means an exhaustive list of his very numerous works in various branches of science and literature:—(1) Anatomical:—*Icones anatomicae* (1748–54); *Disputationes anatomicae selectiores* (1748–52); and *Opera acad. minora anatomici argumenti* (1762–68). (2) Physiological:—*De respiratione experimentum anatomica* (1747); *Prævia lineæ physiologicae* (1747); and *Elementa physiologiae corporis humani* (1757–60). (3) Pathological and surgical:—*Opuscula pathologica* (1755); *Disputationum chirurg. collectio* (1777); also careful editions of Boerhaave's *Prælectiones academicae in proprias insti-*

tutiones rei medicæ (1739), and of the *Artis medicæ principia* of the same author (1769–74). (4) Botanical:—*Enumeratio stirpium Helveticarum* (1742); *Opuscula botanica* (1749); *Bibliotheca botanica* (1771). (5) Theological:—*Briefe über die wichtigsten Wahrheiten der Offenbarung* (1772); and *Briefe zur Vertheidigung der Offenbarung* (1775–77). (6) Poetical:—*Gedichte* (1752, 12th ed. 1777). His three romances have been already mentioned. Several volumes of lectures and "Tagebücher" or journals were published posthumously.

See J. G. Zimmermann, *Das Leben des Herrn von Haller* (1766), and the articles by Förster and Seiler in Ersch and Gruber's *Encyclopædie*.

HALLEY, EDMUND (1656–1742), an eminent astronomer, was born at Haggerston, near London, October 29, 1656. His father, a wealthy soapboiler, desiring to give his only son an education suitable to his promising genius, placed him at St Paul's School, where he was equally distinguished for classical as for mathematical ability. Before leaving it for Queen's College, Oxford, which he entered as commoner in 1673, he had observed the change in the variation of the compass, and, at the age of nineteen, he supplied a new and improved method of determining the elements of the planetary orbits. His detection of considerable errors in the tables then in use led him to the conclusion that a more accurate ascertainment of the places of the fixed stars was indispensable to the progress of astronomy; and, finding that Flamsteed and Hevelius had already undertaken to catalogue those visible in northern latitudes, he assumed to himself the task of making observations in the southern hemisphere. A recommendation from Charles II. to the East India Company procured for him an apparently suitable, though, as it proved, ill-chosen station, and in November 1676 he embarked for St Helena. On the voyage he noticed the retardation of the pendulum in approaching the equator; and during his stay on the island he observed the transit of Mercury, which suggested to him the important idea of employing similar phenomena for the calculation of the solar distance. He returned to England in November 1678, having by the registration of 360 stars won the title of the "Southern Tycho," and by the translation to the heavens of the "Royal Oak," earned a degree of master of arts, conferred at Oxford by the king's command December 3, 1678, almost simultaneously with his election as fellow of the Royal Society. Six months later, the indefatigable astronomer started for Dantzic to set at rest a dispute of long standing between Hooke and Hevelius as to the respective merits of plain or telescopic sights; and towards the end of 1680 he proceeded on a Continental tour. In Paris he observed with Cassini the great comet of 1680 after its perihelion passage; and having returned to England, he married in 1682 Mary, daughter of Mr Tooke, auditor of the exchequer, with whom he lived harmoniously for fifty-five years. He now fixed his residence at Islington, engaged chiefly upon lunar observations, with a view to the great desideratum of a method of finding the longitude at sea. His mind, however, was also busy with the momentous problem of gravity. Having reached so far as to perceive that the central force of the solar system must decrease inversely as the square of the distance, and applied vainly to Wren and Hooke for further elucidation, he made in August 1684 that journey to Cambridge for the purpose of consulting Newton, which resulted in the publication of the *Principia*. The labour and expense of passing this great work through the press devolved upon Halley, who also wrote the prefixed hexameters ending with the well-known line—

Nec fas est propius mortali attingere divos.

In 1696 he was, although a zealous Tory, appointed controller of the mint at Chester, and (August 19, 1698) he received a commission as captain of the "Paramour Pink" for the purpose of making extensive observations on the conditions of terrestrial magnetism. This task he accomplished in a voyage which lasted two years, and extended

to the 52d degree of S. latitude. The results were published in a *General Chart of the Variation of the Compass* in 1701; and immediately afterwards he executed by royal command a careful survey of the tides and currents of the British Channel, an elaborate map of which he produced in 1702. On his return from a journey to Dalmatia, for the purpose of selecting and fortifying the port of Trieste, he was nominated, November 1703, Savilian professor of geometry at Oxford, and received an honorary degree of doctor of laws. Between 1713 and 1721 he acted as secretary to the Royal Society, having previously during eight years (1685-93) filled the same office, and early in 1720 he succeeded Flamsteed as astronomer-royal. Although in his sixty-fourth year, he undertook to observe the moon through an entire revolution of her nodes (eighteen years), and actually carried out his purpose. He died in the full possession of his faculties, January 14, 1742, at the age of eighty-five.

Hälley's most notable scientific achievements were—his detection of the "long inequality" of Jupiter and Saturn, and of the acceleration of the moon's mean motion; his discovery of the proper motions of the fixed stars; his theory of variation, including the hypothesis of four magnetic poles, revived by Hansteen in 1819, and his suggestion of the magnetic origin of the aurora borealis; his calculation of the orbit of the 1682 comet (the first ever attempted), coupled with a prediction of its return, strikingly verified in 1759 and 1835; and his indication (in 1716, *Phil. Trans.*, No. 348) of a method still used for determining the solar parallax by means of the transits of Venus.

His principal works are *Catalogus Stellarum Australium*, London, 1679, the substance of which was embodied in vol. iii. of Flamsteed's *Historia Cælestis*, 1725; *Synopsis Astronomiæ Cometicæ*, Oxford, 1705; *Astronomical Tables*, London, 1752; also eighty-one miscellaneous papers of considerable interest, scattered through the *Philosophical Transactions*. To these should be added his version from the Arabic (which language he acquired on the purpose) of the treatise of Apollonius *De sectione rationis*, with a restoration of his two lost books *De sectione spatii*, both published at Oxford in 1706; also his fine edition of the *Conics* of Apollonius, with the treatise by Serenus *De sectione cylindri et conæ*, Oxford, 1710, folio. His edition of the *Spherics* of Menelaus was published by his friend Dr Costard in 1758.

HALLOWEVEN or **HALLOWE'EN**, the vigil of Halloween or All Saints' Day. For some account of the singular observances by which it used to be, and to some extent still is, distinguished in Scotland and elsewhere, reference may be made to such works as Brand's *Popular Antiquities*, Chambers's *Book of Days*, or better still to the well-known poem of Burns. Though sometimes neglected in modern practice, the most essential part of Hallowe'en ritual seems to consist in the lighting by each household of a bonfire at nightfall. This points to the very ancient and widely-diffused practice of kindling sacred fires at certain seasons of the year. While the Germanic nations had their Osterfeuer and Johannisfeuer, the Celtic had their Bealtine or Beltine (see BELTANE) and Samhtheine, the former on the eve of May 1, and the latter on the eve of November 1. Probably the winter as well as the summer festival was from the beginning regarded as a season at which the fairies were both unusually active and unusually propitious; but there is no evidence to show that the methods of divination at present usually resorted to, although of great antiquity, were originally regarded as limited in their efficacy to any one day. See Grimm's *Deutsche Mythologie*, ch. xx. (Elemente), and ch. xxxiv. (Aberglaube).

HALLUIN, a town of France, in the department of Nord and arrondissement of Lille, and 11 miles N.N.E. of Lille, is situated near the right bank of the Lys. It contains several religious and benevolent institutions, including a hospital. The manufactures comprise linen and cotton goods, bricks, and oil. The family of Halluin or Halowin is mentioned as early as 1266. Baron Walter II. was one

of the forty hostages sent to England in 1360 in exchange for the French King John. George of Halluin or Halowin was a general in the service of Henry V., and an ambassador to England. He died in 1537, leaving several treatises in Latin. The family, to which the title of duke had been granted in 1581, became extinct about the middle of the 17th century. Population of the town (1876), 8584.

HALMSTAD, the chief town of the Swedish län Halland or Halmstad, is situated on the east shore of the Cattegat, about 76 miles S.S.E. of Gothenburg, and at the mouth of the river Nissa. The castle is the residence of the governor of the province. Mention of the church of Halmstad occurs as early as 1462, and the fortifications are mentioned first in 1225. The latter were demolished in 1736. The Dominican and Franciscan monasteries, formerly in the town, are now quite destroyed. The harbour, built in 1837-40, at a cost of about £5250, admits ships of 10 feet draught, by means of which some trade in deals, pitch, and tar is carried on. The salmon-fishery is important. An archaeological society holds its meetings in Halmstad, and the popular magazine *Svenska Familj Journalen* is published there. There are both mineral and sea-water baths in the neighbourhood. The oldest town-privileges of Halmstad date from 1307, while the first recorded event in its military history is the battle of Nissa, between Harold Hardrada and Sven Ulfsson. During the revolt of the miner Engelbrekt, it twice fell into the hands of the rebels—in 1434 and 1436. The town appears to have been frequently chosen as the meeting-place of the rulers and delegates of the three northern kingdoms; and under the union of Calmar it was appointed to be the place for the election of a new Scandinavian monarch whenever necessary. The län of Halland formed part of the territory of Denmark in Sweden, and accordingly, in 1534, during his war with the Danes, Gustavus Vasa assaulted and took its chief town. In 1660, by the treaty of Copenhagen, the whole district was ceded to Sweden. In 1676 Charles XII. defeated near Halmstad a Danish army, which was attempting to retake the district, and since that time Halland has formed part of Sweden. The population of the town in 1875 was 7136.

HALO (Latin, *halo*; Greek, ἅλως), a luminous circle of light surrounding one of the heavenly bodies. A better definition perhaps would be "a ring of coloured light formed by refraction, on the passage of light from one of the heavenly bodies through the aqueous vapour surrounding the earth." This would include coronæ and rainbows, and similar phenomena.

Halos may be divided into the following classes:—

- | | | | | |
|------------------------------------|--|----------------|------------------------------------|-------------------------|
| 1. Encircling..... | <table border="0"> <tr><td>{ A. Simple.</td></tr> <tr><td>{ B. Compound, i.e., halo systems.</td></tr> <tr><td>{ C. Coronæ.</td></tr> </table> | { A. Simple. | { B. Compound, i.e., halo systems. | { C. Coronæ. |
| { A. Simple. | | | | |
| { B. Compound, i.e., halo systems. | | | | |
| { C. Coronæ. | | | | |
| 2. Opposite..... | <table border="0"> <tr><td>{ a. Rainbows.</td></tr> <tr><td>{ b. Fog-bows and mist halos.</td></tr> <tr><td>{ γ. Mountain spectres.</td></tr> </table> | { a. Rainbows. | { b. Fog-bows and mist halos. | { γ. Mountain spectres. |
| { a. Rainbows. | | | | |
| { b. Fog-bows and mist halos. | | | | |
| { γ. Mountain spectres. | | | | |

They are usually seen surrounding the sun or the moon, but in the tropics small halos were observed by Humboldt round the planet Venus. The formation of encircling halos of the classes A and B is generally attributed to refraction and reflexion of the rays of light by the presence of minute snow crystals in the upper strata of the air, and they occur usually when cirrus or cirro-stratus clouds exist. This theory was originated by Descartes, and was adopted by Marriotte (in 1686), and subsequently followed by Dr Young and Sir Isaac Newton. It is, however, probable that some halos and certainly all coronæ (class C) are formed by refraction of light from globules of water suspended in the atmosphere. Simple halos are either about $22\frac{1}{2}$ degrees or 47 degrees in diameter. The ice or snow crystals, being hexagonal in form, sometimes produce a double refraction.

and then the large and small halos are seen at the same time, and, reflexion taking place from the surfaces of the crystals, additional halos or parts of halos are formed as in

FIG. 1.—Solar halos and parhelia seen at Brighton, June 5, 1875, by F. E. Sawyer, from 4 to 5.45 P.M. The halo α was a large one, having the zenith for its centre and going entirely round the heavens. It was a white band, and passed through the sun and the mock suns. The parhelia were of prismatic colours and had flaming tails.

figs. 1 and 2. At the points of intersection of the halos, images of the sun or moon sometimes appear; when seen with the former, they are called *parhelia* or *mock-suns*, and when with the latter, *paraselenæ* or *mock-moons*. They are sometimes accompanied with flaming tails, and are usually of prismatic colours, as also are the halos and coronæ. The latter are seen when fleecy clouds or mist intervene between the spectator and the sun or moon, to which they are in immediate proximity, thereby being distinguished from the halos, which are formed at a distance from those luminaries. The predominating colour in coronæ is red or orange.

FIG. 2.—Halo system observed at Aberdeen, January 23, 1870, at 2 P.M. (see Symons's *Monthly Meteorological Magazine*, 1870, pp. 1 and 32, and frontispiece).

The second principal division of halos includes those which are seen opposite to the sun and moon. The first class of these comprises rainbows (α), which are occasioned by refraction of the light from the sun or moon, produced by falling rain, causing a bow with the prismatic colours in concentric bands and arranged as they appear in the solar spectrum. When the rain is abundant an inner bow is formed, the colours in which are in inverted order. Rainbows when seen from mountain tops and the tops of ships are completely circular. Fog-bows and mist halos (β) are somewhat similar.

FIG. 3.—A mountain spectro as seen by F. E. Sawyer on the Rigi, shortly after sunrise, August 18, 1877.

dicating a dispersion of the fog or mist. They appear to be formed in a horizontal or very oblique plane. Mist halos are seen in the vapour of fountains or waterfalls, and resemble rainbows. Mountain spectres (γ) are caused by reflexion, and often appear accompanied by chromatic halos (see fig. 3). They generally occur on mountains when the sky between the observer and the sun is clear and there is a mist or cloud on the side of the mountain opposite to the sun, on which the summit of the mountain and the buildings and persons standing near are reflected. The most notable of mountain spectres is that of the Brocken, in the Harz mountains. Howitt says of this:—

“If the fog is very dry, you see not only yourself but your neighbour; if very damp, only yourself, surrounded by a rainbow-coloured glory, which becomes more lustrous and beautiful the damper and thicker the fog is, and the nearer it approaches.”

Many of the ancient descriptions of miraculous appearances in the heavens may be attributed to the phenomena before mentioned. Among the chief of these is the appearance of a cross which the emperor Constantine alleged he saw in the heavens about noon when marching against Maxentius (about 313 A.D.), and which was the cause of

FIG. 4.—A system of lunar halos and paraselenæ figured in Buchan's *Meteorology*, p. 193.

his conversion to Christianity (Eusebius, *Vita Constant.*, i. 27). Some writers have doubted the occurrence; but it is quite possible Constantine saw part of a system of solar halos, and two of these at right angles would form a cross (see fig. 4). The *Brighton Herald* of April 10, 1852, records a similar phenomenon on April 1st of that year at Brighton:—

“Sun setting, evening very fine with slight haze westward, when a ray of brilliant light shot upwards about 20 degrees above the horizon, directly perpendicular from the sun, and soon after its appearance it was crossed by a horizontal band of light of a paler colour, but about the same breadth. It formed a perfect cross, and lasted half an hour.”

Halos and rainbows are considered valuable prognostications of future weather. Fragments of rainbows seen on detached clouds are called *wind-dogs*, and are said to be a sign of wind. When the diameter of a corona contracts it shows the water particles are uniting into larger ones which may fall in rain, whereas if the corona extends, the particles are growing smaller, indicating increasing dryness. The open side of a halo is in some places considered to foretell the quarter from which bad weather may be expected.

See M. A. Bravais, “Mémoire sur les Halos et les Phénomènes optiques qui les accompagnent” (*Journal de l'École Royale Polytechnique*, 31 cahier, tome 18, Paris, 1847); Buchan, *Introductory Text-Book of Meteorology*, 1871; *Proc. Met. Soc.*, 1875, vol. ii., new ser., pp. 438 to 444. (F. E. S.)

HALS, FRANS, was born at Antwerp according to most authorities in 1584, and died at Haarlem in 1666. As a portrait painter second only to Rembrandt, he displayed extraordinary talent and quickness in the exercise of his art coupled with improvidence in the use of the means which that art secured to him. At a time when the Dutch nation fought for independence and won it, Hals appears in the ranks of its military guilds. He was also a member of the chamber

of rhetoric, and (1644) chairman of the painters' corporation at Haarlem. But as a man he had failings unhappily common to persons of his profession in that age. He so ill-treated his first wife that she died prematurely in 1616; and he barely saved the character of his second by marrying her in 1617. Another defect was partiality to drink, which led him into low company. Still he brought up and supported a family of ten children with success till 1654, when the forced sale of his pictures and furniture, at the suit of a baker to whom he was indebted for bread and money, brought him to absolute penury. Subsequently to this he was reduced to still greater straits, and his rent and firing were paid by the municipality, which afterwards gave him (1664) an annuity of 200 florins. We may admire the spirit which enabled him under these circumstances to produce some of his most striking productions. We regret to find his widow seeking outdoor relief from the guardians of the poor and dying obscurely in a hospital.

Hals's pictures illustrate the various strata of society into which his misfortunes led him. His banquets or meetings of officers, of sharpshooters, and guildsmen are the most interesting of his works. But they are not more characteristic than his low-life pictures of itinerant players and singers. His portraits of gentfolk are true and noble, but hardly so expressive as those of fishwives and tavern heroes. His first master was Van Mander the painter and historian, of whom he possessed some pictures which went to pay the debt of the baker above alluded to. But he soon left behind him the practice of the time illustrated by Schoreel and Moro, and, emancipating himself gradually from tradition, produced pictures remarkable for truth and dexterity of hand. We prize in Rembrandt the golden glow of effects based upon artificial contrasts of low light in immeasurable gloom. Hals was fond of daylight of silvery sheen. Both men were painters of touch, but of touch on different keys. Rembrandt was the bass, Hals the treble. The latter is perhaps more expressive than the former. He seizes with rare intuition a moment in the life of his sitters. What nature displays in that moment, he reproduces thoroughly in a very delicate scale of colour, and with a perfect mastery over every form of expression. He becomes so clever at last that exact tone, light and shade, and modelling are all obtained with a few marked and fluid strokes of the brush.

In every form of his art we can distinguish his earlier style from that of later years. Two Boys Playing and Singing in the gallery of Cassel, and a Banquet of Officers (1616) in the museum of Haarlem, exhibit him as a careful draughtsman capable of great finish, yet spirited withal. His flesh, less clear than it afterwards becomes, is pastose and burnished. Further on he becomes more effective, displays more freedom of hand, and a greater command of effect. At this period we note the beautiful full length of a young lady of the Berensteyn family in the house of that name at Haarlem, and a splendid full length of a Patrician leaning on a sword in the Lichtenstein collection at Vienna. Both these pictures are equalled by the Banquets of Officers of 1627, and a Meeting of the Company of St George of 1633 in the Haarlem Museum. A picture of the same kind in the town-hall of Amsterdam, with the date of 1637, suggests some study of the masterpieces of Rembrandt, and a similar influence is apparent in a picture of 1641 at Haarlem, representing the "Regents" of the Company of St Elizabeth. But Rembrandt's example did not create a lasting impression on Hals. He gradually dropped more and more into grey and silvery harmonies of tone; and two of his canvases, executed in 1664, the Regents and Regentesses of the Oudemanshuis at Haarlem, are masterpieces of colour, though in substance all but monochromes.

There are portraits by Hals in many Continental galleries. Comparatively few have found their way to England. Sir Richard Wallace's Cavalier, Lord Chesterfield's Toper, Lord Radnor's Likenesses of an Old Man and Woman, are the best that we can point out. Abroad a better selection may be found. At Amsterdam is the celebrated Flute Player, once in the Dupper collection at Dort, and the pair called Hals and his Wife; at Brussels, the patrician Heythuysen; at the Louvre, Descartes; at Dresden, the painter Van der Vinne. Hals's sitters were taken in every class of society, — admirals, generals, and burgomasters pairing with merchants, lawyers, clerks. To register all that we find in public galleries would involve much space. There are nine portraits at Berlin, five at Frankfurt, six at Cassel, five at St Petersburg, three at the Louvre, two at Brussels, four at Dresden, two at Gotha. In private collections, chiefly in Paris, Haarlem, and Vienna, we find an equally important number. Amongst his most successful representations of fishwives and termagans we should distinguish the Hille Bobbe of the Berlin Museum, and the Hille Bobbe with her Son in the Dresden Gallery. Itinerant players are best illustrated in the Neville-Goldsmith collection at the Hague, and the Six collection at Amsterdam. Boys and girls singing, playing, or laughing, or men drinking, are to be found in the gallery of Schwerin, in the Arenberg collection, and in the royal palace at Brussels. The latest works of Hals in each of these branches are distinguished by comparatively black shadow.

Of the master's numerous family none has left a name except Frans Hals the younger, born about 1622, who died in 1669. His pictures represent cottages and poultry; and the Vanitas at Berlin, a table laden with gold and silver dishes, cups, glasses, and books is one of his finest works and deserving of a passing glance.

Quite in another form, and with much of the freedom of the elder Hals, Dirk Hals, his brother (born at Haarlem, died 1656), is a painter of festivals and ball-rooms. But Dirk had too much of the freedom and too little of the skill in drawing which characterized his brother. He remains second on his own ground to Palamedes. A fair specimen of his art is a Lady playing a Harpsichord to a Young Girl and her Lover in the Van der Hoop collection at Amsterdam. More characteristic, but not better, is a large company of gentfolk rising from dinner, in the academy at Vienna.

HALSTEAD, a market-town of England, county of Essex, is situated on the Colne Valley Railway and on a steep acclivity rising from the river Colne, 48 miles N.E. of London. Though irregularly built it has a neat appearance, and most of the streets are wide and clean. The principal buildings are the parish church, a fine Gothic edifice in the Perpendicular style, containing a monument supposed to be that of Sir Robert Burchier, lord chancellor to Edward III.; the church of the Holy Trinity, in the Early English style, erected in 1844; the Lady Mary Ramsay's grammar school, the mechanics' institute, and the corn exchange. The principal industries are the manufacture of silk, crape, and velvet. Straw plaiting, at one time the principal occupation of the women, is now nearly extinct. The population of the town in 1871 was 5783, and of the parish 6904.

HALYBURTON, THOMAS (1674–1712), a distinguished Scottish divine, was born at Dupplin, near Perth, on the 25th of December 1674. His father, one of the ejected ministers, having died in 1682, he was taken by his mother in 1685 to Rotterdam, where he for some time attended with advantage the school founded by Erasmus. On his return to his native country in 1687 he completed his elementary education at Perth and Edinburgh, and in 1692 entered the university of St Andrews. In 1700 he was ordained minister of the parish of Ceres, and in 1710 he was recommended by the synod of Fife for the chair of theology in St Leonard's College, St Andrews, to which accordingly he was appointed by Queen Anne. After a brief term of active professorial life he died in 1712. The works by which he continues to be known, especially in Scotland, were all of them published after his death.

The treatise entitled *Natural Religion Insufficient, and Revealed Necessary, to Man's Happiness in his present State* (1714) is an able reply to some of the arguments of Lord Herbert and of Blount; the *Great Concern of Salvation* (1721), still read, handles questions of practical and experimental religion with great earnestness and in a manner that exhibits favourably one of the best types of piety current in his time; the *Memoirs* written by himself, which have been frequently reprinted, are similarly interesting and valuable.

HAM (חַם), the second son of Noah (Gen. v. 32), and the progenitor of Cush, Mizraim, Phnt, and Canaan (Gen. x. 6). On the assumption that these early genealogies are geographical rather than personal or even ethnological, the name Ham, which in Hebrew radically signifies "hot," would seem to indicate the torrid zone; and this inference, though not supported, so far as has been hitherto discovered, by any corresponding explanation of the names of Shem and Japheth, at least harmonizes well with the fact that on the whole Shem seems intended to denote the intermediate and Japheth the northern regions of the world as known to the compiler of the Book of Genesis. The attempt has sometimes been made to identify Ham with Keme or Chemi, an old native name of Egypt, signifying "black," and having reference, it is supposed, to the colour of the soil. But this identification has no adequate etymological support (see Lepsius in Herzog and Plitt's *Encykl.*, i. 166); and the allusions in several of the Psalms to Egypt as the land of Ham (Ps. cv. 23, cvi. 22) are not inconsistent with the belief that the latter name was primarily used in a much wider and less local sense. The solitary incident regarding Ham related in Gen. ix. 20-27 seems intended to indicate, from the Israelite point of view, the immodest and sensual tendencies of the Canaanites and other "Hamitic" peoples.

HAM, a small town of France, in a marshy district on the left bank of the Somme, about 40 miles south-east of Amiens, on the railway between Amiens and Rheims. It had in 1876 a population of only 3122; but historically it is a place of very considerable importance. From the 9th century onwards it appears as the seat of a lordship which, after the extinction of its hereditary line, passed in succession to the houses of Coucy, Enghien, Luxembourg, Rohan, Vendôme, and Navarre, and was finally united to the French crown on the accession of Henry IV. In 1108 an abbey of canons regular of the congregation of France was founded at Ham; and it continued to exist till the great Revolution, the revenue of its abbot about that time amounting to 15,000 livres. The abbey church (Notre Dame) dates from the 12th century, but in April 1760 all the inflammable portions of the building were destroyed by a conflagration caused by lightning, and during the present century a process of restoration has been carried out under the direction of M. Corroyer. Of special note are the bas-reliefs of the nave and choir, executed in the 17th and 18th centuries, and the crypt of the 11th century, which contains the sepulchral effigies of Odo of Ham and his wife Isabella of Béthencourt. The castle, founded by Odo in the 12th century, was rebuilt in the 13th and extended in the 14th, and its present appearance is mainly due to Louis of Luxembourg, count of St Pol, who between 1436 and 1470 not only furnished it with outworks, but gave such a thickness to the towers and curtains, and more especially to the great tower or donjon which still bears his motto *Mon Myeux*, that they would offer a long resistance even to modern artillery (Viollet-le-Duc). It forms a rectangle 395 feet long by 263 feet broad, with a round tower at each angle and two square towers protecting the curtains. The eastern and western sides are each defended by a demi-lune. The Constable's Tower, for so the great tower is

usually called in memory of St Pol, has a height of about 100 feet, and the thickness of the walls is 36 feet; the interior is occupied by three large hexagonal chambers in as many stories. As the castle of Ham has frequently been used as a state prison both in ancient and modern times, the list of those who have tasted its hospitality is an interesting one, including Joan of Arc, Louis of Bourbon, the ministers of Charles X., Louis Napoleon, Cavaignac, and Lanoricrière. Louis Napoleon was there for six years, and at last effected his escape in the disguise of a workman. During 1870-71 Ham was several times captured and recaptured by the belligerents.

A view and plan of the town will be found in Caspar Merian's *Topographia Gallia*, Frankfort, 1656; and the former is copied in the *Gentleman's Magazine*, 1831. See also De Feuillede, *Le Château de Ham*, 1842; and Ch. Comart, *Ham, son château*, 1864.

HAMADAN, a town of Persia, in the province of Irak-Adjemi, 162 miles W.S.W. of Teheran, in the district of the Djebel at the foot of the Elvend or Arwand Mountain, the Orontes of the ancients. It is a busy place of about 50,000 inhabitants, and has large and well-stocked bazaars. Its principal industry is the manufacture of copper ware. Gold is collected in the streams traversing the town, and the surrounding country is remarkable for its beauty and fertility. Every quarter is shut off from its neighbours by gates which are closed at night. The chief objects of interest are the tombs of Esther and Mordecai, and of the Arabian philosopher Avicenna. The former, constructed of black wood, are adorned with Hebrew inscriptions which may be seen figured in Ker Porter's *Travels*. According to these, the pavilion or temple over the tombs was erected in the year of the creation 4474. The ordinary inhabitants of Hamadan attach more importance to a stone image of a lion which they assert was set up by Belinas a magician, to mitigate the cold from which their city suffers severely. "Hamadan," says Hamadani, echoing a common Persian complaint, "is the most hateful of towns; its children are old men for ugliness, and its old men are children for silliness." At the same time the town has produced many eminent men, among whom are Abu 'l Fadhl Ahmed Hamadani himself, Zafer ed Din the Persian poet, and Zamiri. The origin of the city is carried back by Hischam el Kelbi to Hamadan a grandson of Shem, but other writers are contented with a less antiquity. Its claims to be identified with the Ecbatana of the classical authors have been treated of under ECBATANA. The present town has almost no ancient remains, and especially there are no sculptured works. See Meynard, *Dictionnaire géographique de la Perse*.

HAMATH, the Hamath of the Bible, one of the oldest cities of Syria (Gen. x. 18), situated in the valley of the Orontes, 110 English miles N. (by E.) of Damascus. It finds a place among the northern boundaries of the Holy Land (Num. xxxiv. 8), and is frequently mentioned in Old Testament history (Num. xiii. 21, 2 Sam. viii. 9, 1 Kings viii. 65, 2 Kings xviii. 34, 2 Chron. viii. 3, Isa. x. 9, Amos vi. 2). The city lies in a narrow valley, the pass south of it being probably the "entering in of Hamath" (1 Kings viii. 65). The Orontes flows winding through it, and is spanned by four bridges. On the south-east the houses rise 150 feet above the river, and there are four other hills, that of the *Kalah* or castle being to the north 100 feet high. Twenty-four minarets rise from the various mosques. The houses are principally of mud, and the town stands amid poplar gardens with a fertile plain to the west. The castle is ruined, the streets are narrow and dirty, but the bazaars are good, and the trade with the Bedawin considerable. The numerous water-wheels (*nairah*), of enormous dimensions, raising water from the Orontes are the most remarkable features of the view. The population is stated in

official returns to consist of about 39,000 Moslems and 4000 non-Moslems. The curious Hamath inscriptions first mentioned by Burekhardt have lately attracted much attention. Four stones exist covered with ideographic designs in a character as yet quite unknown. The latest researches of Mr George Smith, however, indicate that the inscriptions are probably of Hittite origin, and other relics of that once powerful nation resembling the Hamath stones have been discovered farther east.

In the year 854 B.C. (according to the late George Smith) Hamath was taken by Salmanser, king of Assyria, who defeated an army of 1400 chariots and 10,000 footmen under Irhulena, king of the district. Again in 743 B.C. Tiglath Pileser II. reduced the city to tribute, and in 740 B.C. he defeated the Hamathites, who were assisted by Azariah, king of Judah. Another rebellion was crushed by Sargon in 720 B.C. After the Macedonian conquest of Syria Hamath was called Epiphania by the Greeks in honour of Antiochus IV., Epiphanes, and in the early Byzantine period it was known by both its Hebrew and its Greek name. In 639 A.D. the town surrendered to Abu 'Obeideh, one of Omar's generals, and the church was turned into a mosque. In 1103 A.D. Tancred captured the city and massacred the Isma'ileh defenders. In 1115 it was retaken by the Moslems, and in 1178 was occupied by Saladin. Abulfeda, prince of Hamah in the early part of the 14th century, is well known as an authority on Arab geography.

HAMANN, JOHANN GEORG (1730-1788), a distinguished writer on philosophical and theological subjects, was born at Königsberg in Prussia in 1730. His parents were of humble rank and small means. The education he received was comprehensive but unsystematic, and the want of definiteness in this early training doubtless tended to aggravate the peculiar instability of character which troubled Hamann's after life. In 1746 he began theological studies, but speedily deserted them and turned his attention to law. That too was taken up in a desultory fashion and quickly relinquished. Hamann seems at this time to have thought that any strenuous devotion to "bread-and-butter" studies was lowering, and accordingly gave himself entirely to reading, criticism, and philological inquiries. Such studies, however, were pursued without any definite aim or systematic arrangement, and consequently were productive of nothing. In 1752, constrained to secure some position in the world, he accepted a tutorship in a family resident in Livonia, but only retained it a few months. A similar situation in Courland he also resigned after about a year. In both cases apparently the rupture might be traced to the curious and unsatisfactory character of Hamann himself. After leaving his second post he was received into the house of a merchant at Riga named Berens, who contracted a great friendship for him and selected him as his companion for a tour through Dantzic, Berlin, Hamburg, Amsterdam, and London. Hamann, however, was quite unfitted for business, and, when left in London, gave himself up entirely to his fancies, and was quickly reduced to a state of extreme poverty and want. It was at this period of his life, when his inner troubles of spirit harmonized with the unhappy external conditions of his lot, that he began an earnest and prolonged study of the Bible; and from this time dates the tone of extreme pietism which is characteristic of his writings, and which undoubtedly alienated many of his friends. He returned to Riga, and was well received by the Berens family, in whose house he resided for some time. A quarrel, the precise nature of which is not very clear though the occasion is evident, led to an entire separation from these friends. In 1759 Hamann returned to Königsberg, and lived for several years with his father, filling occasional posts in Königsberg and Mitau. In 1767 he obtained a situation as translator in the excise office, and ten years later a post as storekeeper in a mercantile house. During this period of comparative rest Hamann was able to indulge in the long correspondence with learned friends which seems to have been his greatest pleasure. In 1784 the failure of some commercial speculations greatly reduced his means,

and about the same time he was dismissed with a small pension from his situation. The kindness of friends, however, supplied provision for his children, and enabled him to carry out the long-cherished wish of visiting some of his philosophical allies. He spent some time with Jacobi at Pempelfort and with Buchholz at Walbergen. At the latter place he was seized with illness, and died on the 21st June 1788.

Hamann's works resemble his life and character. They are entirely unsystematic so far as matter is concerned, chaotic and disjointed in style. To a reader not acquainted with the peculiar nature of the man, which led him to regard what commended itself to him as therefore objectively true, they must be moreover entirely unintelligible and, from their peculiar pietistic tone and scriptural jargon, probably offensive. A place in the history of philosophy can be yielded to Hamann only because he expresses in uncouth, barbarous fashion an idea to which other writers have given more effective shape. The fundamental thought is with him the unsatisfactoriness of abstraction or onesidedness. The *Aufklärung*, with its rational theology, was to him the type of abstraction. Even Epicureanism, which might appear concrete, was by him rightly designated abstract. Quite naturally, then, Hamann is led to object strongly to much of the Kantian philosophy. The separation of sense and understanding is for him unjustifiable, and only paralleled by the extraordinary blunder of severing matter and form. Concreteness, therefore, is the one demand which Hamann expresses, and as representing his own thought he used to refer to Giordano Bruno's conception of the identity of contraries. The demand, however, remains but a demand. Nothing that Hamann has given can be regarded as in the slightest degree a response to it. His hatred of system, incapacity for abstract thinking, and intense personality rendered it impossible for him to do more than utter the disjointed, oracular, obscure dicta which gained for him among his friends the name of "Magus of the North." Two results only appear throughout his writings,—first, the accentuation of belief, and, secondly, the transference of many philosophical difficulties to language. Belief is, according to Hamann, the groundwork of knowledge, and he accepts in all sincerity Hume's analysis of experience as being most helpful in constructing a theological view. In language, which he appears to regard as somehow acquired, he finds a solution for the problems of reason which Kant had discussed in the *Critique*. On the application of these thoughts to the Christian theology one need not enter.

None of Hamann's writings are of great bulk; most are mere pamphlets of some thirty or forty pages. A complete collection has been published by Roth (*Schriften*, 8vo, 1821-42), and by Gildemeister (*Leben und Schriften*, 6 vols., 1851-73). See also Petri, *Hamann's Schriften u. Briefe*, 4 vols., 1872-3; Poel, *Hamann, der Magus im Norden, sein Leben u. Mittheilungen aus seinen Schriften*, 2 vols., 1874-76. A very comprehensive essay on Hamann is to be found in Hegel's *Vernüchste Schriften*, ii. (*Werke*, bd. xvii.).

HAMÂSAH (more correctly HAMÂSEH), the name of a famous Arabian anthology compiled by Habib ibn Aus et-Tâi, surnamed Abû Temmâm (corruptly ABU-TEMAN, *q.v.*). The collection is so-called from the title of its first book, containing poems descriptive of constancy and valour in battle, patient endurance of calamity, steadfastness in seeking vengeance, manfulness under reproach and temptation, all which qualities make up the attribute called by the Arabs *hamâseh* (briefly paraphrased by Et-Tebrizi as *esh-shiddeh fil-amr*). It consists of ten books or parts, containing in all 884 poems or fragments of poems, and named respectively—(1) *El-Hamâseh*, 261 pieces; (2) *El-Marâthi*, "Dirges," 169 pieces; (3) *El-Adab*, "Manners," 54 pieces; (4) *En-Nesib*, "The Beauty and Love of Women," 139 pieces; (5) *El-Hijâ*, "Satires," 80 pieces; (6) *El-Adyâf wa-l-Medih*, "Hospitality and Panegyric," 143 pieces; (7) *Es-Sifât*, "Miscellaneous Descriptions," 3 pieces; (8) *Es-Seyr wa-n-No'ûs*, "Journeying and Drowsiness," 9 pieces; (9) *El-Mulah*, "Pleasantries," 38 pieces; and (10) *Medhemmet-en-nisâ*, "Dispraise of Women," 18 pieces. Of these books the first is by far the longest, both in the number and extent of its poems, and the first two together make up more than half the bulk of the work. The poems are for the most part fragments selected from longer compositions, though a considerable number are probably entire. They are taken from the works of Arab poets of all periods

down to that of Abū Temmām himself (the latest ascertainable date being 832 A.D.), but chiefly of the poets of the Ante-Islamic time (*Jāhiliyyān*), those of the early days of El-Islām (*Mukhadrimān*), and those who flourished during the reigns of the Umawī caliphs, 660–749 A.D. (*Islāmiyyān*). Perhaps the oldest in the collection are those relating to the war of Bāsūs, a famous legendary strife which arose out of the murder of Kuleyb, chief of the combined clans of Bekr and Teghlīb, and lasted for forty years, ending with the peace of Dhu-l-Mejāz, about 534 A.D. Of the period of the 'Abbāsī caliphs, under whom Abū Temmām himself lived, there are probably not more than sixteen fragments.

Most of the poems belong to the class of extempore or occasional utterances, as distinguished from *qasīdehs*, or elaborately finished odes. While the latter abound with comparisons and long descriptions, in which the skill of the poet is exhibited with much art and ingenuity, the poems of the *Hamāseh* are short, direct, and for the most part free from comparisons; the transitions are easy, the metaphors simple, and the purpose of the poem clearly indicated. It is due probably to the fact that this style of composition was chiefly sought by Abū Temmām in compiling his collection that he has chosen hardly anything from the works of the most famous poets of antiquity. Not a single piece from Imra'el-Queys occurs in the *Hamāseh*, nor are there any from 'Alqameh, Zuheyr, or El-A'shā; En-Nābigbah is represented only by two pieces (pp. 408 and 742 of Freytag's edition) of four and three verses respectively, 'Antarah by two pieces of four verses each (*Id.*, pp. 206, 209), 'Tarafeh by one piece of five verses (*Id.*, p. 632), Lebid by one piece of three verses (*Id.*, p. 468), and 'Amr son of Kulthūm by one piece of four verses (*Id.*, p. 236). The compilation is thus essentially an anthology of minor poets, and exhibits (so far at least as the more ancient poems are concerned) the general average of poetic utterance at a time when to speak in verse was the daily habit of every warrior of the desert.

To this description, however, there is an important exception in the book entitled *En-Nesīb*, containing verses relating to women and love. In the classical age of Arab poetry it was the established rule that all *qasīdehs*, or finished odes, must begin with the mention of women and their charms (*teshīb*), in order, as the old critics said, that the hearts of the hearers might be softened and inclined to regard kindly the theme which the poet proposed to unfold. The fragments included in this part of the work are therefore generally taken from the opening verses of *qasīdehs*; where this is not the case, they are chiefly compositions of the early Islamic period, when the school of exclusively erotic poetry (of which the greatest representative was 'Omar son of Abū Rabī'ah) arose.

The compiler was himself a distinguished poet in the style of his day, and wandered through many provinces of the Muslim empire earning money and fame by his skill in panegyric. About 220 A.H. he betook himself to Khurāsān, then ruled by 'Abd-allāh son of Tāhir, whom he praised and by whom he was rewarded; on his journey home to El-Īrāq he passed through Hamadān, and was there detained for many months a guest of Abu-l-Wafā son of Selemeh, the road onward being blocked by heavy falls of snow. During his residence at Hamadān Abū Temmām is said to have compiled or composed, from the materials which he found in Abu-l-Wafā's library, five poetical works, of which one was the *Hamāseh*. This collection remained as a precious heirloom in the family of Abu-l-Wafā until their fortunes decayed, when it fell into the hands of a man of Dinawar named Abu-l-'Awādhil, who carried it to Isfahān and made it known to the learned of that city.

The worth of the *Hamāseh* as a store-house of ancient legend, of faithful detail regarding the usages of the pagan time and early simplicity of the Arab race, can hardly be exaggerated. The high level of excellence which is found in its selections, both as to form and matter, is remarkable, and caused it to be said that Abū Temmām displayed higher qualities as a poet in his choice of extracts from the ancients than in his own compositions. What strikes us chiefly in the class of poetry of which the *Hamāseh* is a specimen, is its exceeding truth and reality, its freedom from artificiality and hearsay, the evident first-hand experience which the singers possessed of all of which they sang. For historical purposes the value of the collection is not small; but most of all there shines forth from it a complete portraiture of the hardy and manful nature, the strenuous life of passion and battle, the lofty contempt of cowardice, niggardliness, and servility, which marked the valiant stock who bore El-Islām abroad in a flood of new life over the out-worn civilizations of Persia, Egypt, and Byzantium. It has the true stamp of the heroic time, of its weaknesses and crime as of its strength and beauty.

No less than twenty commentaries on it are enumerated by Hāji Khalīfeh. Of these the earliest was by Abū Riyāsh (otherwise Er-Riyāshī), who died in 257 A.H.; excerpts from it, chiefly in elucidation of the circumstances in which the poems were composed, are frequently given by Et-Tebrīzī. He was followed by the famous grammarian Abu-l-Fath ibn el-Jinnī (died 392 A.H.), and later by Shihāb ed-Din Ahmed el-Marzūqī of Isfahān (died 421 A.H.). Upon El-Marzūqī's commentary is chiefly founded that of Abū Zekeriyā Yahyā et-Tebrīzī (born 421 A.H., died 502), which has been published by the late Professor G. W. Freytag of Bonn, together with a Latin translation and notes (1828–1851). This monumental work, the labour of a life, is a treasure of information regarding the classical age of Arab literature which has not perhaps its equal for extent, accuracy, and minuteness of detail, in Europe. No other complete edition of the *Hamāseh* has been printed in the West; but in 1856 one appeared at Calcutta under the names of Maulavi Ghulām Rabbāni and Kabir-ud-din Ahmad. Though no acknowledgment of the fact is contained in this edition, it is a simple reprint of Professor Freytag's text (without Et-Tebrīzī's commentary), and follows its original even in the misprints (corrected by Freytag at the end of the second volume, which being in Latin the Calcutta editors do not seem to have consulted). It is thus worthless as a fresh critical authority, and, owing to the absence of a commentary, of little use to the student; its only merit is that it contains in an appendix of 12 pages a collection of verses (and some entire fragments) not found in Et-Tebrīzī's recension, but stated to exist in some copies consulted by the editors; these are, however, very carelessly edited and printed, and in many places unintelligible.

The *Hamāseh* has been rendered with the utmost skill and spirit into German verse by the illustrious Friedrich Rückert (Stuttgart, 1846), who has not only given translations of almost all the poems proper to the work, but has added numerous fragments drawn from other sources, especially those occurring in the *Scholia* of Et-Tebrīzī, as well as the *Mo'allaqahs* of Zuheyr and 'Antarah, the *Lāmiyyeh* of Esh-Shefērā, and the *Banet So'ad* of Ka'b son of Zuheyr. No such faithful interpretation of the ways and thoughts of the ancient Arabs exists to our knowledge in any modern European language; it is comparable, for fidelity, spirit, and fluency, only to Lauc's translation of the *Thousand and One Nights*.

When the *Hamāseh* is spoken of, that of Abū Temmām, as the first and most famous of the name, is meant; but several collections of a similar kind, also called *Hamāseh*, exist. The best known and earliest of these is the *Hamāseh* of El-Bohtarī (died 284 A.H.), of which some fragments were published by Theo. Noldeke in his *Beiträge zur Kenntniss der Poesie der alten Araber* (Hanover, 1864). Four other works of the same name, formed on the model of Abū Temmām's compilation, are mentioned by Hāji Khalīfeh. Besides these, a work entitled *Hamāseh er-Rih* (the *Hamāseh* of wine), was composed by Abu-l-'Alā el-Ma'arri (died 449 A.H.). (C. J. L.)

HANBATO, a form of the name AMBATO (*q.v.*).

HAMBURG, a state of the German empire, which consists of the city of Hamburg with its incorporated suburbs of St George's and St Paul's, the surrounding district with the sixteen suburban hamlets (*Vororte*), several islands in the Elbe, the five enclaves of Volksdorf, Hainsdorf, &c., in Holstein, the communes of Moorburg in Lüneburg and Cuxhaven-Ritzbüttel in the north-west of the duchy of Bremen at the mouth of the Elbe, the island of Neuwerk

about five miles from the coast, and the bailiwick (*amt*) of Bergedorf, which up to 1867 was held in common by Lübeck and Hamburg. The whole territory has an area of 157·18 square miles, exclusive of 99 square miles occupied by the Elbe. Of this area 124 square miles are within the limits of the German customs, but the rest continues to be practically "abroad" in relation to the commerce of the empire. In 1871 the total population was 338,974; by 1875 it had increased to 388,618 (191,339 males and 197,279 females); by 1877 to 406,014; and by 1878 to 417,239. Administratively the state is divided into the city or metropolitan district, which had 239,107 inhabitants in 1871, the domain of the Geestland¹ with 57,216 inhabitants, the domain of the Marschland with 22,982, the bailiwick of Bergedorf with 13,112, and the bailiwick of Ritzebüttel with 6557. Cuxhaven-Ritzebüttel and Bergedorf are the only towns besides the capital, and they had respectively 4102 and 3899 inhabitants in 1875. The Geestland comprises the suburban districts of Rotherbaum, Harvestehude, Eimsbüttel, Eppendorf, Hohenfelde, Uhlenhorst, Eilbeck, Barmbeck, Winterhude, Borgfelde, Harum, and Horn, which encircle the city on the north and east; and the Marschland includes various "werders,"² such as the Billwerder Ausschlag to the east of the city, the Steinwerder and the Little Grasbrook to the south of the Elbe, the Billwerder, the Ochsenwerder, and the so-called Vierlande or Four Districts (Corslake, Altegamme, Nauegamme, and Kirchwerder) as far east as Geesthacht. While the Geestland has in many places an almost unproductive soil, the Marschland is of extraordinary fertility, and its pastures, corn-fields, and market-gardens furnish Hamburg with large quantities of country produce.

As a state of the empire Hamburg is represented in the federal council by one plenipotentiary and in the diet by three deputies. According to the present constitution, which has been in force since September 28, 1860, the legislative power is in the hands of the senate and the general body of citizens, and the executive is committed to the senate alone. Of the 18 members of the senate no less than 9 must have studied law and finance, and of the remaining 9, 7 must be representatives of commerce. The members are chosen by the senate and the burgesses after a complicated process, and the burgess upon whom their choice falls is obliged to accept office for at least six years, on pain of losing his civic rights. The senate by itself has the election of the first and the second burgomaster, each of whom holds office for only a year. There are 196 burgesses, of whom 88 are chosen by ballot by the general community, 48 by and from the owners of ground within the town, and 60 by the courts and administrative bodies. They are elected for a period of six years, but as half of each class go out at the end of every three years the elections occur twice as often. Both the senate and the burgesses have the right of introducing new bills. The basis of the civil law is the *Jus Hamburgicum*, revised in 1603 and supplemented by the Roman law; but in some of the rural districts local customs prevail, and in Bergedorf the Lübeck rights are still partly in force. Hamburg has appeal to the common high court of the Free Cities in Lübeck. There is a special court for commercial disputes. Juries are summoned in the more important trials; and since 1869 there has been public and responsible prosecution of criminal cases. The ecclesiastical arrangements

¹ Geest is a Platt-Deutsch word signifying "dry," and the Geestland is consequently the higher and drier district, in contrast to the marsh-land. The surface of the Geestland is composed of sand and gravel, and part of it is occupied by heath.

² Werder, Wärd, or Wörd is either equivalent to the old English "holm," a river-island, or signifies a stretch of flat land between a river and a piece of standing water, or a portion of a swamp drained and devoted to tillage.

of Hamburg have undergone great modifications since the general constitution of 1860. From the Reformation to the French occupation in the beginning of this century, Hamburg was a purely Lutheran state; according to the "Recess" of 1529, re-enacted in 1603, non-Lutherans were subject to legal punishment and expulsion from the country. Exceptions were gradually made in favour of foreign residents; but it was not till 1785 that regular inhabitants were allowed to exercise the religious rites of other denominations, and it was not till after the war of freedom that they were allowed to have buildings in the style of churches. In 1860 full religious liberty was guaranteed, and the identification of church and state abolished. By the new constitution of the Lutheran Church, published at first in 1870 for the city only, but in 1876 extended to the rest of the Hamburg territory, the parishes or communes are divided into three church-districts, and the general affairs of the whole community are entrusted to a synod of 53 members and to an ecclesiastical council of 9 members which acts as an executive. A central fund for the church was formed in 1870 out of the surplus property of the convent of St John; and in some of the communes there is a church rate. According to the returns of 1871 there were 300,968 Lutherans, 5585 members of other Evangelical Churches, 7771 Roman Catholics, 194 Mennonites, 2696 Christians of other sects, and 13,796 Jews, while 628 described themselves as without religion or heathens, and 7071 gave no information as to creed. Since 1871 the ratio of Lutherans to non-Lutherans must have somewhat diminished. The German Reformed Church, the French Reformed, the English Episcopal, the English "Reformed," the Roman Catholic, and the Baptist are all recognized by the state. Civil marriages have been permissible in Hamburg since 1866, and since the introduction of the imperial law in January 1876 the number of such marriages has greatly increased.

The finances of the state of Hamburg are in a generally satisfactory state; for, although the public debt has been increasing, this is due mainly to such undertakings as railways, harbour improvements, and schools. In 1876 the revenue was estimated at £1,206,161 sterling, in 1877 at £1,264,585, in 1878 at £1,330,550, and in 1879 at £1,384,630; and the corresponding expenses were stated at £1,288,503, £1,358,915, £1,422,175, and £1,507,860. The public debt, which was £6,385,042 in the end of 1874, was reduced by 1878 to £5,325,853. Of the former sum £1,457,775 was the remains of the great conflagration loan of 1842, which originally amounted to £2,550,000.

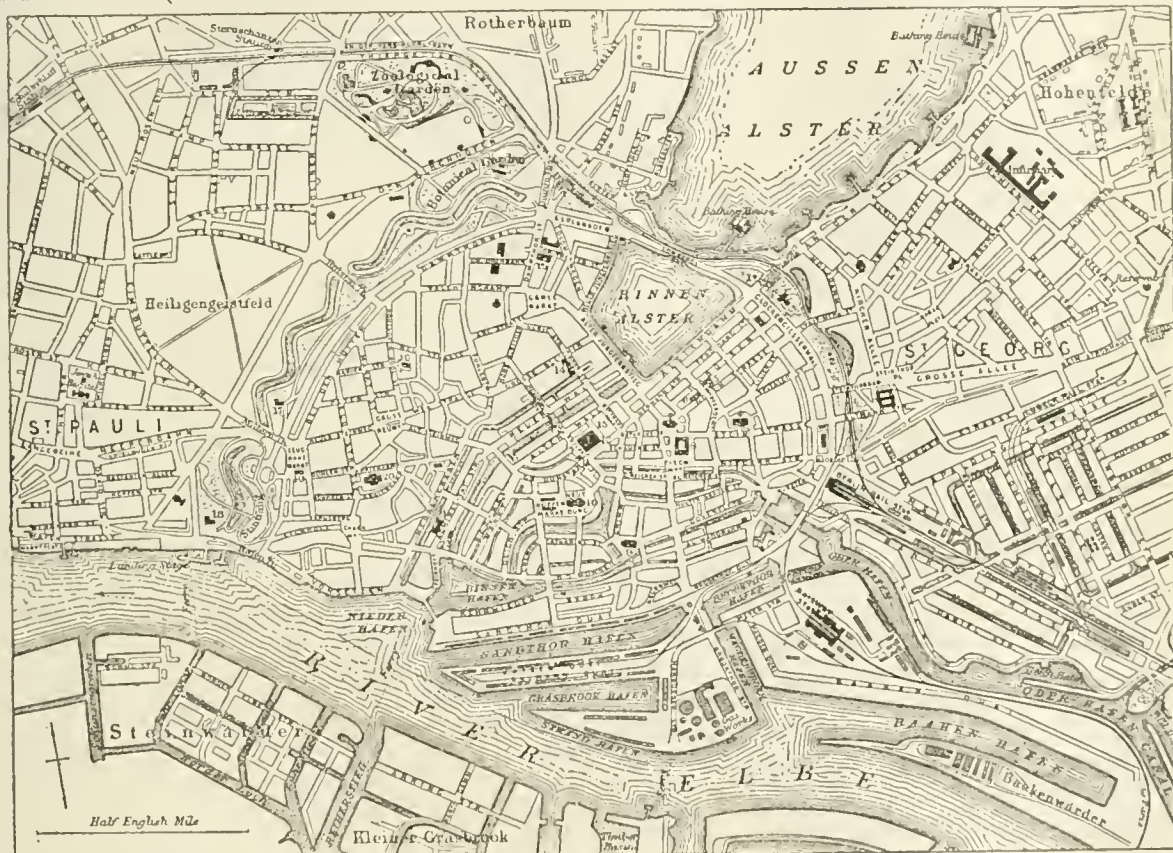

In 1868 the old civic militia, which then consisted of 7354 men, was dissolved; all citizens and inhabitants between the ages of 20 and 45 had been obliged to serve except certain state officials, and school teachers, &c. By convention with Prussia, Hamburg furnishes two battalions to the 2d Hanseatic infantry regiment.

See *Statistik des Hamburgischen Staats*, 1878: J. Nessmann, *Statist. Handbuch für den Hamb. Staat*, 1874 and 1876; Gustav Ritter, *Zehn Jahre Civilstandsamt in Hamburg*, 1876.

HAMBURG, one of the most remarkable cities of Germany and indeed of Europe, ranking as it does as the first of all the seats of commerce on the Continent, is situated on the right bank of the northern arm of the Elbe, about 93 miles from the mouth of that river, just where it is joined by the Alster and the Bille. The latitude of the observatory in the western part of the city is 53° 33' 55" N. and the longitude 9° 58' 23·6" E., the latitude of the tower of St Michael's 53° 32' 55·7" N. and the longitude 9° 58' 41·7" E. Were it not for political and municipal boundaries Hamburg might be considered as forming one town with Altona and Ottensen, the three presenting to the river a continuous frontage of nearly 4 miles; and long lines of suburbs radiate inland in various directions. The city proper lies on both sides of the Alster, which having been dammed up a short distance from its mouth now forms a considerable lake, of which the southern portion within the line of the fortifications bears the name of the Inner Alster (*Binnen-Alster*), and the other and larger portion (2300

metres long and 1200 metres wide at the widest) that of the Outer Alster (*Aussen Alster*). The fortifications as such were removed in 1815, but they have left their trace in a fine girdle of green round the city, though too many inroads on its completeness have been made by railways and roadways. The oldest portion of the city is that which lies to the east of the Alster; but, though it still retains the name of Altstadt, nearly all trace of its antiquity has disappeared, as it was rebuilt after the great fire of 1842. To the west lies the new town, incorporated in 1678; beyond this and contiguous to Altona is the quondam suburb of St Paul's, incorporated in 1876, and towards the north-east is the quondam suburb of St George, which arose in the 13th century, but was not incorporated till 1868. The old town lies low, and it is traversed by a great number of narrow canals or "fleets" (for the same word which has left its trace

in London nomenclature is used in the Low-German city), which add considerably to the picturesqueness of the meaner quarters, and serve as convenient channels for the transport of goods. They generally form what may be called the back streets, and they are bordered by warehouses, cellars, and the lower class of dwelling-houses. As they are subject to the ebb and flow of the Elbe, at certain times they run quite dry, and afford a field of operations for the *fleetenkieker*, who wanders along the oozy channel to pick up any articles of value, and at other times they are filled 15 to 20 feet above their ordinary level.¹ As soon as the telegram at Cuxhaven announces high tide three shots are fired from the Stintfang at the harbour to warn the inhabitants of the "fleets"; and if the progress of the tide up the river gives indication of danger, other three shots add emphasis to the warning. Then the dwellers on the lower levels make a rapid escape

Plan of Hamburg.

with their property. At the time of the equinoxes the inundation may be repeated for several days in succession; but when aH is over the people (the Lüd von de Waterkant) return like rats to their oozy and dripping abodes. In fine contrast to the dull and dismal fleets is the bright and handsome appearance of the Inner Alster, which is enclosed on three sides by handsome rows of buildings, the Alsterdämm in the south-east, the Old Jungfernstieg in the south-west, and the New Jungfernstieg on the north-west, while it is separated from the Outer Alster by part of the rampart gardens traversed by the railway which unites Hamburg with Altona. These streets and especially the Old Jungfernstieg are fashionable promenades. The largest of the public squares of Hamburg is the Hopfenmarkt, which contains the church of St Nicholas, and is the principal market for fish, meat, vegetables, and fruit;

others of importance are the Gänsemarkt or Goose Market, the Zeughausmarkt, and the Great New Market. The churchyards, of which several are pleasantly laid out, are all to be removed to Ohlsdorf, about 4 miles from the town.

Of the churches actually existing in Hamburg (the old cathedral had to be taken down in 1805), St Peter's, St Nicholas, St Catharine's, St James's, and St Michael's are those that give name to the five old city parishes. The church of St Nicholas is remarkable more especially for its tower, which until the spire of the Cologne cathedral reaches its projected elevation of 511 feet, will probably continue to be the second highest building in the world, rising as it

¹ In 1843 *pegels* or water-gauges were established at Hamburg and Cuxhaven. In 1872 their zeros were lowered respectively 9'80 and 4'31 ft., so that they both stand 9'6 ft. above the zero of Harburg and 10'7 above that of Kiel.

goes to a height of 473 feet, about 19 feet lower than St Ouen's at Rouen. The actual church dates from 1845-1874, the former St Nicholas having perished in the great fire. It was opened for public worship in 1863. The architect, the late Sir G. Gilbert Scott, selected the rich Gothic style of the 13th century; and both the exterior and interior are elaborately adorned with sculptures. Sandstone from Osterwald near Hildesheim was used for the outside, and for the inner work a softer variety from Postelwitz near Dresden. The roof is wholly constructed of wood. A large part of the cost, which altogether amounted to £204,220, was defrayed by weekly shilling subscriptions. St Michael's has a tower which almost rivals that of St Nicholas, as with its height of 428 feet it ranks ninth in the list of loftiest buildings in the world. It was erected by Ernst G. Sonnin between 1750 and 1762, on the site of the older building of the 17th century destroyed by lightning; and it not only surpasses all the other churches of Hamburg in size, being 229 feet long and 179 feet broad, but produces a fine effect by the colossal proportions of its four principal pillars. St Peter's church, originally consecrated in 1352, fell a prey to the great conflagration, but it was rebuilt by Chateaufort in 1844-1849. The ring on the door of the tower (which dates from 1342) is considered the oldest artistic relic in Hamburg; and the granite columns of the old cathedral, the stained glass windows by Kellner of Nuremberg, and Schubert's Entombment of Christ are worthy of notice. St Catharine's and St James's are the only churches of Hamburg that have been preserved from the Middle Ages, but otherwise neither is of special interest. Of the other churches it is sufficient to mention St George's, built in 1743, St Paul's in the suburb of that name, the lesser St Michael's occupied by the Roman Catholics since 1824, and the English Episcopal church dating from 1838. The new synagogue was built by Rosengarten between 1857 and 1859, and to the same architect is due the sepulchral chapel of John Henry Schröder in the churchyard of St Peter's. The beautiful Gertrude's chapel was unfortunately destroyed in 1842.

Though Hamburg has comparatively few secular buildings that are of high architectural interest, its list of public institutions is one of which any city might be proud, and several of these are accommodated in spacious structures not unworthy of their destination. The exchange is one of the most important. It was erected on the site of the Mary Magdalen convent in 1836-41, and escaped the catastrophe of 1842. At the business hours between 1 and 3 o'clock as many as from 3000 to 5000 merchants and brokers congregate within its walls. The commercial library in the new wing added in 1873 has upwards of 40,000 vols. In the same neighbourhood are the Hamburg bank and the site of the old rathaus, which had to be blown up in the great fire. The town-house, built by Götz, minister of finance to Charles XII. of Sweden, was purchased by the town in 1722. The academic gymnasium, founded on 16th August 1610 as a preparatory school for the universities, has since 1873 surrendered its teaching functions, though it still maintains public lectures to which all have access, and is in more or less close connexion with the botanic gardens, the natural history museum, the observatory, the chemical laboratory, and the museum of *Culturgeschichte*. The present botanical gardens, which had been preceded by Veit Scharp's (1547-1732) and Flugge's (1810-1813), were laid out by Dr Lehmann on the glacis of the fortifications, and contain about 11 acres. The natural history museum was founded in 1843, and in 1875 the sum of 1,200,000 marks from the Hamburg share of the French indemnity was assigned for the purpose of supplying better accommodation for its valuable collections, amongst which may be mentioned that from Heligoland and that of Griesbach from South Africa. The observatory, dating from about 1826-1828, is a noteworthy institution. It possesses a great equatorial telescope made by Repsold & Sons in 1860, the object glass of which has an aperture of 9.6 Paris inches, with a focal distance of only 9.6 feet; and among its contributions to science are Helmer's observations on the constellation of Sobieski's Shield (1874), and the determination of all the stars down to 9.5 magnitude in the zone between 80° and 81° of N. declination. In connexion with the observatory a time-ball on the tower of the Kaiserquai is caused to fall at 12 o'clock of Greenwich time; there is a similar

ball at Cuxhaven, and another at Bremervaven. The chemical laboratory was built in 1841. It was not till 1866 that the ethnographical collections were put under special curators; and the name *Culturgeschichtliche Museum* only dates from 1872. The principal medical institution in the city is the college of surgeons, founded in 1771 as a general school for doctors and midwives; it received its present constitution in 1833, and was furnished with new buildings in 1861. It was not till 1867, however, that the guild of barbers, with its right of surgical practice, was abolished. The medical union established by H. de Chauffepié about 1815-1816 has published several periodical works, and possesses a library of 12,000 vols. A mathematical society was founded by Heinrich Meissner as early as 1690, the Hamburg-Altona Society for natural science dates from 1837, the Hamburg-Altona branch of the German Anthropological Society from 1870, and the Hamburg branch of the German and Austrian Alpine Club from 1875. A geographical society, which publishes a journal, was founded in 1873; and the firm of Godeffroy, which trades so extensively in the Pacific, has instituted a museum, and sent out scientific explorers and collectors.—Dr E. Gräff, Amalie Dietrich, Johann Kubary, Andrew Garrett, Franz Hübner, &c.—the results of whose labours are registered in the *Journal des Muséum Godeffroy* (1871, &c.). Zoological gardens were founded in 1860-1 by a joint-stock company, and an aquarium has since been added under the superintendence of Alfred Lloyd of the Sydenham Crystal Palace. Two of the old monasteries of the town—the St Johanniskloster and the St Maria Magdalenenkloster are still maintained as foundations for the daughters and widows of Hamburg citizens, and the former has funds beyond its requirements. The general infirmary (*allgemeine Krankenhaus*) dates originally from 1606, but the present building was erected in 1825-27, and has since received several additions. The annual number of patients increased between 1825 and 1875 from 2398 to 8206. The subvention from the state rose in the same period from £8400 to £23,182, and the average daily cost of each patient from 9d. to 1s. 9d. A lunatic asylum (Friedrichsberg) was founded in 1841 at Barmbeck at a cost of £2540 for the site and £66,086 for the building. Its patients numbered 212 in 1865 and 492 in 1875. Among minor establishments of a similar class are the sailors' infirmary (1863), the St Mary's hospital founded by the Romau Catholic community on the occasion of the Danish war in 1864, but open to patients of every creed, the infirmary of the German Jews built by Solomon Heine in 1840, the infirmary of the freemasons, the children's hospital dating from 1846-7, the polyclinic of the patriotic association for the assistance of women (1872), the deaf and dumb institution (1827), and the blind asylum (1830). The orphanage originated in 1606 by Gillis de Greve and Simon von Petkun, admits about 64 children every year. In the beginning of July the orphans, in their bright blue out-door dress, make a procession through the city and the suburb of St George, and the day, known as the Waisengrün, is considered a popular holiday. In the suburban village of Horn is the famous Rauhe Haus, and at Alsterdorf there is a home founded in 1860 for idiots and children suffering from incurable diseases. It had 273 inmates in 1875. The workhouse, which dates from the beginning of the 17th century, has been situated since 1853 in the village of Barmbeck, and since 1869 has had a branch establishment at Fuhlsbüttel. In 1875 it had 1342 inmates, and its revenues were £17,332, besides a state subvention of £20,417. The annual cost per head is £14, 15s. About 200 free dwellings and a number of pensions are provided by the Schröder foundation for respectable families and individuals in reduced circumstances.

Hamburg is well supplied with places of amusements, especially of the more popular kind. Its town theatre, rebuilt in 1874, has room for 1750 spectators; the Thalia theatre dates from 1841, and contains 1700 to 1800; and there are some 7 or 8 minor establishments. Theatrical performances were introduced into the city in the 17th century, and 1678 is the date of the first opera, which was played in a house in the Gänsemarkt. Under Schröder and Lessing the Hamburg stage rose into importance.¹ Though contributing few names of the highest rank to German literature, the city has been intimately associated with the literary movement. Lappenberg and Hagedorn were born in Hamburg; and not only Lessing, but Heine and Klopstock lived there for some time. In Schröder and Klotze's *Lexicon der Hamburg. Schriftsteller* there are no fewer than 3536 names up to Schroll; and the library of the society for the encouragement of art and science contains 5000 volumes dealing with Hamburg affairs.

The inhabitants of Hamburg used formerly to have no small variety of distinctive costumes; but it is only the public officials in their robes of state or the peasantry from the villages that preserve the more grotesque peculiarities.²

¹ See Uhde, *Das Stadttheater in Hamburg*, Stuttgart, 1879.

² Details and coloured designs will be found in Sulir and Hubbe's *Hamburger Ausruf* (which gives 1807 styles) and in Buek's *Album Hamburgischen Costüme* (Hamb. 1843-47). Of the local dialect a knowledge may be obtained from Michael Richey's *Idiotikon Hamburgense, oder Wörterbuch zur Erklärung der eigenen und um Hamburg gebräuchlichen Niedersächsischen Mund-Art* (1743 and 1755), and Gefken's *Die Hamburgischen Niedersächsischen Gesangsbücher des 16ten Jahrhunderts* (Hamb. 1857).

The oldest water-works of Hamburg were those of the Oberdamm, constructed in 1531; the first of the modern system with steam power was the Bieber'sche Elbwasserkunst, opened in 1822. In 1849 the city water-works belonging to the state were set in operation, and they have since incorporated and systematized the older water-works. In 1875 they had 5 steam-engines with 850 horse-power, and raised 876 millions cubic feet of water at a cost of about 8d. per 1000 cubic feet. It was not till after the fire of 1842 that Hamburg began to be properly drained; but it now possesses an extensive and elaborate system of sewers. In 1853 the upper Old Town, the New Town, and St. George's were supplied, and in 1859 the lower Old Town; and between 1871 and 1875 the system was extended to the aristocratic suburban districts of Uhlenhorst and Eimsbüttel. In 1875 the total length of sewers was 512,226 feet, which had cost £662,850. The largest sewers, of which there were 10,499 feet, have a diameter of nearly 10 feet, and can be traversed by boats; the second class (8330 feet) have a diameter of 7 feet, and the third class (19,853 feet) of 5½ feet. The mouths of the sewers are protected by automatic doors which prevent the flooding of the lower districts by the back-water from the river.

The harbour of Hamburg as it now exists is a very modern creation. At first the city was at some distance from the main branch of the Elbe, and the mouth of the Alster served as its port, but partly owing to natural changes in the bed of the great river, and more to the vast engineering enterprises of the inhabitants,—such as the cutting of the channels through the Grandeswerder (1650), the Spandeland marshes (1570), and the Brook,—the principal current was diverted into its present course. To trace the history of the successive labours devoted to the rectification of the stream and the increase of shipping accommodation would be a long and intricate task. Sufficient to say that up to the middle of the present century the vessels in the harbour of Hamburg used to anchor in the open space and fasten themselves to piles called "dukes of Alba," and the goods were taken ashore in lighters; but since the introduction of the railway it has been found necessary to build quays with hydraulic cranes and other modern appliances. For this purpose the greater Grasbrook was first of all selected. A portion of the Sandthor (Sandgate) quay was opened in 1872, and by 1876 the Kaiser or Imperial quay and the Dallmann quay (so named after the engineer) were available. The total length of the three quays was 10,546 feet, and the area of ground covered in by the auxiliary buildings was upwards of 30 acres. Since that date the quays have been largely increased, so that they now extend a distance of about 3 miles from Altona eastwards. The number of ships which took advantage of the quays in 1866-67 was 665, with a burthen of 313,269 tons; by 1875 they had increased to 1425 ships with 937,568 tons, and by 1878 to 1850, with 1,151,903 tons.

Hamburg is emphatically a commercial city, and though within recent years greatly developed, its manufacturing industries are in comparison unimportant; but only in comparison, for, according to the official return of 1875, no fewer than 4931 persons were engaged in metallurgy, 5926 in the manufacture of machinery, instruments, and tools; 940 in chemical works, 1399 in the preparation of heating and lighting materials, 1464 in textile industries, 2687 in the paper and leather manufactures, and 9388 in the wood industries. Ship-building is carried on pretty extensively, the greatest establishment in the department, the Reiherstieg or Godeffroy's yards, which was commenced about 1849, employing on an average 700 workmen. There are several enormous distilleries, and two establishments for the manufacture of artificial manures from the phosphates of guano, each of which employs from 200 to 300 workmen; as well as breweries, sugar-refineries, rice-mills, and factories for the preparation of saltpetre, sulphuric acid, and other chemical products. The curing of beef and pork forms a large trade. Pianofortes and cigars, railway carriages and artificial flowers, sewing-machines and chocolate are all manufactured in the town, and tile-works and glass-works exist in the neighbourhood.

In the extent of its commerce Hamburg ranks among European ports immediately after London, Liverpool, and Glasgow. Its imports and exports are more than those of the whole of Holland, of Belgium, or of Spain. From the year 1836, in which it possessed 146 ships, with a total burthen of 25,722, its marine had increased 770 per cent. by 1877. In 1875 it had 443 sea-vessels with 219,567 tons burthen; in 1876 it had 450 with 219,698 tons, and in 1877 468 with 223,910. Of the last number 264 were copper-plated, 6 were zinc-plated, and 147 were built of iron. The steam vessels were 102. The principal line of steamers is that of the Hamburg-American Company, which on 1st January 1876 had 21 first-class British-built vessels, with a total burthen of 60,300 tons. Its voyages are mainly made to New York and the West Indies. On an average of the three years 1874, 1875, and 1876 it carried 31,930 passengers and 165,465 cubic yards of goods. The Hamburg and South American Company at the same time had six vessels, with a burthen of 8000 tons, trading with Brazil and the river Plate. The German Steamship Company had 8 vessels with a burthen of 6,850 tons trading with

China and the Far East; and the Kosmos Company had 7 ships with a burthen of 10,897 tons trading with Chili and Peru. The Slesman or Mediterranean line of six vessels with a burthen of 5276 tons keeps up monthly communication with ports of Spain and Italy.

From the following table a general view of the movement of the port will be obtained. It is to be observed that the increase shown is not so much in the number of the ships as in their average capacity.

	Ships Entered.	Register-Tons.	Ships Cleared.	Register-Tons.
1865	6186	1,223,403	6186	1,216,499
1866	6185	1,327,673	5210	1,332,563
1867	6055	1,431,082	6071	1,434,563
1868	6287	1,532,665	6287	1,528,844
1869	6192	1,603,812	6201	1,595,016
1870	4144	1,359,789	4101	1,376,178
1871	6439	1,837,505	6457	1,866,781
1872	6913	2,650,913	5672	2,075,472
1873	6270	1,887,037	6363	1,904,050
1874	6225	2,094,102	6238	2,100,193
1875	6260	2,117,824	6209	2,084,748
1876	6483	2,228,162	6461	2,247,129
1877	6473	2,233,923	6469	2,243,500

The average consequently for the years 1866-1875 was—ships entered 5198, tonnage 1,735,242; ships cleared, 5202, tonnage 1,731,973.

The following table shows the imports (in centners of 110 lb) into Hamburg in 1878, first from non-European, and secondly from European countries:—

Non-European.		European.		
Coffee	1,015,200	405,280	Petroleum	815,050
Tea	14,030	38,400	Train oil	13,360
Sugar	117,460	137,260	Palm oil	53,350
Tobacco	264,490	130,950	Cocoa-nut oil	5,920
Rice	780,790	55,550	Palm-nuts	165,260
Grain	611,890	169,050	Cotton	37,460
Rum	130	16,990	Cotton wool	407,290
Herrings	5,250	394,300	Raw and bar iron	2,415,210
Dye woods	574,170	40,340	Rails	31,400
Saltpetre	1,074,510	12,630	Sulphur	105,940
Copper and silver	52,769	6,050	Coal	17,224,534
Guano	1,697,870	95,550	Miscellaneous	8,695,892
Total.....		10,020,050	31,327,960	

Hamburg is an important outlet of emigration, no fewer than 870,000 persons having left Germany by its vessels between 1836 and 1874, or on an average 30,000 every year. In 1874 the number was 42,952; in 1875, 31,787; in 1876, 28,733; in 1877, 22,143; and in 1878, 24,803.

The monetary transactions of Hamburg have long been maintained on a very extensive scale. As early as 1619 the great Hamburg giro-bank was founded on the model of that of Amsterdam, and, in spite of the blow struck by the French in 1813, it continued to flourish till in 1876 it was replaced by a chief office of the German Imperial Bank, which includes in its domain the province of Schleswig-Holstein-Lauenburg, the three Hanseatic towns, and the two grand-duchies of Mecklenburg. In 1876 there were, besides, the North German Bank (1856) with a capital of £2,250,000; the Union Bank (1856), with £1,500,000 capital; the Commercial Bank (1870), with £1,500,000; the International Bank (1870), with £750,000; the Anglo-German Bank (1870), with £1,050,000; the Hypothec Bank (1871), with £75,000; the Exchange (Wechsler) Bank (1872), with £187,500; the Brokers' Bank (1871), with £150,000; the Industrial Bank (1871), with £150,000; the St Paul's Credit Bank, with £150,000; and the People's Bank (1860). The Imperial Office in 1876 had a total turnover of £336,693,950; and in 1875 the North German Bank had 4.3 millions, the Union Bank 270 millions, and the Commercial 170 millions. There are also 7 savings banks, the total deposits in which rose from £846,070 in 1866 to £1,615,626 in 1874. Few departments are of more extensive development than the marine insurance. In the ten years 1834-43 the average value insured was £17,534,487, at an average premium of 1.50 per cent., in the corresponding period 1844-53 it was £24,028,991 at 1.50 per cent.; and in the next period, 1854-63, it reached £45,571,543.

The following table shows the figures from 1864 to 1877:—

	Per cent.		Per cent.		
1864	£47,112,592	1.35	1871	£84,926,889	0.90
1865	40,829,647	1.28	1872	102,816,762	0.93
1866	50,111,960	1.24	1873	90,128,065	1.01
1867	60,377,151	1.25	1874	86,184,299	1.05
1868	68,136,688	1.29	1875	78,817,942	1.11
1869	69,492,244	1.16	1876	91,724,700	1.11
1870	63,415,370	1.12	1877	112,083,625	1.06

It is only within recent years that Hamburg has obtained a fair amount of railway communication. The proposal made about 1840 to construct a line from Hamburg to Lübeck was frustrated by the opposition of the king of Denmark, who feared it would injure the trade between his two towns of Altona and Kiel, which soon afterwards (in 1844) he united by rail. The people of Hamburg were forced to content themselves with a line to Bergedorf (1842), but the

¹ In 1885 it reached the exceptionally high figures, 530 ships of 178,065 tons burthen.

was afterwards extended to Schwerin and Berlin, and a branch line was constructed to Lübeck. The Hamburg-Lübeck direct line was opened in 1865, and in the following year a line was constructed between Altona and Hamburg. Direct communication with Paris by way of Harburg, Bremen, Osnabrück, and Venloo was obtained only in 1872. Though as early as 1862 a scheme was set on foot for such a line, the projectors could not come to terms with the Hanoverian Government, which objected to the duchy of Oldenburg obtaining a share in the advantages of the scheme, and wished to keep to itself the whole authority over the bridges on the Elbe while leaving the cost of their construction wholly to Hamburg. In 1866 the Hanoverian Government was swept away by Prussia, and in 1867 the new rulers formed a treaty for the construction of the line. The two main branches of the Elbe, the north and the south, are crossed by two great bridges on the system named after Lohse, which had never before been employed in Germany. As the soil is unstable, the pillars had to be founded on a bed of concrete 17 or 18 feet thick resting on piles. The Hamburg or north bridge has three spans each 334 feet wide, and the Harburg bridge has four spans. The total weight of iron employed was 84,651 cwts. (36,152 for the one and 48,499 for the other). For internal locomotion the city has a system of tramway lines which run out to Wandsbeck and other neighbouring villages, and a still more extensive omnibus system. Small steamers plying on the Outer Alster give easy access to the places along its shores.

In 1811 the population of Hamburg (*Stadt and Vorstadt*) was 106,983; in 1834 it was 145,419; and by 1861 it had reached 198,214. Its subsequent increase is shown in the following table:—

	1860.	1867.	1871.	1875.	Increase 1866-75.	Per cent.
Inner town and harbour	158,296	160,772	160,989	171,558	13,262	8.4
St George's	30,371	32,423	37,097	43,911	13,540	44.6
St Paul's	29,135	31,775	41,021	49,206	20,071	68.8
	217,602	224,974	239,107	264,675	46,873	21.5

If we include in our survey the suburban hamlets or *Vororte*, and Altona, Ottensen, and Wandsbeck, we find that there were clustered together 458,585 persons. In 1871 the proportion of males to females in the whole Hamburg territory was 100 to 105, and in 1875 it was 100 to 103. The number of females in proportion to the males is much greater among the native than among the immigrant part of the population; and the proportion of natives to immigrants is a steadily decreasing one,—76 per cent. in 1867, 68 per cent. in 1871, and 65 in 1875. Most of the strangers are from the neighbouring parts of Germany: 43,523 in 1871 were from Holstein, 30,945 from Hanover, and 15,686 from Mecklenburg-Schwerin. The following table shows the occupations of the people in 1871:—

	Males.	Females.	Total.
Agriculture	7,483	7,092	14,575
Industries	69,878	65,792	135,670
Trade and commerce	48,701	51,589	100,290
Giving personal service	19,816	18,756	38,572
Other callings	10,370	11,266	21,636
Without calling	8,739	17,913	26,652
Not returned	319	1,200	1,519

The number of marriages, partly in consequence of the changes in the marriage laws, is rapidly increasing (8.29 to every thousand inhabitants in 1861, and 12.26 to every thousand in 1875), and a similar increase is observable in the births.

The death rate varied from 26 to 30 per thousand per annum from 1872 to 1875. Consumption and acute diseases of the respiratory organs are the most prevalent causes of death. Between 1831 and 1873 there were 14 visitations of cholera, by far the most violent being those of 1832 and 1848, which carried off respectively 1652 and 1765 of the population.

History.—Hamburg, or, as the older documents have it, Hammaburg, appears to have taken its rise as a frontier block-house or castle on the Slavonic borders of Germany, which in the 9th century lay thus far to the west. The block-house, which may have been preceded by some insignificant hamlet, was founded by Charles the Great in 808; and he was just on the point of making the newly erected church the seat of a bishopric when he died in 814: His scheme was ultimately carried out by his son Louis the Pious in 831, and three years later a charter was issued at Aix-la-Chapelle and confirmed by Gregory IV. raising the bishopric to the rank of an archbishopric, which was to include not only the surrounding district of Germany, but Iceland, Greenland, and the whole Scandinavian territory. Ansgarius, the first occupant of the see, founded a monastery and a school, but in 837 (or 839 according to other accounts) his labours were rudely interrupted by the Norman pirates, who laid the little settlement in ashes. Other disasters followed: a large portion of the original territory of the archbishopric fell away from its allegiance; and in 1847 it was decided at a synod at

Mainz under the presidency of Hrabanus Maurus that Hamburg should be attached to the bishopric of Bremen, and the seat of the archbishop be in the latter city. The title of archbishop of Hamburg remained in use till 1223, though that of archbishop of Bremen appears as early as the 12th century. All through the 10th century Hamburg continued to suffer from the inroads of the Danes and the Slavonians, and the latter indeed were in possession from 983 to 987. In spite of all the settlement advanced: Archbishop Albrand built a cathedral in 1037, Archbishop Adalbert not long after a castle; and the havoc wrought by Jarl Krulok of Denmark in 1072 was promptly repaired. In 1110 the counts of Schauenburg got possession of Holstein and Hamburg, an event which bore in many ways fruit for centuries after. In return for a contribution to a crusade, Adelf III. obtained for the town from the emperor Frederick I. in 1189 the right of a separate court and jurisdiction, freedom from toll to the mouth of the Elbe, and right of fishing in the river. Merchants from Flanders now began to visit the place, and its importance as a commercial centre was increased by the destruction of the flourishing town of Bardewijk in 1189 by Henry the Lion. After passing under the lordship of Waldemar of Schleswig (1201) and Albert of Orlamünde (1216), it was recovered by the Schauenburg counts, who erected a strong castle over against it (1231). The alliance with Lübeck, commenced in 1241, and consummated by the treaty of 1255, practically laid the basis of the great Hanseatic League, of which Hamburg continued to be one of the principal members. While its foreign relations were thus improved, its internal organization was also rendered more stable by the new constitution of 1270, and the recognition of the municipal autonomy of the counts of Schauenburg in 1292. The domain of the city was increased in the 14th century by the purchase of Eppendorf, Ritzebüttel, &c.; in the 15th the Frisian pirates who had harassed the merchants at the mouth of the Elbe were completely defeated. The claims of the Danish crown to the homage of the city were rejected, and the imperial diet of 1510 under Maximilian I. declared that it was a city of the empire. Not long after two great changes took place. By the so-called "Long Recess" of 1529 the Reformation was introduced, and disagreements with Lübeck set the city free to follow her own path of progress. Through the troubles of the Thirty Years' War Hamburg escaped almost unscathed; but it suffered from the effects of its own bigoted Lutheranism, which drove many of its dissentient religionists forth to become the founders of the neighbouring Altona. In 1603 it received a code of exchange, and in 1615 the first imperial post. Its population was not long after increased and its commerce quickened by a number of the Jews who had been expelled from Spain and Portugal. The course of the 17th century was marked by discord and strife between the senate and the lower classes, which ultimately brought about the interference of the empire and the publication of the "Great Recess" of 1712. Though the courts of the empire had decided in 1618 against the claims of the Danish crown, and had confirmed this decision in 1630 and 1643, Christian V. of Denmark made another attempt to take Hamburg by threat of arms; but he accepted a ransom of 280,000 rixdollars, and at length in 1763 by the treaty of Gottorp the Danish crown renounced all its claims, and in 1770 the delegates of the city took their place in the "Rhenish bench" of the imperial diet. From the Seven Years' War and the war of American independence the commerce of Hamburg drew new life but it suffered terribly during the years of the French ascendancy. The town was not only obliged in 1803 to pay 2,125,000 francs to the Hanoverian estates, but in 1806 it had to admit a French garrison within its walls, and to feel the effects of the British blockade of the Elbe. In 1810 indeed it had the honour of being incorporated in the French empire as the chief town of the department of the "Mouths of the Elbe;" but the retreat of the French commandant Carra Saint-Cyr on 12th March 1813, and the subsequent entrance of the Russian Tenterborn on the 18th, were welcomed by the citizens with joy. But their joy was premature, for by the 30th of May the enemy was again in possession. Davoust, the new general, not only demanded a contribution of 48,000,000 francs, but confiscated the 7,506,956 marks banco (of about 1s. 6d.) at that time in the bank, forced the inhabitants to work at the new fortifications, and drove 20,000 or 30,000 of them out of the city amid the cold of winter. In spite of the attacks of the Russians under Benningsen, Davoust maintained his position till the close of the war. The whole loss of the city from 1806 to 1814 is estimated at £10,500,000 sterling. In 1815 Hamburg became an independent state of the German federation, and formed with Lübeck, Bremen, and Frankfort the curia of the free cities. Its trade rapidly revived, and when in 1842 the great fire destroyed 4219 buildings and rendered nearly 20,000 persons homeless, its credit was sufficient to secure a loan of 34 million marks banco. The old oligarchical constitution had been restored after the recovery of independence; and the internal history of the town from 1840 till 1860 is mainly a protracted contest between the conservative and innovative parties. The year 1858 was remarkable for a great commercial crisis, and for the meeting in the town of the commission of the navigation of the Elbe, and of the delegates appointed by the principal German states to consider maritime law. By the new

constitution of 1861 industrial freedom was introduced, possession of land permitted to strangers, the conditions of settlement greatly modified, and various improvements made in the taxation and duties. At the outbreak of the contest between Prussia and Austria in 1866, Hamburg sided with the former, and in May 1867 it voted 136 to 1 for the constitution of the North German Confederation. It was allowed to remain a free port, but has to pay an aversum to the Zollverein.

Beziehung*, with excellent maps showing profile and relief of site, water and sewer systems, and density of population, for the Gesellschaft der deutschen Naturforscher und Aerzten (Hamb., 1876); Dehio, *Geschichte des Erzbisthums Hamburg-Bremen* (1877, 2 vols.).

HAMELN, the chief town of a circle in the province of Hanover, Prussia, is situated at the confluence of the Weser and Hamel, and at the junction of four railways, 25 miles S.W. of Hanover. It is surrounded by old walls, and possesses a number of old-fashioned houses with quaint richly-adorned gables. The only public buildings of interest are the minster church, restored in 1872, and the town-house. Hameln is the seat of several courts and public offices, and possesses a gymnasium, a higher city school, a higher female school, a trade school, a poorhouse, two hospitals, and a district prison. The principal industries are the manufacture of woollen and cotton goods and machines, distilling, agriculture, and salmon fishing. By the steamboats on the Weser there is communication with Karlsruhen and Minden. In order to avoid the dangerous part of the river near the town a channel was cut in 1734, the repairing and deepening of which, begun in 1868, was completed in 1873. The Weser at Hameln is crossed by an iron suspension bridge 830 feet in length, supported by a pier erected on an island in the middle of the river. The population of Hameln in 1875 was 9519.

The older name of Hameln was Hameloa or Hamelowe, and the town owes its origin to an abbey of St Boniface. It existed as a town as early as the 11th century, and in 1259 it was sold by the abbot of Fulda to the bishop of Minden, but this transaction gave offence to the townspeople, and after a battle in which many of them lost their lives, they placed themselves under the protection of the house of Brunswick. During the Thirty Years' War Hameln was conquered by the Swedes (1633). In 1757 it capitulated to the French, who, however, vacated it in the following year. Its fortifications were strengthened in 1766 by the erection of Fort George, but they were wholly dismantled in 1807. Hameln is famed as the scene of the myth of the piper of Hameln. According to the legend, the town in the year 1284 was so infested by rats as almost to compel the inhabitants to leave it, when one day there appeared upon the scene a piper clad in a fantastic suit, who offered for a certain sum of money to charm all the vermin into the Weser by his piping. His conditions were agreed to, but after he had fulfilled his promise the inhabitants, on the ground that he was a sorcerer, declined to fulfil their part of the bargain, whereupon on the 26th of June he reappeared in the streets of the town, and putting his pipe to his lips began a soft and curious strain, which drew all the children to come trooping after him while he led them out of the town to the Koppelberg hill, in whose side a door suddenly opened, by which he entered and the children after him, all but one who was lame and could not follow fast enough to reach the door before it shut again and remained fast. Some trace the origin of the legend to the "Child Crusade," or to an abduction of children. For a considerable time the town dated its public documents from the event. The story is the subject of a poem by Robert Browning, and also of one by Julius Wolff (3d edition, Berlin, 1876).

HAMI, the Chinese name of a town in Central Asia, otherwise called KAMIL, KOMUL, or KAMUL, situated on the southern slopes of the Tian-Shan mountains, and on the northern verge of the Great Gobi desert, in 42° 48' lat. and 93° 28' E. long., at a height above sea-level of

3150 feet. The town is first mentioned in Chinese history in the 1st century, under the name I-wu-lu, and said to be situated 1000 lis north of the fortress Yü-men-kuan, and to be the key to the western countries. This evidently referred to its advantageous position, lying as it did in a fertile tract, at the point of convergence of two main routes running north and south of the Tian-Shan and connecting China with the west. It was taken by the Chinese in 73 A.D. from the Hiungnu (the ancient inhabitants of Mongolia), and made a military station. It next fell into the hands of the Uigurs or Eastern Turks, who made it one of their chief towns and held it for several centuries, and whose descendants are said to live there now. From the 7th to the 11th century I-wu-lu is said to have borne the name of Igu or I-chu, under the former of which names it is spoken of by the Chinese pilgrim Hwen-thsang, who passed through it in the 7th century. The name Hami is first met in the Chinese *Yüan-shi* or "History of the Mongol Dynasty," but the name more generally used there is Homi-li or Komi-li. Marco Polo, describing it apparently from hearsay, calls it Canul, and speaks of it as a fruitful place inhabited by a Buddhist people of idolatrous and wanton habits. It was visited in 1341 by John de Marignolli, who baptized a number of both sexes there, and by the envoys of Shah Rukh (1420), who found a magnificent mosque and a convent of dervishes, in juxtaposition with a fine Buddhist temple. Hadji Mahomet (Ramusio's friend) speaks of Kamul as being in his time (circa 1550) the first Mahometan city met with in travelling from China. When Benedict Goes travelled through the country at the beginning of the 17th century, the power of the king Mahomet Khan of Kasbgar extended over nearly the whole country at the base of the Tian-Shan to the Chinese frontier, including Kamil. It fell under the sway of the Chinese in 1720, was lost to them in 1865 during the great Mahometan rebellion, and the trade route through it was consequently closed, but was regained in 1873. Owing to its commanding position on the principal route to the west, and its exceptional fertility, it has very frequently changed hands in the wars between China and her western neighbours. As regards the latter quality, it is even now said to yield rice, melons, oranges, and grapes of notable excellence, while, with respect to the former, Baron F. Von Riechthofen (probably the highest authority) states that the route from Hsi-ngan-fu past Hami to Kuldja, is by far the best and indeed the only natural line for a railway from China to Europe. The Russian officer Sosnofski, our latest authority respecting Hami, entered it in the autumn of 1875 after eight days' journey across the Gobi steppe lying to the south. He speaks of it as an important mart, whither wool from Turfan and Turkistan goods are brought to be exchanged for the products of Central China. The Mahometan population consists of immigrants from Jitishahr (or Kashgaria), Bokhara, and Samareand, and of descendants of the Uigurs.

HAMILCAR BARCA, the most illustrious of all the Carthaginian generals and statesmen, next to his son, the great Hannibal. The surname Barca is the same as the Hebrew *Burak*, and signifies "lightning." It was in the eighteenth year of the First Punic War, 247 B.C., that Hamilcar first greatly distinguished himself. He had been known before as a young officer of promise who had made raids on the southern coasts of Italy in the neighbourhood of Locri and Cuma. Suddenly he appeared with a squadron off the north-west of Sicily, and seized a strong position on Mount Ercte, now known as Mount Pellegrino, near Palermo. He had but a small force of mercenaries, which his military genius soon made into a well-disciplined body of troops. For three years he maintained himself on Mount Ercte, during which time the Romans were in

possession of the whole of Sicily with the exception of the two strongholds of Drepanum and Lilybæum, and these they were blockading. They tried their utmost to drive Hamilcar from his position, but in vain. At last he quitted his stronghold, and in 244 B.C. landed at Mount Eryx, on the western coast, now Mount S. Giuliano, 2 miles from the shore and about 6 from Drepanum. A famous temple of Venus crowned the summit, and half-way up the slope was the city, which itself had the name of Eryx. This Hamilcar seized and occupied. His object was to compel the Romans to give up the blockade of Drepanum and Lilybæum. They could not drive him out of the town, and for two more years he held his position, keeping open his communications by sea with the Carthaginian garrison of Drepanum. Hamilcar's chief difficulty was with his mercenaries, who were little better than savages and without an idea of loyalty or good faith. Yet he continued to hold them well in hand. It was a harassing and monotonous warfare, so much so that Polybius, here our chief authority, compares it to a boxing match between two skillful pugilists, the blows in which are delivered in such rapid succession that a spectator could hardly see, much less describe them. The Romans, feeling it necessary to make a supreme effort, in 242 B.C. equipped a fleet, under the command of the consul Lutatius Catulus, and despatched it to the western shores of Sicily. The battle off the Ægates followed, and the Roman victory decided the First Punic War in 241 B.C. Peace had now to be concluded. The cession of Sicily to the Romans was a matter of course. But though Hamilcar had to surrender the island, he refused to comply with the Roman demand that his army should pass under the yoke. The demand was not persisted in, and Hamilcar and his men were allowed to embark from Lilybæum for Africa.

No sooner had peace been concluded than there broke out the so-called African or Libyan War. It was a most formidable mutiny or insurrection. Hamilcar's mercenaries on their return looked for the pay which he had promised them, but had not been able to furnish while he was cooped in within his lines on Mount Eryx. The stupidity of the home Government soon caused trouble. The peace party at Carthage, headed by Hanno, who hated Hamilcar, was foolish enough to raise a dispute about the pay of the troops. The result was a furious mutiny, which Hanno, who was sent to quiet them, could not appease. The men to the number of 20,000 began to march on Carthage itself, and encamped near Tunis. The mutineers were led by Spendius, a fugitive slave from Campania, and by Matho, an African who had served with distinction under Hamilcar in Sicily. These two men incited all the neighbouring tribes to rise against the dominion of Carthage. Carthage itself was soon cut off from all communication with the interior. Hanno was called to take the command, but it was only to meet with defeat and disaster. The rebels surprised and captured his camp. The Government was now thoroughly frightened, and begged Hamilcar to save them from the consequences of their own folly. With a force of only 10,000 men he had to face what must now have grown into a very formidable host. It would seem that his personal influence led many of the rebels to return to his standard, and he was also skillful enough to secure the friendship and aid of the Numidian sheiks. One especially, Naravas, helped him very materially; and with his assistance he was able to achieve a decisive victory over the mutineers. At last he so effectually hemmed in Spendius within his camp near Tunis that the rebel leader was obliged to throw himself on his mercy. With nine of his brother leaders he sought an interview with Hamilcar. Hamilcar's demand was the surrender of ten of the rebels, whom he was to name himself. This being agreed, he

seized Spendius and his nine companions, a proceeding which the mutineers furiously resented. But they were soon surrounded and cut off to a man, to the number, it is said, of 40,000. The war, which had lasted three years and four months, was now over in the year 238 B.C.

One would have supposed that Hamilcar would be at once recognized as the right man to direct the future policy of the state. But it was not so. Hanno's party, the peace party, was as shortsighted as ever, and actually dared to say that Hamilcar had been the cause of the late war by having made promises which he was not able to fulfil. But by this folly they injured and weakened themselves. The patriotic party, the "Barcine faction," as it was called by its opponents, prevailed so far as to raise their leader to a position answering as nearly as possible to a dictatorship among the Romans. Hamilcar was made commander-in-chief of the Carthaginian army in Africa, and invested with a power which could be taken from him only by the popular assembly. He was still a young man, under thirty years of age. For a short time he employed himself in overawing the Numidian tribes bordering on Carthaginian territory, but his main object was to form the nucleus of an efficient army out of his Libyan mercenaries. Meanwhile he was maturing a great plan which soon afterwards on his own responsibility he carried into execution. Spain was a country the coasts of which at least were well known to the Carthaginians. Spaniards too had served among Hamilcar's troops. To Spain he decided to go; there, he felt sure, he could find material for an army and abundant means of providing pay. He had now three sons, the "lion's brood," as he called them, Hannibal, Hasdrubal, Mago. Wishing with all his heart that they should be like minded with himself, he made the eldest, Hannibal, then a little boy of nine, swear on the altar of the supreme Carthaginian deity eternal hatred and enmity to Rome. This was just before he left Carthage, probably in the spring of 236 B.C. Suddenly there came tidings to the home Government that their commander-in-chief was, without their orders, carrying on war in Spain. He had, however, done his work so thoroughly in Africa that the troublesome Numidian tribes were now submissive to Carthage, and for the most part paid tribute. He never returned. The last eight years of his life he devoted to the great work of reducing Spain to a Carthaginian province. He penetrated into the interior of the country, subduing some of the tribes by force of arms and drawing others into friendly relations by negotiation. It was not to mere conquest that he aspired; he did his best to win the good-will of the Spaniards and to attach them to Carthage. Spain was to be a compensation to Carthage for the loss of Sicily and Sardinia. But, above all, its possession was to be subordinate to Hamilcar's great design of some day renewing the war with Rome. For this he would have felt himself prepared when, in addition to his Numidian cavalry, he had organized a force of Spanish infantry. Had his life been prolonged, he would doubtless, as Livy says (xxi. 2), have invaded Italy at the head of a Carthaginian army. What he accomplished in Spain so much impressed the elder Cato, who less than half a century afterwards saw the traces of his work, that he declared that there was no king like Hamilcar Barca. In the prime of his years he fell in battle in 228 B.C., fighting, it would seem, somewhere between the Tagua and the Douro. Spain was now left in the hands of his son-in-law Hasdrubal.

(W. J. B.)

HAMILTON, a municipal and parliamentary borough and market-town of Scotland, county of Lanark, is situated about a mile from the junction of the Avon with the Clyde and 10 miles S.E. of Glasgow. It occupies a rising ground commanding fine views of a rich and highly picturesque country, and consists of several streets of well-built houses.

somewhat irregularly dispersed, and surrounded by a number of villas belonging chiefly to persons engaged in business in Glasgow. The principal buildings are the town-hall, the county buildings in the Grecian style of architecture, the academy, the St John's grammar school, and the infantry barracks. Among the subjects of antiquarian interest are Queenzie Neuk, the spot where Queen Mary rested on her journey to Langside; the old steeple and pillory built in the reign of Charles I.; the Moat Hill, the old Runic cross, and the carved gateway in the palace park. In the churchyard there is a monument, with four heads in basso-relievo, to four covenanters who suffered at Edinburgh, December 7, 1600, their heads being interred below. Among the industries of the town are weaving and the tambering of muslin; and there are also large market gardens, the district being famed especially for its apples; but the prosperity of the town depends chiefly upon the coal and iron-stone which are extensively worked in the neighbourhood. Hamilton originated in the 15th century under the protecting influence of the lords of Hamilton. It unites with Airdrie, Falkirk, Lanark, and Linlithgow to form the Falkirk district of boroughs, which returns one member to parliament. The population in 1871 was 11,498.

Immediately east of the town is Hamilton palace, the seat of the duke of Hamilton and Brandon, premier peer of Scotland. The present palace was commenced in 1822. Its front is a specimen of the enriched Corinthian architecture, with a projecting pillared portico after the style of the temple of Jupiter Stator at Rome, 264 feet in length and 60 feet in height. The interior is richly decorated and contains one of the most valuable collections of paintings in Scotland. Within the grounds, which comprise nearly 1500 acres, is the mausoleum erected by the tenth duke, a structure resembling in general design that of the emperor Hadrian at Rome, being a circular building springing from a square basement, and enclosing a decorated octagonal chapel. About 2 miles south-east of Hamilton, on the summit of a precipitous rock 200 feet in height, the foot of which is washed by the Avon, stand the ruins of Cadzow Castle, the original seat of the Hamilton family, conferred on the chief of that family immediately after the battle of Bannockburn, having been previously a royal residence for at least two centuries. The castle has been made the subject of a spirited ballad by Sir Walter Scott. Near it is the noble chase with its ancient oaks, the remains of the Caledonian Forest, where are still preserved some of the old Scotch breed of wild cattle. Opposite Cadzow Castle on the other side of the Avon is Chatelherault, consisting of stables and offices, and imitating in outline the palace of that name in France. A magnificent double avenue stretches between it and Hamilton palace.

HAMILTON, a city of Canada, the chief town in the county of Wentworth, province of Ontario, is advantageously situated on the south side of Burlington Bay, a large and beautiful basin of water connected with Lake Ontario by a short canal, which forms one of the safest and most commodious harbours on the lake. It is also connected with the town of Dundas by the Desjardins Canal, about 4 miles in length. Hamilton holds an important position at the head of the navigation on Lake Ontario, and in the centre of one of the finest agricultural districts of the Dominion. It is the headquarters of the Great Western Railroad, and is connected by other lines of railway with Lake Erie, Lake Huron, and the Georgian Bay. The site on which it is built rises gradually from the bay to the foot of a lofty bluff called "The Mountain," the summit of which commands an extensive and beautiful view. The streets are well laid out, and planted with shade trees, and the houses and public buildings are substantially constructed of stone and brick. The court-house and county buildings, recently completed, are the finest in Canada. Among the other public buildings are the provincial lunatic asylum, the Anglican and Roman Catholic cathedrals, and handsome places of worship of other denominations, the collegiate institute, the Wesleyan female college, the mechanics' institute, the banks, the city hospital, and other charitable institutions. The city water-works, by means of which a constant supply of pure water is brought from Lake Ontario, have been

completed on a scale amply providing for the future growth of the city, at a cost of about \$1,000,000. The industries include iron rolling mills, iron foundries, the manufacture of agricultural implements, sewing machines, musical instruments, carriages, glass, pottery, &c., tobacco manufacture, and brushmaking. The total value of imports at the port of Hamilton for the fiscal year 1878-9 was \$3,992,123; and the duty collected amounted to \$839,153. The total tonnage entered at the port was 160,666 tons; but this is exclusive of a much larger amount of goods brought by railway, including foreign importations, on which the duty has already been paid at Quebec or Montreal, and of which therefore no entry is made. Daily lines of steamers run in the summer months between Hamilton, Toronto, Kingston, and Montreal; and an extensive trade is carried on with the maritime provinces. Hamilton was founded in 1813, and incorporated in 1833. The population in 1836 was 2846; in 1851, 10,248; in 1861, 19,096; in 1871, 26,716; and in 1879 it is estimated at 35,000. It is the seat of the Anglican bishop of Niagara, and of a Roman Catholic bishop. It returns one member to the provincial parliament of Ontario, and two members to the Dominion parliament, or House of Commons.

HAMILTON, a township and post village of Madison county, New York, U.S., is situated on the Chenango canal, and on the Utica branch of the New York and Oswego Midland Railway, 30 miles S.W. of Utica. The village is the seat of Madison university, chartered in 1846, in connexion with which there are a theological seminary of the Baptist denomination opened in 1820, and a preparatory academy opened in 1832 under the name of Colgate Academy, and chartered in 1853 as the grammar school of the university. The university has 10 professors, has both a scientific and a classical course, and is attended by upwards of 100 students. The other educational institutions are a female seminary and a union graded school. The village possesses a foundry, a tannery, and manufactories of sashes and blinds, doors, waggons, cigars, and cheese. The population of the village in 1870 was 1529, and of the township 3687.

HAMILTON, a city of the United States, capital of Butler county, Ohio, is situated on both sides of the Great Miami river, on the Miami and Erie canal, and at the junction of several railways, 23 miles N. of Cincinnati. The water-power for manufacturing purposes is obtained by an hydraulic canal which secures a fall of 30 feet; and the situation of the city in the heart of the Miami valley, a rich agricultural district, is very favourable to the development of commercial enterprise. It possesses two public parks, twelve churches, two national banks, a complete graded system of public schools, an orphans' home, and a free library. Its industries are of a varied kind, and are represented by paper and woollen factories, flour-mills, foundries, breweries, distilleries, bleaching works, machine shops, and manufactories of carriages and waggons, reaping machines, ploughs, and other agricultural implements, sashes and blinds, railroad supplies, and machinery. Hamilton received a municipal charter in 1853, at which time the portion on the west side of the river formerly called Rossville was incorporated with it. The population, which in 1860 was 7223, and in 1870 11,081, of whom 3062 were foreigners, was estimated in 1879 at 17,000.

HAMILTON, the principal town in the western district of Victoria, Australia, is situated on the Grange Burne Creek, in 37° 45' S. lat. and 142° 1' E. long. It was proclaimed a borough in 1859, the area of the municipality being 5280 acres. It has several elegant buildings—a hospital and benevolent asylum, a town-hall, a treasury and land office, and a public library. Its educational

institutions include the Hamilton and western district college, the academy, and the Alexandra college for ladies, besides a state school with accommodation for 500 pupils. It possesses a fine race-course covering 120 acres, and pastoral and agricultural exhibitions are held annually, the surrounding district being chiefly devoted to sheep-farming. The population of the town and suburbs on the 1st January 1879 was estimated at 4400. The railway from Melbourne to Portland passes through the town

ALEXANDER HAMILTON

ALEXANDER HAMILTON was a native of the Island of Nevis, in the British West Indies. He was born January 11, 1757. On his father's side he was connected with the great clan of the Scotch Hamiltons, famous in Scottish history. Hamilton's mother was of French extraction, and was directly descended from one of those noble old Huguenots, who, after the infamous revocation of the Edict of Nantes by Louis XIV., in 1685, had deserted his native land rather than betray his religion, and had sought a home on one of the Western Isles. The mother of Hamilton, whose maiden name was Faucette, was a woman of rare beauty and intelligence. Her first marriage had been to a man by the name of Lavine, a Dane, but the union proving uncongenial, she sought and obtained a divorce, and afterward married James Hamilton, the father of Alexander. While the boy was very young, his mother died and he was left to the care of relatives, who educated him at Vera Cruz. His father failed in business, and remained impoverished till the time of his death in 1799. Hamilton's schooling did not continue long, but he secured some valuable educational help from a Presbyterian clergyman named Knox. In 1769 he had to relinquish his studies and enter the counting house of Nicholas Cruger at Vera Cruz. Here, when only 14, he was intrusted with the entire care of the establishment during Mr. Cruger's absence in the United States. In 1772 a fierce tornado swept the West Indies. A description of the hurricane and of its consequences appeared in the public journal of the Island of St. Christopher, by an anonymous writer. In this event originated the future greatness and celebrity of Hamilton. When it was discovered that a lad so young, so small, so friendless as Hamilton had penned that powerful article, interest was at once awakened in him. Many friends arose around him who made arrangements to send him to America to complete his education. He began his studies in the United States at the grammar school of Elizabethtown, N. J. From six in the morning till twelve at night he was at his books. In a year he visited Dr. Witherspoon, President of Princeton, and made application to enter the college, stipulating that he should be allowed to advance from class to class, not by the years, but as rapidly as his attainments permitted. This was contrary to the laws of the institution, so he proceeded to New York and entered Columbia college. At the early age of 17, while in Columbia college, he took his place prominently among American orators and patriots.

Resistance to the increasing tyranny of the British crown had already begun. On July 6, 1774, a great assembly of the people was held in the suburbs of the city of New York, determined to take decisive steps against the unjust duty of tax laid on tea. It was on this interesting occasion that Alexander Hamilton, then 17 years of age, ventured to come forward and address the people. His vigor of thought, clearness and precision of language, his force of reasoning, eloquence and pathos, his persuasive power, as well as the singular appropriateness of his delivery, commanded the most intense admiration. "This," says Samuel Schmucker "gave him throughout New York the name of the eloquent collegian." In 1774 he began his literary controversies, and won his second wreath of laurels. Dr. Cooper, President of King's or Columbia college, Dr. Ingles, Dr. Chandler, Dr. Wilkins and Dr. Seabury were on the side of the crown; while Governor Livingston, John Jay and Mr. Hamilton put forth anonymous articles of superior worth and conclusiveness on behalf of the people. The great ability displayed

in these several pamphlets, their calm, sagacious spirit, and the conviction which they carried to every impartial mind, attracted universal attention. The authorship of all these articles was at first attributed to John Jay and Livingston, which goes to show the maturity of Hamilton's mind. The announcement of the fact that Hamilton was one of the authors gave him his second honorable title, "Vindicator of the Congress."

The outbreak of the American war for independence attracted the attention of the whole civilized world. Washington had been chosen commander-in-chief of all the armies of the United Colonies, by the Continental Congress, and in January, 1776, he called a council of war, and a general assault on the British troops about Boston was decided upon. At the same time Hamilton joined an artillery company, and in a few weeks was raised to the rank of "Captain of the New Provincial Company of Artillery." He was at the battle of Brooklyn Heights, and covered the rear in the retreat of Harlem. While superintending the erection of earthworks at that place he met his commander-in-chief, which was the beginning of that faithful friendship between these remarkable men that continued unabated through so many dark years of uncertainty and vicissitude, and through the brighter ones of triumph and splendor which happily succeeded.

On March 1, 1777, Hamilton was justly rewarded for his military services at White Plains and Princeton by his appointment as aide-de-camp and private secretary to Washington, with the rank of lieutenant-colonel. Such was the confidence Washington had in this youth of 21 years. In this position he assisted in arranging campaigns, increasing the support of the army and confirming the unity of the confederacy. Troup says of Hamilton at this time: "That the way he held the pen of our army and General Washington's correspondence is unrivaled in military annals." In the gloomy and wintry scenes of Valley Forge, Hamilton was sent by General Washington to General Gates to induce him to order a considerable detachment of his troops, then at Albany, to the main army.

For Hamilton's services at Monmouth, Washington inserted a high eulogium upon him in his report to Congress, which was afterwards expunged at Hamilton's own request. The young aide-de-camp enjoyed the respect and friendship of the officers of the army. Among his intimate friends were Baron Steuben, Lafayette, Henry, La Luzerne and Du Portail.

In 1780 the American conflict had resolved itself chiefly into a rivalry in financial ability and resources between the mother country and the colonies. Under such circumstances the active and patriotic mind of Hamilton became engaged upon the elaboration of such financial schemes as he supposed would relieve the distress of the country and furnish new munitions of war. He wrote an anonymous letter in which he proposed the plan to establish an American bank, to be chartered by Congress for ten years, and to be called the Bank of the United States. The basis of this institution was to be a foreign loan at £2,000,000 as a portion of the bank's stock; a subscription for \$200,000,000 more, guaranteed by \$10,000,000 of specie, or by a *bona fide* equivalent currency. The bank notes were to be made payable to the bearer in three months at ten per cent. An annual loan of £10,000,000 was to be furnished to Congress by the bank at 4 per cent. When the authorship of this scheme became known, Hamilton received his third title, that of "Founder of the Public Credit of the United States." These letters, addressed mainly to Robert Morris, were not without their effect. A bank, founded on private contributions, amounting to £300,000, was organized. Soon after, Congress established, with little variation from Hamilton's plans, the executive departments in the Federal Government. Hamilton was moved by a generous sympathy for André, when he heard of his arrest, and exerted his utmost efforts to discover some legal and honorable means to save him. When all proved unavailing he wrote and published the facts in the case in a letter to his friend Laurens, which reflects equal credit both upon his great mind and the womanly tenderness of his heart. In 1780, while yet the most sagacious of American patriots were content to dwell on present crises, the superior intellect of

Hamilton was already traveling forward to the future, and brooding over those great national measures which would become essential to the establishment of the national unity, harmony and prosperity. In a letter to the distinguished patriot, James Duane, he discussed in a masterly manner the nature and history of republican governments and the confederacy of states. He described the proposed distribution of the executive departments, the officers of the Federal Government; how to proportion taxes, collect them; and how a national bank might be established, which would prove a permanent source of individual and national wealth. In 1780 Colonel Hamilton was selected by Washington and Lafayette as an envoy extraordinary to France, to procure more extensive and efficient aid, but he declined in favor of his friend, Mr. Laurens, who was going abroad. Hamilton, however, drew up for him the letter of instructions, a difficult task, which was executed with his usual ability.

December 14, 1780, Hamilton was united in marriage with Miss Elizabeth Schuyler, the second daughter of the Revolutionary soldier, General Philip Schuyler. This event took place at Albany, in the 24th year of Hamilton's life. They lived together for twenty-four years, when the bloody hand of one who has not inappropriately been called his assassin ended a career of unsurpassed usefulness and honor, by a violent death.

Shortly after his marriage, Hamilton withdrew from the personal service of Washington on account of a slight rupture between these two friends. In April, 1781, in another letter to Robert Morris, Hamilton boldly asserts the principle that "*it is in a national bank alone, we can find the ingredients to constitute a wholesome, solid and beneficial paper credit.*" The plans suggested by Mr. Hamilton were submitted by Mr. Morris to Congress, and adopted on the 26th of May, 1781. In order to secure a convention of States, Hamilton devoted himself to the composition of a series of elaborate essays, under the title of the "*Continentalists.*" They were the foreshadowing of those articles of unrivaled power which afterward appeared in the *Federalist*, under the name of "Publius." In 1781, Hamilton received a separate command in the army of the United Colonies, and led a gallant charge at Yorktown, where the war for independence was terminated. He then returned to his wife in Albany toward the close of the year 1781, and began the study of law.

The legislature of New York elected Hamilton a representative in Congress, July 22, 1782. He now moved in a sphere signally adapted to his great abilities and was able to incorporate his broad and lofty ideas into that masterpiece of modern statesmanship, the Federal Constitution. He took his seat in Congress on the 25th of November, 1782, of which Elias Boudinot was president. Thirty members composed the body, which held its session in Philadelphia. Madison, Lee, Ellsworth, Clymer, Witherspoon and Sullivan were among the number. At this period Hamilton proposed a resolution in Congress which was honorable both to himself and to its subject. He moved, and it was carried, that "the commander-in-chief be informed that Congress would be always happy to receive his sentiments on political and military affairs of these States, the utility of which they have on so many occasions experienced."

Hamilton acquired in a day what an ordinary student could scarcely compass in a week. It will not be surprising, therefore, to learn that he prepared himself for admission to the bar in the short period of four months, and was licensed as an attorney at the end of that time. Aaron Burr, Hamilton's great and unscrupulous antagonist, is perhaps the only other instance of such rapid admission to the bar. At the time of his preparation for the law, Robert Morris, as a mark of his esteem and confidence, offered Hamilton the responsible office of receiver of the Continental taxes in the State of New York. Through Hamilton's exertions the legislature of New York revised and established a system for raising such a fund within the State as should best suit its purposes and those of the United States; and a system for the more effectual collection of taxes. On the same day of the passage of these resolutions Hamilton was the chairman of the committee on peace arrangements between the States and the mother country, and in this position he reported regarding the department of foreign affairs. The report provided that the secretary of that department should occupy the

position of chief of the diplomatic corps, and that it should be his duty to lay before Congress such plans for conducting the political and commercial intercourse of the United States with foreign powers as might appear to him to be best adapted to promote their interests. After the adjournment of Congress, Hamilton retired in October, 1783, to Albany. Thus at the age of 26 he had been the leading spirit of the great American Continental Congress. In November, 1783, he removed to New York and entered upon a large and lucrative practice in the legal profession. Yet he found time while engaged in his professional pursuits to direct his attention to the financial interests of his own State.

The operation of the Bank of North America proving unsatisfactory, the establishment of a Bank of New York was proposed. The plans were submitted to Hamilton, and he drew up a constitution for it which was adopted. Half a million dollars were subscribed at a single meeting, and he was chosen one of its directors. In Hamilton's relation to negro slavery, which at that early period in American history had not attracted a great degree of attention, a single instance is recorded in the life of Hamilton where he came personally in contact with the subject. In a letter to a friend he says: "I find in one of your Gazettes an association against the slavery of negroes, which seems to me to be worded in such a way as to give no offense to moderate men in the Southern States. As I have ever been partial to my brethren of that color, I wish, if you are in the society, you would move in your own name for my being admitted on the list."

Hamilton took a prominent part in the establishment of the celebrated Society of the Cincinnati. Its membership was composed not only of the American officers then living of all grades, but was extended to the eldest male posterity. On this account it incurred violent popular prejudice, as seemingly intended to create a race of hereditary patricians. Jefferson and Adams denounced the association, but Hamilton delivered an oration in which he strongly upheld it, recommending a few minor changes, and a distinction to be made between honorary and regular members. The society remains to this day an honorable memento of the most glorious era of American history, and its medals bear the maxim: *Omnia reliquit servare republicam; Esto perpetua.* Happily for the fame of Hamilton at that time, the project for the establishment of the Society of the Cincinnati did not originate with him; but, according to Marshall, with Gen. Knox.

In 1787 he was again in the legislature of New York, taking a prominent part in the discussion which arose in regard to excluding from seats in the legislature all persons who were either pensioners or officers of the Federal government, earnestly advocating such exclusion. He devised a plan to build up a great system of public instruction upon comprehensive principles, to incorporate that system into the public policy of the State, and to render it by use an indispensable want of the community. He proposed an institution for public instruction under the form and title of a university, to be known as the "University of the State of New York," and to his energy and enlightened patriotism the city of New York is indebted for the establishment of several of the most useful academies throughout the State.

Hamilton now reached the point, in his remarkable career, where he performed his most important service to his country, and erected a monument to his own fame more honorable and more permanent than fell to the lot of any other American patriot, save Washington alone—the formation and adoption of the Federal Constitution which now unites, governs and protects the Union. The States had been governed by the Articles of Confederation which no longer furnished a solid foundation for the establishment and perpetuity of the government. As delegates to the convention to draw up a new constitution, Chief Justice Yates, Hamilton and Hanson were sent from New York State. Two parties existed in the convention; Hamilton, the Federalist, at the head of one, and Madison, the Radical or Democrat, at the head of the other. Neither party seemed able to harmonize with the other. While discussions on the plan of Edmund Randolph, of Virginia, were going on, Hamilton drew up an elaborate plan of ten articles. This Federal Constitution, drawn up by Alexander Hamilton, as finally adopted and recommended by the convention, secured the approbation of all the States, and went into operation on the first Wednesday in March, 1789. With great truth the profound statesman, Guizot, declares that, "Hamilton must be classed among the men who have best known the vital principle and fundamental conditions of a government. . . . There is ac

in the Constitution of the United States an element of order, of force, or of duration, which he has not powerfully contributed to introduce into it and to give it a predominance."

On the 6th of April, 1789, George Washington was *unanimously* elected President of the United States. He at once appointed Hamilton to fill the most important post at that time in the cabinet, the office of Secretary of the Treasury.

On the 13th of December, 1790, Hamilton submitted to Congress his views in reference to the establishment of a national bank, and from the moment of their incorporation and the formation of the Bank of the United States, parties assumed their perfect forms and principles, and an irreconcilable rupture occurred between Mr. Jefferson and Mr. Hamilton.

The *Federalist* is in reality the production of Hamilton. It is the American classic in political science. The first publication began in the daily journals in November, 1787, and it continued till June, 1788. Mr. Hamilton retired from office after 20 years of public service, during which he had accumulated nothing of a fortune, and again took up the practice of law. Burr and Hamilton were political opponents, and when the former was candidate for governor of the State of New York in 1804, he was defeated through the efforts of Hamilton. This so irritated Burr that he sought and found an excuse for a quarrel, which resulted in a duel on Wednesday, July 11th, 1804, at Weehawken, New Jersey. Hamilton declined to fire at his adversary, but was mortally wounded by Burr's first shot, and died the following day. His remains were buried in New York city.

The premature death of Hamilton was a national calamity. The chief qualities of the mind of Alexander Hamilton were a clear and vigorous reasoning faculty, and a chaste and prolific imagination. In the discussion of any subject he seized hold of the main points with the vigor of an intellectual giant, and handled them skillfully, gracefully and with ease. His essays, pamphlets and reports are masterpieces, each perfect, symmetrical and finished in itself. The eloquence of Hamilton was a model of perfection, whether it was displayed in a deliberative assembly, in the courts of justice, or in the halls of the academy. He was possessed of a retentive memory and clear discrimination, and was gifted with indomitable industry. His integrity and honesty were unimpeachable. As a soldier Hamilton was eminently brave, chivalrous and prudent. The personal appearance of Mr. Hamilton was pleasing and attractive. He was under the middle size, thin in person, and very erect, courtly and dignified in his bearing. His hair was combed back from his forehead, powdered and collected in a cue behind. His complexion was very delicate and fair, and his cheeks rosy. His whole expression was pleasing and cheerful. His forehead was high, capacious and prominent. His voice was musical; his manner frank and impulsive. His appearance and carriage betokened a man of great intellect and one fully conscious of his powers.

HAMILTON, ANTHONY or ANTOINE (1646-1720), a French classical author, who is especially noteworthy from the fact that, though by birth he was a foreigner, his literary characteristics are more decidedly French than those of many of the most indubitable Frenchmen. His father was George Hamilton, younger brother of James, second earl of Abercorn and head of the family of Hamilton, in the peerage of Scotland, and sixth duke of Châtellerault in the peerage of France; and his mother was Mary Butler, sister of the duke of Ormonde. He was born in 1646, but the place of his birth has not been ascertained. According to some authorities it was Drogheda, but according to the London edition of his works in 1811 it was Roscrea in Tipperary county. From the age of four till he was fourteen the boy was brought up in France, whither his family had removed after the execution of Charles I. The fact that, like his father, he was a Roman Catholic, prevented his receiving the political promotion he might otherwise have expected on the Restoration, but he became a distin-

guished member of that brilliant band of courtiers whose most fitting portraiture was destined to be the product of his pen. His connexion with France was always maintained, and the marriage of his sister to the Comte du Grammont, rendered it more intimate if possible than before. On the accession of James he found his religious disabilities transformed into advantages. He obtained an infantry regiment in Ireland, and was appointed governor of Limerick. But the battle of the Boyne, at which he was present, brought disaster on all who were attached to the cause of the Stewarts, and before long he was again in France—an exile, but at home. The rest of his life was spent for the most part in the châteaux of his friends. With the duchess Ludovise of Maine he became an especial favourite, and it was at her seat at Sceaux that he wrote the *Mémoires* that made him famous. The ill-advised expedition of 1708 was the last political enterprise in which he shared, and he died at St. Germain-en-Laye, August 6, 1720.

It is mainly, as has already been indicated, by the *Mémoires du Comte de Grammont* that Hamilton takes rank with the most classical writers of France. The work was first published anonymously in 1713 under the rubric of Cologne, but it was really printed in Holland, at that time the great patroness of all questionable authors. An English translation by Boyer appeared in 1714. Upwards of thirty editions have since appeared, the best of the French being Renouart's (1812) and Gustave Brunet's (1859), and the best of the English Edward's (1793), with 78 engravings, and Malleville's (1811), with 64 portraits by Scriver and others. The original edition was reprinted by Pifteau in 1876. In imitation and satiric parody of the romantic tales which Galland's translation of *The Thousand and One Nights* had brought into favour in France, Hamilton wrote *Le Belin, Fleur d'Épine, Zénéyde*, and *Les Quatre Faucardins*, which are characterized by the graceful ease of their style and the successful extravagance of their incidents. The first three tales appeared at Paris in 1730, ten years after the death of the author, and a collection of his *Œuvres Diverses* in 1781 contained the unfinished "Zénéyde." A collected edition of Hamilton's works was published in six volumes in 1749, and was reprinted in 1762, 1770, 1776, and 1777. A translation of Pope's *Essay on Criticism*, which procured the author a complimentary acknowledgment from the poet, is still in MSS., with the exception of a fragment printed in the 1812 edition of the works. In the name of his niece, the countess of Stafford, Hamilton maintained a witty correspondence with Lady Mary Wortley Montagu. See Notices of Hamilton in the 1862 edition of his works, and in Lesueur's edition of the *Contes, Sainte-Beuve's Causeries du Lundi* (tom. i.), and Sayou's *Histoire de la littérature française à l'étranger*, 1853.

HAMILTON, ELIZABETH (1758-1816), novelist and miscellaneous writer, was born at Belfast, of Scotch extraction, 25th July 1758. Her father's death in 1759 left his wife so embarrassed that Elizabeth was adopted in 1762 by her paternal aunt, Mrs Marshall, who lived in Scotland, near Stirling. There Elizabeth spent her youth and received a good education,—at first at school, afterwards in private, and latterly for some months under masters at Edinburgh and Glasgow. In her 15th year she made a tour in the Highlands with some friends, and wrote a journal of it for her aunt's perusal, which was inserted, unknown to the authoress, in a provincial magazine. In 1780 Mrs Marshall died, and Miss Hamilton was prevented by household cares from using her pen; but in 1785 she made her first voluntary contribution to the press in the shape of a letter to the *Loûnger*, of which paper it forms the 46th number. On the death of Mr Marshall in 1788, Miss Hamilton lived for a time with her brother, Captain Charles Hamilton, who was engaged on his translation of the *Hedaya*. Prompted by her brother's associations, she produced her *Letters of a Hindoo Rajah* in 1796, and soon after, with her sister Mrs Blake, settled at Bath, where she published in 1800 the *Memoirs of Modern Philosophers*, a kind of satire on the admirers of the French Revolution. In 1801-2 the *Letters on Education* appeared, her most valuable though not her most popular work. After travelling through Wales and Scotland

for nearly two years, the sisters took up their abode in 1803 at Edinburgh. In 1804 Mrs Hamilton, as she then preferred to be called, published her *Life of Agrippina, wife of Germanicus*; and in the same year she received a pension from Government. About this time she consented to take charge for six months of a widowed Scotch nobleman's family; and to his eldest daughter were addressed *Letters on the Moral and Religious Principle*, published in 1807. Her next publication of importance, *The Cottagers of Glenburnie*, appeared in 1808. This work, to which the authoress owes most of her fame, is an admirable description of the failings of the Scotch peasantry in their home life, and, while graphic and telling, is "saved from caricature and absurdity." Sir Walter Scott describes it as "a picture of the rural habits of Scotland, of striking and impressive fidelity;" and Lord Jeffrey reviewed it very favourably in the *Edinburgh Review* (vol. xii.). Her subsequent works were a supplement to her *Letters on Education*, under the name of *Popular Essays on the Elementary Principles of the Human Mind* (1812), and *Hints addressed to the Patrons and Directors of Public Schools* (1815). She died at Harrogate, July 23, 1816.

Memoirs of Mrs Elizabeth Hamilton, by Miss Benger, were published in 1818. A notice of her literary life and labours, attributed to Miss Edgeworth, appeared in the *Monthly Magazine* for September 1816.

HAMILTON, JAMES (1769-1831), the author of the Hamiltonian system of teaching languages, was born in 1769 and died October 31, 1831. The first part of his life was spent in mercantile pursuits. Having settled in Hamburg and become free of the city, he was anxious to become acquainted with German and accepted the tuition of a French emigré, General D'Angelis. In twelve lessons he found himself able to read an easy German book, his master having discarded the use of a grammar and translated to him short stories word for word into French. As a citizen of Hamburg Hamilton started a business in Paris, and during the peace of Amiens maintained a lucrative trade with England; but at the rupture of the treaty he was made a prisoner of war, and though the protection of Hamburg was enough to get the words *effacé de la liste des prisonniers de guerre* inscribed upon his passport, he was detained in custody till the close of hostilities. His business being thus ruined, he went in 1814 to America, intending to become a farmer and manufacturer of potash; but, changing his plan before he reached his "location," he started as a teacher in New York. Adopting his old tutor's method, he attained remarkable success in New York, Baltimore, Washington, Boston, Montreal, and Quebec. Returning to England in July 1823, he was equally fortunate in Manchester and elsewhere. His system attracted general attention, and was vigorously attacked and defended. In 1826 Sydney Smith devoted an article to its elucidation in the *Edinburgh Review*:—"We are strongly persuaded," he said, "that, the time being given, this system will make better scholars, and, the degree of scholarship being given, a much shorter time will be needed" than in the ordinary system. As text-books for his pupils Hamilton printed interlinear translations of the Gospel of John, of an *Epitome historicæ sacræ*, of Æsop's *Fables*, Eutropius, Aurelius Victor, Phœdrus, &c., and many books were issued as Hamiltonian with which he had nothing personally to do. The two master principles of his method, which has left its traces on our modern linguistic discipline, are that the language is to be presented to the scholar as a living organism, and that its laws are to be learned from observation and not by rules.

See Hamilton's own account—*The Principles, Practice, and Results of the Hamiltonian System for the last Twelve Years*, Manchester, 1829; Alberte, *Ueber die Hamilton'sche Methode*; C. F. Wurm, *Hamilton und Jacotot*, 1831.

HAMILTON, PATRICK (1504-1528), son of Sir Patrick Hamilton, well known in Scottish chivalry, and of Catherine Stewart, daughter of Alexander duke of Albany, second son of James II. of Scotland, was born in the diocese of Glasgow, probably at his father's estate of Stonchouse in Lanarkshire. Of his early boyhood and education nothing is known. In 1517 he was appointed titular abbot of Ferne, Rossshire; and it was probably about the same year that he went to study at Paris, for his name is found in an ancient list of those who graduated there in 1520. It was doubtless during this period that he received the germs of the doctrines he was afterwards so nobly to uphold. From Ales we learn that Hamilton subsequently went to Louvain, attracted probably by the fame of Erasmus, who in 1521 had his headquarters there. Returning to Scotland, the young scholar naturally selected St Andrews, the capital of the church and of learning, as his residence. On the 9th June 1523 he became a member of the university of St Andrews, and on the 3d October 1524 he was admitted to its faculty of arts. There Hamilton attained such influence that he was permitted to conduct in the cathedral a musical mass of his own composition. But the Reformed doctrines had now obtained a firm hold on the young abbot, and he was eager to communicate them to his fellow-countrymen. Early in 1527 the archbishop Beaton's attention was directed to the heretical preaching of the young priest, whereupon he ordered that Hamilton should be formally summoned and accused. Hamilton fled to Germany, first visiting Luther at Wittenberg, and afterwards enrolling himself as a student, under Francis Lambert of Avignon, in the new university of Marburg, opened May 30, 1527, by Philip, landgrave of Hesse. Frith and Tyndale were among those whom he met there. Late in the autumn of 1527 Hamilton returned to Scotland, bold in the truth of his principles. He went first to his brother's house at Kincavel, near Linlithgow, in which town he preached frequently, and anon afterwards he married a young lady of noble rank, whose name has not come down to us. Beaton, avoiding open violence through fear of Hamilton's high connexions, invited him to a conference at St Andrews. The reformer resolutely accepted the invitation, and for nearly a month was permitted to preach freely. At length, however, he was summoned before a council of bishops and clergy presided over by the archbishop; and though he clearly and calmly answered all the written charges brought against him, his replies gave ground for new accusations of heresy. The council eagerly convicted him, and handed him over to the secular power. The sentence was carried out on the same day (February 29, 1528) lest he should be rescued by his friends, and he was burned at the stake as a heretic. His courageous bearing attracted more attention than ever to the doctrines for which he suffered, and greatly helped to spread the Reformation in Scotland.

Hamilton left a short treatise showing the antithesis between the law and the gospel. Frith's translation of it, under the name of "Patrick's Places," is to be found in Foxe's *Acts and Monuments*. *Patrick Hamilton, the first Preacher and Martyr of the Scottish Reformation*, by the Rev. Peter Lorimer, was published at Edinburgh in 1857.

HAMILTON, ROBERT (1743-1829), an able writer on political economy and finance, was born at Pilrig, Edinburgh, on the 11th June 1743. He was of good family, his grandfather, William Hamilton, professor of divinity and afterwards principal of Edinburgh University, having been a cadet of the family of Preston. He received an excellent education, and specially distinguished himself in the classes of mathematics at the university of Edinburgh, then under Professor Matthew Stewart. Although desirous of following a literary life, he was induced to enter the banking-house of Messrs Hogg in order to acquire a prac-

tical knowledge of business. In 1766 he was disappointed in his effort to obtain the mathematical chair at Aberdeen university, but three years later he gave up business pursuits and accepted the rectorship of Perth academy. In 1779 he was presented to the chair of natural philosophy at Aberdeen university. For many years, however, by private arrangement with his colleague Professor Copland, Hamilton taught the class of mathematics. In 1817 he was presented to the latter chair. For some years before his death in July 1829 he had retired from the active business of his chair, and quitted his privacy only at rare intervals to take part in important affairs concerning the college.

Hamilton's most important work is the *Essay on the National Debt*, which appeared in 1813 and was undoubtedly the first to expose the economic fallacies involved in Pitt's policy of a sinking fund. It is still of value. A posthumous volume published in 1830, *The Progress of Society*, is also of great ability, and is a very effective treatment of economical principles by tracing their natural origin and position in the development of social life. Some minor works of a practical character (*Introduction to Merchandize*, 1778; *Essay on War and Peace*, 1790) are now forgotten.

HAMILTON, THOMAS (1789–1842), the author of *Cyril Thornton*, was the younger brother of Professor Sir William Hamilton, Bart., and was born in 1789. In his early years he acquired a thorough mastery of the classics, and notwithstanding that he entered the artillery and was engaged in active service throughout the Peninsular and American campaigns, he continued to cultivate his literary tastes. On the conclusion of peace he withdrew, with the rank of captain, from active professional duties, and amused his leisure hours with the congenial pastime of literature. He was a frequent contributor to *Blackwood's Magazine* from its commencement, his papers manifesting great variety and versatility of talent, and embracing both prose and poetry. The most important and popular of his contributions to that periodical was the military novel *Cyril Thornton*, whose deficiency of plot is sufficiently compensated for by the interest of its details, its vivacity of movement, its truthful and clever delineation of character, and its easy, fresh, and graceful style. His *Annals of the Peninsular Campaign*, published originally in 1829, and republished in 1849 with additions by Frederick Hardman, though too condensed to leave room for graphic description, is written with great clearness and impartiality. His only other work, *Men and Manners in America*, published originally in 1832, is the result of much careful observation, and its criticisms, though frank and outspoken, and somewhat coloured by British prejudice, are always expressed with courtesy and good taste. He died at Pisa, December 7, 1842.

HAMILTON, SIR WILLIAM, BART. (1788–1856), one of the most eminent of Scottish metaphysicians, was born in Glasgow, on the 8th March 1788. His father, Dr William Hamilton, had in 1781, on the strong recommendation of the celebrated William Hunter, been appointed to succeed his father, Dr Thomas Hamilton, as professor of anatomy in the university of Glasgow; and when he died in 1790, in his thirty-second year, he had already gained a reputation that caused his early death to be widely and deeply regretted. William Hamilton and a younger brother (afterwards Captain Thomas Hamilton, noticed above) were thus brought up under the sole care of their mother,—a woman, fortunately, of considerable ability and force of character. William received his early education in Scotland, except during two years which he spent in a private school near London, and went in 1807, as a Snell exhibitioner, to Balliol College, Oxford. There he pursued his studies zealously, though for the most part independently,—devoting himself chiefly to Aristotle, but in other directions also laying the foundations of that wide and profound scholarship with which his name is associated. In

November 1810 he took the degree of B.A. with first-class honours, after an examination so much above the usual standard in the number and difficulty of the works which it embraced that the memory of it was long preserved at Oxford. He had been intended for the medical profession, but, soon after leaving Oxford, gave up this idea, and in 1813 became a member of the Scottish bar. Henceforward Edinburgh was his place of residence, and, except on occasion of two short visits to Germany in 1817 and 1821, he never again quitted Scotland. Neither his ambition nor his success was such as to absorb his time in professional pursuits. His life was mainly that of a student; and the following years, marked by little of outward incident, were filled by researches of all kinds, through which he daily added to his stores of learning, while at the same time he was gradually forming his philosophic system. The outward and visible traces of these researches remain in his common-place books, especially in one which, having been in constant use, is a valuable record of his studies from this time onwards to the close of his life. He did not withdraw himself from society, but his favourite companions were the books of his own and of every library within his reach. Among these he lived in a sort of seclusion, from which only now and then, when stirred by some event of the world around, did he come forth, in vigorous pamphlets, to denounce, or protest, or remonstrate, as the case might be.

His own investigations enabled him to make good his claim to represent the ancient family of Hamilton of Preston, and in 1816 he took up the baronetcy, which had lain dormant since the death (in 1701) of Sir Robert Hamilton, well known in his day as a Covenanted leader.

In 1820 he was an unsuccessful candidate for the chair of moral philosophy in the university of Edinburgh. Soon afterwards he was appointed professor of civil history, and as such delivered several courses of lectures on the history of modern Europe and the history of literature. In 1829 his career of authorship began with the appearance of the well-known essay on the *Philosophy of the Unconditioned*,—the first of a series of articles contributed by him to the *Edinburgh Review*. He was elected in 1836 to the Edinburgh chair of logic and metaphysics, and from this time dates the influence which, during the next twenty years, he exerted over the thought of the younger generation in Scotland. Much about the same time he began the preparation of an annotated edition of Reid's works, intending to annex to it a number of dissertations. Before, however, this design had been carried out, he was struck with paralysis of the right side, which seriously crippled his bodily powers, though it left his mind wholly unimpaired. The edition of Reid appeared in 1846, but with only seven of the intended dissertations,—the last, too, unfinished. It was Sir William's distinct purpose to complete the work, but this purpose remained at his death unfulfilled, and all that could be done afterwards was to print such materials for the remainder, or such notes on the subjects to be discussed, as were found among his MSS. Considerably before this time he had formed his theory of logic, the leading principles of which were indicated in the prospectus of "an essay on a new analytic of logical forms" prefixed to his edition of Reid. But the elaboration of the scheme in its details and applications continued during the next few years to occupy much of his leisure. Out of this arose in 1847 a sharp controversy with the late Professor De Morgan of University College, London. The essay did not appear, but the results of the labour gone through are contained in the valuable appendices to his *Lectures on Logic*. Another occupation of these years was the preparation of extensive materials for a publication which he designed on the personal history, influence, and opinions of Luther. Here he

advanced so far as to have planned and partly carried out the arrangement of the work; but it did not go farther, and still remains in MS. In 1852-53 appeared the first and second editions of his *Discussions in Philosophy, Literature, and Education*, a reprint, with large additions, of his contributions to the *Edinburgh Review*. Soon after, his general health began to fail. Still, however, aided now as ever by his courageous and devoted wife—(he had married in 1829)—he persevered in literary labour; and during 1854-55 he brought out nine volumes of a new edition of Stewart's works. The only remaining volume was to have contained a memoir of Mr Stewart from his pen; but this he did not live to write. He taught his class for the last time in the winter of 1855-56. Shortly after the close of the session he was taken ill, and on the 6th May 1856 he died at his house in Edinburgh.

Sir W. Hamilton's philosophy is presented in writings either more or less fragmentary in form and occasional in purpose, or else, in whole or in part, prepared for publication by others, not by himself. Hence, not only do some points receive what seems almost a superfluity of attention, while others of equal importance are treated with barely enough of detail, but there is no complete statement of the latest results of his thinking in their mutual relations. It may be that this imperfection of the outward form has tended to obscure the real harmony of his system, and in part led to its being pronounced—as it has too often been—an assemblage of contradictory doctrines. How far this is from being the case, and how closely the various parts are connected, becomes apparent when it is seen how they are all developed from the central conception of consciousness. In the following sketch that conception will be used as a point from which briefly to view the system as a whole, and to trace the bearing on one another of its leading doctrines.

Consciousness is regarded by Hamilton under three chief aspects:—(1) as it is in itself; (2) as realized under actual conditions; (3) as a source of truth.

1. Consciousness in itself is to Hamilton but another name for immediate or intuitive knowledge. For such knowledge is a relation between a subject (knowing) and an object (known), which, as it is viewed from the side of the one or the other term, is properly called consciousness or knowledge: there are two aspects, but the thing itself is one. Immediate knowledge or consciousness involves the existence of both subject and object,—it is the affirmation by the subject implicitly of its own existence, explicitly of that of the object. In this relation as realized in the primary judgment, that which knows is conceived as the ego or self,—that which is known, either as a mode of the ego or self, or as a mode of the non-ego or not-self. Thus we have, in the terms of the relation, a division of *existence* into the noumenon self and the contrasted phenomena of mind and of matter; while the *relation* itself yields a division of *knowledge* into philosophy, corresponding to its subjective, and science, corresponding to its objective, phase,—the latter being further subdivided into the sciences of mental and those of material phenomena.¹

2. Hamilton adopted the division of mental phenomena (not as states but as elements) into the three groups or classes of *cognition*, *feeling*, and *condition*. Cognitions he classified according to the different relations between subject and object, calling these relations,—as subjective, powers or faculties,—as objective, forms or stages, of knowledge. Under these, cognition is either immediate or mediate, *i.e.*, either consciousness itself or the datum of consciousness. The first of the faculties, therefore, is of immediate knowledge,—the acquisitive or presentative power, which yields perception (external and internal). The second is of that form of mediate knowledge which is representative of an individual object. Here Hamilton distinguished three moments or phases, which he termed the retentive, the reproductive, and the representative powers,—distinguished them perhaps too widely, but at the same time indicated their essential unity. The third is of that form of mediate knowledge in which a number of objects receive a factitious unity from being thought under a common relation. This he named the elaborative or discursive faculty.² Here, where he had to deal with consciousness in the form of experience, realized under actual conditions and comprehending every variety of mental life, Hamilton showed, in the first place, how the mutual action and reaction of the several elements produces the complexity which the phenomena present. Reminiscence, imagination, and judgment are all, as acts of which we are conscious, and which imply a prior immediate knowledge, contained in self-perception. But, on the other hand, our knowledge or perception even of self could not be what it is, did pre-

cesses of reminiscence, imagination, and judgment not enter into its composition. Consciousness includes all the particular forms of knowledge; yet its development into a whole is the effect of the agencies which make up its content.³ In the next place, he showed the laws of mental action in the conditions under which consciousness is exercised. From the variety and the limitation of consciousness, under the relation of time, arises the successive variation of its units,—in other words, the train of thought. By the limitation of consciousness is meant the limited number of objects to which it can at one time be directed, but this issues in a farther limitation, consisting in the disproportion between consciousness and the whole sum of mental modifications. Sir W. Hamilton held that consciousness is the mental modes or "movements, rising above a certain degree of intensity," and that "the movements beyond the conscious range are still properties—and effective properties—of the mental ego." This doctrine he used to explain not only the phenomena of ordinarily latent knowledge and of forgetfulness but also those of the abnormal recovery of apparently lost knowledge and of the formation of habits and dexterities.⁴ The units (or rather groups of units) of the train—partly former thoughts again present, partly thoughts for the first time present to the mind—follow one another according to what Hamilton called the law of integration, *i.e.*, "only as they stand together as relative parts of the same common whole." Of this supreme law subordinate phases determine more special consecutions of thought. The reappearance of former thoughts (reminiscence voluntary or involuntary) is governed by the laws of (1) reintegration and (2) repetition. "Thoughts tend to suggest one another which are coincidental (1) in time or (2) in mode." New wholes of thought are framed by successive analyses and syntheses. Under the law of integration these analyses are effected by means of attention and abstraction, *i.e.*, by consciousness being continuously and repeatedly concentrated on certain parts or aspects of objects and withdrawn from others. The syntheses of thought are infinitely diverse in character, yet possess in common an invariable form. This process of forming new wholes, by discrimination and comparison, out of the materials supplied by perception and recollection, is the one kind of mental activity recognized by Hamilton in the various products of thought, from the simplest to the most complex. In other words, he regards judgment as the fundamental act of mind, the proposition, or expressed judgment, as its primary product.⁵

3. Hamilton's theory of consciousness in its third aspect, *i.e.*, as a source of principles, is embodied in his doctrines of the *conditioned* and of *common sense*. The former is so called because it professes to be a demonstration that "the conditionally limited (what we may briefly call the conditioned) is the only possible object of knowledge and of positive thought." The name of the latter was adopted by Hamilton, not as in itself a good one, but as sanctioned by the usage of philosophers in general and of Scottish philosophers in particular. The doctrine itself is that the primary data of consciousness are, as such, *i.e.*, as facts, and solely on the authority of consciousness, to be accepted as true. The two doctrines are complements of each other, as several explanations of the principle of the relativity of human knowledge, which, common to both, is manifested in the one through that which we cannot know,—in the other through the inexplicable character of our fundamental cognitions.

The primary data of consciousness Hamilton held to be of two orders, otherwise diverse, but in this the same, that they are known merely as facts. These are—(1) truths of perception—the conviction of the reality as modes of self of our own thoughts and feelings, and the allied conviction that in sense-perception we come into contact with a reality external to the mind; and (2) truths of reason—the fundamental laws of logic, the necessary forms of thought or relations of existence (*i.e.*, quality, and quantity in its threefold aspect as time, space, degree), the causal judgment, the principle of substance and phenomenon, &c.⁶

Now here it was Hamilton's peculiar contribution to philosophy that he placed the data of perception along with the data of thought, and affirmed that both classes alike are inexplicable, yet as facts clear; that both rest on the same authority; and that, if the one be accepted as true, so also should be the other. He was a realist, because he held realism to be the dictate of consciousness. Evidently here the ground of the view is of even more importance than the view itself, and so to Hamilton the question of realism *versus* idealism was momentous chiefly from its connexion with that of the authority of consciousness. He was fully aware that, since he claimed so high an authority for the primary data of consciousness, it was necessary to supply the means of deciding whether any given cognition is or is not entitled to be placed among such; and to this end he laid down certain criteria of alleged primary facts of consciousness. These criteria are (1) simplicity, (2) universality and (subjective) necessity, (3) comparative evidence and certainty, (4)

incomprehensibility. In other words, no cognition is an original datum of consciousness which is not simple (*i.e.*, incapable of being resolved into another), not held by all men as a self-evident and necessary truth, and not in itself inexplicable. Now the doctrine of the immediate knowledge of the non-ego will, Hamilton affirmed, stand all these tests. It is the simple residuum of truth in the crude and erroneous beliefs of men as to what they perceive through their senses; it is the spontaneous conviction of all (as to this he cited as witnesses philosophers who regarded the belief as a mistake and a delusion); and it does not admit of being made comprehensible.¹ That this is so can hardly be denied. Practically, indeed, all knowledge that consciousness does intuitively affirm what he alleges it to affirm—and, the question being one of fact, a practical acknowledgment is quite as good as a theoretical one.

Here let it be remarked in passing that Hamilton's doctrine of common sense is wholly misrepresented when held up as an appeal to the belief of the unthinking multitude *versus* the judgment of philosophers. Rather it carries the appeal into a sphere where the philosophic and the vulgar have ceased to be distinguished; it shows that not the mind of the philosopher, and not the mind of the vulgar, but the mind of man, is what philosophy has to deal with, and that its office is to resolve current beliefs into their elements, not satisfied till it has reached the final and absolutely pure deliverance of consciousness.

But it may be said, as it often has been said, that consciousness is not competent to affirm immediate knowledge of the non-ego, because to discriminate the non-ego from the ego is beyond its power. Hamilton's answer is that, if knowledge be, as he holds, essentially relative, self cannot be known except with and through not-self, and that natural realism is but a corollary of the general principle of the relativity of knowledge. On that principle he held that "we think one thing only as we think two things mutually and together," and that, self being inherently a relative notion, we should never interpret by it facts of our experience, if experience did not come before us under a relation that needs both terms (self and not-self) for its expression. Hamilton certainly implies, if he does not expressly say, that, had we no knowledge of a not-self, we could never objectify self so as to know it as such at all. To him a knowledge of the ego alone would be absolute, not relative—such a knowledge, that is, as he held to be impossible. But, viewing knowledge as a relation between an existing subject and an existing object, he saw no reason why the object should not be what it is known as—sometimes a mode of self, sometimes a mode of not-self,—and why consciousness of the ego should not include also that which stands in relation with it.²

But that there has been so amazing an amount of misconception on the point, it might seem hardly needful to say that Hamilton did not hold that in perception we know the thing-in-itself. His doctrine of relativity included phenomenalism, though it was more than phenomenalism; and not only his oft-repeated assertions that there can be no such object of knowledge, but the whole tenor of his philosophy, are directly against this interpretation. In passages where he speaks of "the thing" as directly known, the word is obviously used, not for noumenon or the thing in itself, but for the real as opposed to the ideal in phenomena. There can be no doubt that he held the object in sense-perception to be a phenomenon of the non-ego; and arguments that proceed upon a different supposition are of no effect against his theory.

The relativity of perception on that theory is, indeed, not open to doubt. According to him, we perceive phenomena alone,—such alone as we have faculties to apprehend,—such alone as stand in relation to our organs of sense; and we perceive only under the contrast of self and not-self. There is thus in every act of perception a twofold relation—(1) between the thing and the organ, manifested in sensation being a condition of perception, and (2) between self and not-self, manifested in consciousness and perception being different names for the same thing. This of itself should show that he cannot be expected to state definitely what is the object in perception,—as it has often been said that he does not do, or does differently in different places. The object of intuition or perception does not admit of being definitely stated. For individual objects cannot as such be conceived, still less named, till knowledge has risen above the intuitive or perceptive stage. On this, as on all points relating to perception, Hamilton's mature and carefully expressed view is to be found in his dissertations appended to Reid's works. There he divides the qualities of body into three classes,—primary, secondary, and secundo-primary. He shows that sensation and perception proper, though up to a certain point inseparable, are not only distinct, but above that point actually in the inverse ratio of one another; that sensations proper (identical with the secondary qualities) are merely subjective affections of the animated organism, and afford no knowledge of external reality; that in perception proper the material organism, which is to be regarded as an external reality, is presented under those relations which constitute its extension, *i.e.*, we know its primary qualities; and that in sensation

and perception together we know the secundo-primary qualities, *i.e.*, objects external to the body become known, as directly related, through various modes of resistance, to the organism in motion. The object in perception is, then, according to him, a primary quality of the organism, or the quasi-primary phase of a secundo-primary quality. It is a fundamental point of Hamilton's doctrine that the organism is differently related to the ego in perception proper and in sensation proper. In his own words—"the organism is the field of apprehension to both, but with this difference, that the former views it as of the ego, the latter as of the non-ego,—that the one draws it within, the other shuts it out from, the sphere of self." On this distinction is partly founded his doctrine of the twofold character of space, as at once an *a priori* conception and an *a posteriori* perception. He held with Kant that space is a necessary condition of thought, and as such not derived from experience; but he at the same time held that through sense we have a perception of something extended, *i.e.*, of extension. Now the cognition of extension is a cognition of relations,—properly therefore realized by a simple energy of thought; but the facts that sensation is an essential condition of this cognition, and that what is known as extended is the organism, which is as much external to the ego as any other part of the material world, seemed to him to justify these relations being regarded not as subjective but as objective.³

Hamilton's doctrine of the conditioned relates to the second group of primary truths or original data of consciousness. Relativity, as a general condition of the thinkable, he asserts, is brought to bear under three principal and necessary relations:—the first (subjective) the contrast of self and not-self, the second (objective) quality, and the third (objective) quantity. Quality is realized under the twofold aspect of substance and phenomenon. Quantity has three phases:—time (protensive), space (extensive), degree (intensive). Now the doctrine of the conditioned is (1) that under these relations—especially those of quality and time—we must think everything; (2) that the unconditioned as such is either the unconditionally limited—the absolute, or the unconditionally unlimited—the infinite; and (3) that, under the necessary relations of thought, we are unable positively to conceive either unconditional limitation or unconditional illimitation; *e.g.*, an absolute whole or part of existence in time or in space or in degree is inconceivable, so is infinite increase or division; absolute quality is inconceivable, quality infinitely undetermined is so equally.⁴ Thus this doctrine claims to demonstrate the limited range of positive thought, by showing that the mind is tossed from the one to the other of two contradictory extremes, unable to conceive either, yet compelled to believe that one or other is actual. The kind of inconceivability of the two extremes is indeed different, and it may be regretted that, in his expositions of this part of his philosophy, Hamilton did not more explicitly recognize that fact. It seems true that to combine the absolute with existence regarded quantitatively, *i.e.*, in time or in space or in degree, or the infinite with existence regarded qualitatively, is impossible, not only as beyond but as against thought, *i.e.*, as involving a contradiction; and therefore that, in respect of one of the two extremes, the mind is not simply impotent, seeing it rejects it as that to which there can be nothing answering in actual existence. But then it does so only to find itself face to face with an alternative which, while it must be inferred to be actual, can by no effort be realized in thought. So that, even if this objection be allowed, the doctrine still remains intact as a demonstration how limited is the sphere of human thought as compared with that of existence, and how little human powers of conception are to be made the measure of truth.

Its significance becomes still more apparent in the original and ingenious application made of it by Hamilton to the solution of such philosophic problems as the origin of the principles of cause and effect, substance and phenomenon, &c. That the sum of existence of one set of modes has passed into another mode is, according to him, what we mean by saying that an event had causes. Consciousness is a knowledge of existence only as conditioned in time, and we are impotent—(it matters not *how*)—to conceive the forms of existence within our experience as having had an absolute commencement; therefore we conceive them as having existed in other forms, in other words, as caused. Thus it is in order to escape from the necessity of thinking an absolute beginning for existence in time that we view all things as a series of causes and effects. In like manner, it is because we can think neither that which exists in and for itself nor that which exists merely in and through something else that we recognize all objects under the double aspect of substance and phenomenon,—knowing nothing but the latter, yet always supposing the former.⁵

Having showed that the original data of consciousness, however different in other respects, are alike in this, that they are as

³ Reid's Works, 104n, 247n, 809, 816-888; Lects., I. 136-155, II. 129-132, §22, Disc., 54, 639.

⁴ Reid's Works, 743, 934; Lects., II. 366-374, 623-638; III. 98-105; Disc., 12-13, 28-30, 536-604.

⁵ Reid's Works, 935-937; Lects., II. 376-413, 538-541; Disc., 604-617.

² Lects., II. 537; Disc., 61, 599.

facts—but only as facts—clear and certain, and as cognitions relative, more properly indeed, beliefs than cognitions,—Hamilton claims for all that, on the sole authority of consciousness, they be accepted as truths. This is the point to which the whole of his philosophy leads up; hence he offers no arguments in its support. He only asks—If the authority of consciousness be disallowed, what other warrant of truth remains? Where else will a source of certainty be found? He saw no alternative between absolute scepticism and implicit reliance on consciousness. But his reliance was no absolute and blind belief. He claimed implicit credence for consciousness only after having investigated and laid down the conditions of its credibility. The inexplicability that is to him a mark of truth must be proved to be that which springs from the fundamental character of the cognition. While the establishment of principles on which belief may be sure, rational, and consistent is the ultimate aim of his philosophy, groundless or inconsistent belief he sweeps away wherever he meets with it. Thus he will not allow the validity of belief in an external reality which, *ex hypothesi*, is not known.¹ Be it noted too, that it is consciousness, *i. e.*, reason, for which he claims supreme authority.² His position is best understood through the mutual relation (already referred to) of his doctrines of the conditioned and of common sense. The former extends the bounds of existence as much as it narrows those of thought, and so makes room for belief; while the latter shows belief to be the condition on which alone even primary and fundamental truths can be apprehended. Thus, for example, on the ground of both, he held that freedom of will and necessity are alike inconceivable, but that we are not entitled to reject the testimony of consciousness to the fact that as moral agents we are free, on account of the speculative difficulties with which it is surrounded.³ These two doctrines Sir W. Hamilton did not himself apply to theology, and in themselves they have no direct theological bearing, since the one is concerned with the infinite and the absolute merely as notions, and the other with simple forms of thought long prior to those of theology. But his references to this subject indicate clearly what he considered to be the true relation of theology to philosophy, and show that, in the one as in the other, he held wisdom to lie in such a conviction of human ignorance as disposes the mind to accept harmony with the facts of consciousness as evidence of truth.⁴

Of the three classes into which, as we have seen, Hamilton divided mental phenomena, the third—the phenomena of conation—is not treated of in his *Lectures*, and his other works contain only fragmentary discussions of particular ethical points. Several lectures, however, are devoted to the consideration of the phenomena of feeling and the development of a theory of pleasure, founded chiefly on that of Aristotle, which is in substance that pleasure is the reflex in consciousness of the spontaneous and unimpeded exercise of power or energy,—pain being, on the other hand, the consciousness of overstrained or repressed exertion.⁵

The logic with which Sir W. Hamilton's name is associated is a purely formal science. Nothing else indeed did he consider properly to be called logic. For it seemed to him an unscientific mixing together of heterogeneous elements to treat as parts of the same science the formal and the material conditions of knowledge. He was quite ready to allow that on this view logic cannot be used as a means of discovering or guaranteeing facts, even the most general, and expressly asserted that it has to do, not with the objective validity, but only with the mutual relations, of judgments. He further held that induction and deduction are correlative processes of formal logic, each resting on the necessities of thought, and deriving thence its several laws. In establishing the distinction between logical and scientific induction, he showed that deduction no more than induction is self-sufficient, since it also must have a prior process to start from before it can be applied to nature. He also held that no other than formal logic can be distinguished from the body of the sciences. Perhaps he may have too much overlooked the fact that the search for causes (a problem common to all the sciences) and the presumable uniformity of nature (a principle capable of guaranteeing general inferences) yield the conditions of a logic entitled to the name of a science of science, and possessing all the importance of the knowledge whose organon it is. Yet it is well to be reminded by a difference of name that a science such as this, consisting of inferences from the actual order of things, is quite distinct from the body of truths developed from the conditions of thought as such.

The only logical laws recognized by Hamilton were the three axioms of identity, non-contradiction, and excluded middle, which he regarded as severally phases of one general condition of the possibility of existence and, therefore, of thought. The law of reason and consequent he considered not as different, but merely as expressing metaphysically what these express logically. He added as a postulate—which in his theory was of importance—"that logic be allowed to state explicitly what is thought implicitly."

The changes by which he to a great extent remodelled formal

logic were the result (1) of applying to propositions and syllogisms the two aspects of notions as wholes,—*extension*, answering to the objects denoted, and *intension*, answering to the attributes connoted,—and (2) of assigning quantity to the predicate as well as to the subject in judgments of extension. These judgments receive the form of an equation. Only simple conversion is allowed, but, all propositions being shown to be capable of simple conversion, the class of immediate inferences is greatly increased. Categorical syllogisms (inductive and deductive) may be either unfigured or figured, according as the distinction of subject and predicate and the distinctions included in that are or are not recognized. Unfigured syllogism has but one form; figured syllogisms are of three forms, according to the position of the middle term in the premises. Of these the first corresponds to the first and fourth figures of ordinary logic,—the moods of the latter being shown to be merely indirect intensive moods of the first. The laws of categorical syllogism are reduced to one. On the other hand, one of the results of the quantification of the predicate being to increase the number of propositional forms, a number of new moods are added, and each figure contains twelve. Hypothetical and disjunctive inferences, whether regarded as mediate or as immediate,—(as to this Hamilton varied in opinion, *cf.*, *Lects.*, iv. 369, 371, 373, 374),—form a separate class of syllogisms,—the conditional, properly subdivided into conjunctive and disjunctive; for, according to Hamilton, as all inference is hypothetical, this term ought not to be used as the name of one particular group. The quantities allowed by him in logic were but two—the definite, including the universal and singular, and the indefinite. The latter also he considered to be twofold,—partiality as such, from which the universal, both affirmative and negative, is excluded, and partiality which excludes only one universal extreme, while possibly admitting the other. All these improvements were embodied in a notation that clearly and compendiously presents to the eye the whole logical scheme.⁶

Even from this imperfect outline of Hamilton's system of psychology, metaphysics, and logic it appears how extensive and original were his labours in the various departments of philosophy, how powerful an impetus he gave to speculation, and how much he himself contributed to the elucidation of the ultimate problems of thought. By his thorough-going analysis of consciousness and of the relation of consciousness to mind he did much to promote the scientific study of psychology in his own country and in America,—in particular to give it at once a sound method and a well-defined sphere. He did not himself trace the growth of consciousness; but, by showing that it is both simple and complex, both involving and evolved, he implied that it had grown, and suggested the problem of the conditions of its development. On the other hand, to him there was a wide gulf between mental and material phenomena, and the acceptance of innate ideas was attended with no difficulty; thus his point of view is so far removed from that of most of the psychologists of the present day that probably his influence now is much less either than it was in his own lifetime or than it may be hereafter.

In metaphysics his place is plainly marked. Taking his stand at once on the exclusive authority and on the limited sphere of human consciousness, he comes into direct antagonism with all schools of philosophy that find in the *Unconditioned* a field for speculation. At the same time he is divided from scepticism by his assertion that, as the realm of existence transcends that of thought, so belief is wider than knowledge, and from empiricism by his admission of *a priori* and inexplicable cognitions. He ranked himself among the Scottish school of philosophers; yet there he stands by himself, since even those doctrines which he held in common with his predecessors he held after a fashion widely different as to both grounds and results. The doctrine of common sense, in particular, he set in a new light, rescued from misapprehension, and showed, on the testimony of every school of thought, to be one of the most widely recognized of philosophic tenets. In Reid he found a philosopher to whom by many ties of intellectual affinity he was bound, and who seemed to him to have so unskillfully used the right clue to a solution of the problems

with which he dealt as to justify the doubt whether he really had it. Hence he made Reid's writings, as it were, his own, corrected his errors, and gave a solid basis to the theory which he had himself failed even to make plain.

The philosopher to whom above all others he professed allegiance was Aristotle. His works were the object of his profound and constant study, and supplied in fact the mould in which his whole philosophy was cast. With the commentators on the Aristotelian writings, ancient, mediæval, and modern, he was also familiar; and the scholastic-philosophy he studied with care and appreciation at a time when it had hardly yet begun to attract attention in his country. His wide reading enabled him to trace many a doctrine to the writings of forgotten thinkers; and nothing gave him greater pleasure than to draw forth such from their obscurity, and to give due acknowledgment, even if it chanced to be of the prior possession of a view or argument that he had thought out for himself. Of modern German philosophy he was a diligent, if not always a sympathetic, student. How profoundly his thinking was modified by that of Kant is evident from the tenor of his speculations; nor was this less the case because, on fundamental points, he came to widely different conclusions. There is a closer likeness as to results between his system and that of Jacobi,—from which, however, his is distinguished by its more scientific character, especially by intuition being more clearly identified with the voice of reason, and more rigidly required to prove its authority as such.

His labours in logic coincided in time with a general movement by which formal logic was effectually advanced and improved. But as to the originality of his contributions, especially in regard to the quantification of the predicate, there is no room for doubt. No evidence has ever been adduced that in the smallest degree weakens the force of the abundant evidence brought forward in its support.

Any account of Hamilton would be incomplete which regarded him only as a philosopher, for his knowledge and his interests embraced all subjects related to that of the human mind. Physical and mathematical science had, indeed, no attraction for him; but his study of anatomy and physiology was minute and experimental. In literature alike ancient and modern he was widely and deeply read; and, from his unusual powers of memory, the stores which he had acquired were always at command, every topic suggesting to him apt quotations or pertinent examples. If there was one period with the literature of which he was more particularly familiar, it was the 16th and 17th centuries. Here in every department he was at home. He had gathered a vast amount of its theological lore, had a critical knowledge especially of its Latin poetry, and was minutely acquainted with the history of the actors in its varied scenes, not only as narrated in professed records, but as revealed in the letters, table-talk, and casual effusions of themselves or their contemporaries. His article on the *Epistolæ Obscurorum Virorum*, and his pamphlet on the Disruption of the Church of Scotland in 1843, may be cited in confirmation and illustration of what has now been said. Among his literary projects were editions of the works of George Buchanan and Julius Cæsar Scaliger. His general scholarship found expression in his library, which, though mainly, was far from being exclusively, a philosophical collection. It now forms a distinct portion of the library of the university of Glasgow.

His chief practical interest was in education,—an interest which he manifested alike as a teacher and as a writer, and which had led him long before he was either to a study of the subject both theoretical and historical. He thence adopted views as to the ends and methods of education that, when afterwards carried out or advocated by him, met with general recognition; but he also expressed in

one of his articles an unfavourable view of the study of mathematics as a mental gymnastic which excited much opposition, but which he never saw reason to alter. As himself a teacher, he was zealous and successful. He did not indeed deem it necessary to give to his lectures the elaboration and precision that he bestowed on his published writings. But he made them sufficient for the end which they had to accomplish, he supplemented them at times by other instruction; and he strove, not only by all academic means, but also by his personal influence, to develop the speculative energy and interest of his pupils. His writings on university organization and reform had, at the time of their appearance, a decisive practical effect, and contain much that is of permanent value.

Many of his moral as well as intellectual characteristics are expressed in his writings,—the intensity and force of his nature, his tendency to be carried away by polemical ardour, his freedom from anything like pettiness, his perfect sincerity and candour. Such a reflex is at best very imperfect, but here could hardly be bettered by description, which, therefore, is not attempted.

His posthumous works are his *Lectures on Metaphysics and Logic*, 4 vols., edited by the Rev. H. L. Mansel, Oxford, and Professor Veitch (*Metaphysics*, 1858; *Logic*, 1860); and *Additional Notes to Reid's Works, from Sir W. Hamilton's MSS.*, under the editorship of the Rev. H. L. Mansel, D.D., 1862. A *Memoir of Sir W. Hamilton*, by Professor Veitch, appeared in 1869. (E. H.)

HAMILTON, SIR WILLIAM (1730–1803), antiquary and patron of the fine arts, was born in 1730 of a noble but needy Scottish family. Of his early life and education we know nothing beyond the fact that he was equerry to Prince George, afterwards George III., whose foster-brother he is said to have been; but in his twenty-fifth year he married a young and beautiful heiress, whose fortune placed him in affluence. In the first parliament of George III. Hamilton sat as member for Midhurst; and in 1764 he was accredited ambassador to Naples, an office which he retained till 1800. On proceeding to his post his attention and interest were at once awakened by the discoveries at Pompeii and Herculaneum, and he took up the study of antiquities with ardour. The Porcinari collection of Greek and Etruscan vases, purchased in 1765, was the nucleus of a valuable collection of his own, now for the most part in the British Museum. Engravings and descriptions of the most valuable pieces are given in the famous *Antiquités Etrusques, Grecques, et Romaines, tirées du Cabinet de M. Hamilton*, edited by D'Hancarville, and published at Naples in 1766–67. Hamilton also contributed liberally to the museum at Portici, and gave much attention to the MSS. and other valuable articles rescued from the buried cities; but his efforts were almost nullified by the inertness of the Neapolitan court, which was even suspicious of his zeal. Natural history and science also were not neglected by him. Between 1764 and 1767 Hamilton paid numerous visits to Vesuvius, Etna, and the Lipari Islands, accompanied by a young artist, Pietro Fabris, who made drawings of the noteworthy objects and appearances under Hamilton's directions. The result of these excursions, first sent as letters to the Royal Society, of which he became a member in 1766, was afterwards expanded into two works,—*Observations upon Mount Vesuvius, Mount Etna, and other Volcanoes of the Two Sicilies*, published at London in 1772, and *Campi Phlegreæi*, a collection of plates illustrating the volcanic phenomena, accompanied by concise descriptions in English and French, published at Naples in 1776–77. A *Supplement* to the latter described the eruption of Mount Vesuvius in 1779. Hamilton's daughter died in 1775, and his first wife in 1782. In 1772 he was made K.C.B., and in 1791 privy councillor. His continued interest in art and antiquity is manifested by his contributions to the *Philosophical Transactions of the Royal Society* from 1767

to 1795, and to the *Archæologia* in 1777, as well as by his generosity to artists and antiquaries, such as Morghen, Winckelmann, and Piaggi. Recalled in 1800, he died April 6, 1803.

Sir William Hamilton's second wife, Emma Lyon or Harte, whose name is so notoriously associated with that of Nelson, was born of very humble parents at Preston in Lancashire, about April 26, 1764. Her youth was spent in domestic service, and it was first as attendant on a lady of fashion that she learned to develop her talent for singing and mimicry. Having lost this situation she became waitress in a tavern frequented by actors, and soon entered upon a gay and dissolute career. Her beauty attracted among others the painter Romney, who depicted her in no fewer than twenty-three of his works. Sir William Hamilton married her in 1791; and, going with him the same year to Naples, she speedily acquired an ascendancy over the mind of the queen, which at the instigation of Nelson she used for the advantage of the British fleet. On the death of Sir William she lived in a house at Merton Place, provided for her by Nelson, but on his death in 1805 she soon squandered the modest fortune left her by her husband, and after being imprisoned for debt, retired with Nelson's daughter Horatia to Calais, where she died, January 16, 1815. Her *Memoirs* appeared in the year of her death.

HAMILTON, WILLIAM (1704-1754), a minor Scottish poet, the author of *The Braes of Yarrow*, was born in 1704, probably at Bangour in Linlithgowshire, the second son of James Hamilton of Bangour, a member of the Scottish bar. It is supposed that he studied at the university of Edinburgh; and it is certain that he received an education which enabled him to enjoy the classical writers of Greece and Rome, and to be a congenial associate in after years with such men as Allan Ramsay and Henry Home. As early as 1724 we find him contributing to Ramsay's *Tea Table Miscellany*. In 1745 Hamilton joined the cause of Prince Charles, and, though it is doubtful whether he actually bore arms, he certainly celebrated the battle of Prestonpans in an ode beginning—"As over Gladmuir's blood-stained field." After the disaster of Culloden he lurked for several months in the Highlands, and at length escaped to France; but in 1749 the influence of his friends at home procured him permission to return to Scotland, and in the following year he obtained possession of the family estate of Bangour. In 1751 he married for the second time, but the state of his health was such that he soon afterwards went abroad, and he died at Lyons on 25th March 1754.

Hamilton has left behind him a considerable number of what are best described as poetical effusions, many of them pleasing and tasteful, but none of them except the *Braes of Yarrow* of striking originality. The first collection of his pieces was published without his permission or even knowledge by Foulis (Glasgow, 1748), and introduced by a preface from the pen of Adam Smith. Another edition with corrections by himself was brought out by his friends in 1760, and to this was prefixed a portrait engraved by Sir Robert Strange. Though the poems have been since reprinted in Anderson's *British Poets* (vol. ix.), in Sharpe's *Collection of the British Poets*, and in Chalmers's *English Poets* (vol. xv.), there was no separate edition between 1760 and 1850, when James Paterson edited *The Poems and Songs of William Hamilton*. This volume contains several poems till then unpublished, and presents a bibliographical introduction and life of the author.

See also James Chalmers's "Notices of Life of William Hamilton" in *Transactions of Society of Scottish Antiquaries*, vol. iii., 1831; and Charles Mackay, *The Poetical Works of Allan Ramsay, with Selections from the Scottish Poets before Burns*.

HAMILTON, SIR WILLIAM ROWAN (1805-1865), one of the really great mathematicians of the present century, was born in Dublin, August 4, 1805. His father, who was a solicitor, and his uncle (curate of Trim), migrated from Scotland in youth. A branch of the Scottish family to which they belonged had settled in the north of Ireland in

the time of James I., and this fact seems to have given rise to the common impression that Hamilton was an Irishman.

His genius displayed itself, even in his infancy, at first in the form of a wonderful power of acquiring languages. At the age of seven he had already made very considerable progress in Hebrew, and before he was thirteen he had acquired, under the care of his uncle, who was an extraordinary linguist, almost as many languages as he had years of age. Among these, besides the classical and the modern European languages, were included Persian, Arabic, Hindustani, Sanskrit, and even Malay. But though to the very end of his life he retained much of the singular learning of his childhood and youth, often reading Persian and Arabic in the intervals of sterner pursuits, he had long abandoned them as a study, and employed them merely as a relaxation.

His mathematical studies seem to have been undertaken and carried to their full development without any assistance whatever, and the result is that his writings belong to no particular "school," unless indeed we consider them to form, as they are well entitled to do, a school by themselves. As an arithmetical calculator he was not only wonderfully expert, but he seems to have occasionally found a positive delight in working out to an enormous number of places of decimals the result of some irksome calculation. At the age of twelve he engaged Colburn, the American "calculating boy," who was then being exhibited as a curiosity in Dublin, and he had not always the worst of the encounter. But, two years before, he had accidentally fallen in with a Latin copy of *Euclid*, which he eagerly devoured; and at twelve he attacked Newton's *Arithmetica Universalis*. This was his introduction to modern analysis. He soon commenced to read the *Principia*, and at sixteen he had mastered a great part of that work, besides some more modern works on analytical geometry and the differential calculus.

About this period he was also engaged in preparation for entrance at Trinity College, Dublin, and had therefore to devote a portion of his time to classics. In the summer of 1822, in his seventeenth year, he began a systematic study of Laplace's *Mécanique Céleste*. Nothing could be better fitted to call forth such mathematical powers as those of Hamilton; for Laplace's great work, rich to profusion in analytical processes alike novel and powerful, demands from the most gifted student careful and often laborious study. It was in the successful effort to open this treasure-house that Hamilton's mind received its final temper. "Des-lors il commença à marcher seul," to use the words of the biographer of another great mathematician. From that time he appears to have devoted himself almost wholly to original investigation (so far at least as regards mathematics), though he ever kept himself well acquainted with the progress of science both in Britain and abroad.

Having detected an important defect in one of Laplace's demonstrations, he was induced by a friend to write out his remarks, that they might be shown to Dr Brinkley, afterwards bishop of Cloyne, but who was then royal astronomer for Ireland, and an accomplished mathematician. Brinkley seems at once to have perceived the vast talents of young Hamilton, and to have encouraged him in the kindest manner. He is said to have remarked in 1823 of this lad of eighteen,—“This young man, I do not say *will be*, but *is*, the first mathematician of his age.”

Hamilton's career at college was perhaps unexampled. Amongst a number of competitors of more than ordinary merit, he was first in every subject, and at every examination. His is said to be the only recent case in which a student obtained the honour of an *optime* in more than one subject. This distinction had then become very rare, not being given unless the candidate displayed a thorough mastery over his subject. Hamilton received it for Greek

and for physics. How many more such honours he might have attained it is impossible to say; but he was expected to win both the gold medals at the degree examination, had his career as a student not been cut short by an unprecedented event. This was his appointment to the Andrews professorship of astronomy in the university of Dublin, vacated by Dr Brinkley in 1827. The chair was not exactly offered to him, as has been sometimes asserted, but the electors, having met and talked over the subject, authorized one of their number, who was Hamilton's personal friend, to urge him to become a candidate, a step which his modesty had prevented him from taking. Thus, when barely twenty-two, he was established at the Dublin Observatory. He was not specially fitted for the post, for although he had a profound acquaintance with theoretical astronomy, he had paid but little attention to the regular work of the practical astronomer. And it must be said that his time was better employed in grand original investigations than it would have been had he spent it in meridian observations made even with the best of instruments,—infinitely better than if he had spent it on those of the observatory, which, however good originally, were then totally unfit for the delicate requirements of modern astronomy. Indeed there can be little doubt that Hamilton was intended by the university authorities who elected him to the professorship of astronomy to spend his time as he best could for the advancement of science, without being tied down to any particular branch. Had he devoted himself to practical astronomy they would assuredly have furnished him with modern instruments and an adequate staff of assistants.

In 1835, being secretary to the meeting of the British Association which was held that year in Dublin, he was knighted by the lord-lieutenant. But far higher honours rapidly succeeded, among which we may merely mention his election in 1837 to the president's chair in the Royal Irish Academy, and the rare and coveted distinction of being made corresponding member of the academy of St Petersburg. These are the few salient points (other, of course, than the epochs of his more important discoveries and inventions presently to be considered) in the uneventful life of this great man. He retained his wonderful faculties unimpaired to the very last, and steadily continued till within a day or two of his death (September 2, 1865) the task (his *Elements of Quaternions*) which had occupied the last six years of his life.

The germ of his first great discovery was contained in one of those early papers which in 1823 he communicated to Dr Brinkley, by whom, under the title of *Causitics*, it was presented in 1824 to the Royal Irish Academy. It was referred as usual to a committee. Their report, while acknowledging the novelty and value of its contents, and the great mathematical skill of its author, recommended that, before being published, it should be still further developed and amplified. During the next three years the paper grew to an immense bulk, principally by the additional details which had been inserted at the desire of the committee. But it also assumed a much more intelligible form, and the grand features of the new method were now easily to be seen. Hamilton himself seems not till this period to have fully understood either the nature or the importance of his discovery, for it is only now that we find him announcing his intention of applying his method to dynamics. The paper was finally entitled "Theory of Systems of Rays," and the first part was printed in 1828 in the *Transactions of the Royal Irish Academy*. The second and third parts have not yet been printed; but it is understood that their more important contents have appeared in the three voluminous supplements (to the first part) which have been published in the same *Transactions*, and in the two papers "On a General Method in Dynamics," which appeared in the *Philosophical Transactions* in 1834-5. The principle of "Varying Action" is the great feature of these papers; and it is strange, indeed, that the one particular result of this theory which, perhaps more than anything else that Hamilton has done, has rendered his name known beyond the little world of true philosophers, should have been easily within the reach of Fresnel and others for many years before, and in no way required Hamilton's new conceptions or methods, although it was by them that he was

led to its discovery. This singular result is still known by the name "Conical Refraction," which he proposed for it when he first predicted its existence in the third supplement to his *Systems of Rays*, read in 1832.

The step from optics to dynamics in the application of the method of "Varying Action" was made in 1827, and communicated to the Royal Society, in whose *Philosophical Transactions* for 1834 and 1835 there are two papers on the subject. These display, like the "Systems of Rays," a mastery over symbols and a flow of mathematical language almost unequalled. But they contain what is far more valuable still, the greatest addition which dynamical science had received since the grand strides made by Newton and Lagrange. Jacobi and other mathematicians have developed to a great extent, and as a question of pure mathematics only, Hamilton's processes, and have thus made extensive additions to our knowledge of differential equations. But there can be little doubt that we have as yet obtained only a mere glimpse of the vast physical results of which they contain the germ. And though this is of course by far the more valuable aspect in which any such contribution to science can be looked at, the other must not be despised. It is characteristic of most of Hamilton's, as of nearly all great discoveries, that even their indirect consequences are of high value.

The other great contribution made by Hamilton to mathematical science, the invention of QUATERNIONS, is fully treated under that heading. It is not necessary to say here more than this, that quaternionic form as great an advance relatively to the Cartesian methods as the latter, when first propounded, formed relatively to Euclidian geometry. The following characteristic extract from a letter shows Hamilton's own opinion of his mathematical work, and also gives a hint of the devices which he employed to render written language as expressive as actual speech. His first great work, *Lectures on Quaternions* (Dublin, 1852), is almost painful to read in consequence of the frequent use of italics and capitals.

"I hope that it may not be considered as unpardonable vanity or presumption on my part, if, as my own taste has always led me to feel a greater interest in *methods* than in *results*, so it is by *METHODS*, rather than by *any THEOREMS*, which can be separately *quoted*, that I desire and hope to be remembered. Nevertheless it is only human nature, to derive *some* pleasure from being cited, now and then, even about a 'Theorem;' especially where the *quoter* can enrich the subject, by combining it with researches of *his own*."

The discoveries, papers, and treatises we have mentioned might well have formed the whole work of a long and laborious life. But, not to speak of his enormous collection of MS. books, full to overflowing with new and original matter, which have been handed over to Trinity College, Dublin, and of whose contents it is to be hoped a large portion may yet be published, the works we have already called attention to barely form the greater portion of what he has published. His extraordinary investigations connected with the solution of algebraic equations of the fifth degree, and his examination of the results arrived at by Abel, Jerrard, and Badano, in their researches on this subject, form another grand contribution to science. There is next his great paper on *Fluctuating Functions*, a subject which, since the time of Fourier, has been of immense and ever increasing value in physical applications of mathematics. There is also the extremely ingenious invention of the HODOGRAPH (*q. v.*). Of his extensive investigations into the solution (especially by numerical approximation) of certain classes of differential equations which constantly occur in the treatment of physical questions, only a few items have been published, at intervals, in the *Philosophical Magazine*. Besides all this, Hamilton was a voluminous correspondent. Often a single letter of his occupied from fifty to a hundred or more closely written pages, all devoted to the minute consideration of every feature of some particular problem: for it was one of the peculiar characteristics of his mind never to be satisfied with a general understanding of a question; he pursued it until he knew it in all its details. He was ever courteous and kind in answering applications for assistance in the study of his works, even when his compliance must have cost him much valuable time. He was excessively precise and hard to please with reference to the final polish of his own works for publication; and it was probably for this reason that he published so little compared with the extent of his investigations.

Like most men of great originality, Hamilton generally matured his ideas before putting pen to paper. "He used to carry on," says his elder son, "long trains of algebraical and arithmetical calculations in his mind, during which he was unconscious of the earthly necessity of eating; we used to bring in a 'snack' and leave it in his study, but a brief nod of recognition of the intrusion of the chop or cutlet was often the only result, and his thoughts went on soaring upwards."

For further details about Hamilton (his poetry and his association with poets, for instance), the reader is referred to the *Dublin University Magazine* (Jan. 1842), the *Gentleman's Magazine* (Jan. 1866), and the *Monthly Notices of the Royal Astronomical Society* (Feb. 1866); and also to an article by the present writer in the *North British Review* (Sept. 1866), from which much of the above sketch has been taken. (P. G. T.).

HAMÍRPUR, or **HUMEERPOOR**, a British district in the lieutenant-governorship of the North-Western Provinces, India, lying between 25° 5' and 26° 10' N. lat., and between 79° 22' 45" and 80° 25' 15" E. long. It forms the south-western district of the Allahábád division, and is bounded on the N. by the Jumna (Jamuná); on the N.W. by the native state of Baoni and Betwa river; on the W. by the Dhasán river; on the S. by Alípara, Chhatarpur, and Charkhári states; and on the E. by the Banda district. It encloses the native states of Sarila, Jigní, and Bihat, besides portions of Charkhári and Garrauli.

Hamírpur forms part of the great plain of Bundelkhand, which stretches between the banks of the Jumna and the central Viudhyán plateau. The district is in shape an irregular parallelogram, with a general slope northward from the low hills on the southern boundary. The scenery is rendered picturesque by the artificial lakes of Mahoba. These magnificent reservoirs were constructed by the Chandel rájás about 800 years ago, for purposes of irrigation and as sheets of ornamental water. Many of them enclose craggy islets or peninsulas, crowned by the ruins of granite temples, exquisitely carved and decorated. From the base of this hill and lake country the general plain of the district spreads northward in an arid and treeless level towards the broken banks of the rivers. Of these the principal are the Betwa and its tributary the Dhasán, both of which are unnavigable. There is little waste land, except in the ravines by the river sides. The deep black soil of Bundelkhand, known as *már*, retains the moisture under a dried and rifted surface, and renders the district fertile.

The census of 1872 gives a population of 529,137—276,196 males and 252,941 females. The Hindus numbered 493,877, and the Mahometans 33,658. The Chandols and Bundelas, the old dominant classes, have now sunk to 548 and 612 respectively; most of these still cling to the neighbourhood of Mahoba, the seat of their former supremacy. The district contains 6 towns with a population of more than 5000 souls—namely, Ráth, Hamírpur, Mahoba, Maudha, Sumerpur, and Jáitpur. The staple produce of the district is grain of various sorts, the most important being gram. Cotton is also a valuable crop, whose cultivation is on the increase. Out of a total area of 1,464,641 acres, 762,212 are under cultivation. Irrigation is practised on only 16,000 acres, chiefly in the south, where water can be obtained from the artificial lakes. Agriculturists suffer much from the spread of the *kíns* grass, a noxious weed which overruns the fields and is found to be almost ineradicable, wherever it has once obtained a footing. The district is little subject to blight or flood; but droughts and famine are unhappily common. The scarcity of 1837 and 1868-69 was severely felt in Hamírpur. Commerce is chiefly carried on by means of its great river highway, the Jumna. Cotton and grain, the main exports, are carried downwards; while rice, sugar, tobacco, and Manchester goods constitute the principal imports upwards. The manufactures consist of coarse cotton cloth and soapstone ornaments. There is only one metalled road, that between Hamírpur and Naugáon, 70 miles in length. The gross revenue in 1870-71 was £184,646; expenditure, £116,416. In 1871 the police force numbered 534 men, supplemented by 1953 village watchmen (*charkidárs*), maintained at a cost of £3058. The district contains only one jail: the average number of prisoners in 1850 was 400; 1860, 72; and 1870, 129. In 1870 the number of schools was 112, with 3066 pupils; the cost, £1354. The district is divided into 8 fiscal divisions (*pargánás*). The climate is dry and hot, owing to the absence of shade and the bareness of soil, except in the neighbourhood of the Mahoba lakes, which cool and moisten the atmosphere. The rainfall in 1869-70 was 37.1, and in 1870-71 38.1 inches.

History.—From the 9th to the 14th century this district was the centre of the Chandel kingdom, with its capital at Mahoba. The rájás adorned the town with many splendid edifices, remains of which still exist, besides constructing the noble artificial lakes already described. At the end of the 12th century Mahoba fell into the hands of the Mussulmans, who retained possession of it for 500 years. In 1680 the district was conquered by Chhatar Sál, the hero of the Bundelas, who assigned at his death one-third to his ally the peshwa of the Marhattás. Until Bundelkhand was constituted a British district in 1803, there was constant warfare between the Bundela princes and the Marhattá chieftains. The land had been impoverished by the long war carried on under Chhatar Sál, overrun and ravaged during the Marhattá aggression,

and devastated by robber chiefs, so that in 1842 it was reported to be utterly valueless. On the outbreak of the mutiny, Hamírpur was the scene of a fierce rebellion. All the principal towns were plundered by the surrounding native chiefs. Since then the condition of the district seems to have improved; but it has not yet recovered from the long anarchy of Marhattá rule.

HAMÍRPUR, the administrative headquarters of the above district, in 25° 58' N. lat. and 80° 11' 50" E. long., is situated on a tongue of land at the confluence of the Betwa and the Jumna, on the right bank of the latter river. It was founded, according to tradition, by Hamír Deo, a Karchuli Rájput expelled from Ulwar (Alwar) by the Mahometans. The town possesses little importance; there are no manufactures, and quite a limited trade in grain. Population in 1872, 7007.

HAMLET, the hero of Shakespeare's drama, is according to some interpreters an historical or quasi-historical personage, but according to others his story is a mere development or "precipitation" of the great Scandinavian system of mythology. The decision of this point is rendered all the more difficult as the only original authority for the facts (historical or mythological) is the Danish historian Saxo Grammaticus (d. 1204). Though Dr Vigfusson (prolegomena to the *Sturlunga Saga*, Oxford, 1878) concludes that the Hamlet legend was contained in the *Skjöldunga Saga* now lost, it is of course matter of question whether Saxo based this portion of his narrative on previous writings or collected his material from oral tradition.

According to Saxo, whose account is excerpted in Simrock's *Quellen des Shakespeare* (Bonn, 1870), and summarized in Latham's *Dissertations on Hamlet* (Lond., 1872, reprinted from *Transactions of the Roy. Soc. of Literature*, vol. x., new series), Hamlet's history is briefly as follows. In the days of Rörik, king of Denmark, Gervendill was governor of Jutland, and in this office he was succeeded by his sons Horvendill and Fengo. The former, returning with glory from a viking expedition in which he had defeated Koller, king of Norway, obtained the hand of Gerutha, Rörik's daughter, who in due course bore him a son Amléth. But Fengo, out of jealousy, murdered Horvendill with his own hand, and then persuaded Gerutha to become his wife, on the plea that he had committed the crime for no other reason than to avenge her of a husband by whom she had been hated. Amléth, afraid of sharing his father's fate, pretends to be imbecile, but the suspicion of Fengo puts him to various tests, which are related with all the inconsequent simplicity of the ordinary *Märchen*. Despatched to England in company with two attendants, who bear a letter instructing the king of that country to put him to death, he surmises the purport of their instructions, and secretly modifies the inscription on their "tablets" so that the king is requested to put them to death and to treat him with honour. By his wisdom he makes a deep impression on the king, and obtains the hand of the royal princess; but instead of settling in England he returns at the end of a year to Denmark, where he is supposed to be dead, just as the people are celebrating his obsequies. During the feast that follows he makes the courtiers all drink freely, and then, when they are heavy with wine and sleep, he pulls down over them the hangings of the hall, fixes these with pegs which he had sharpened and prepared in the early stage of his folly, and then setting fire to the building leaves the revellers to their fate. He next proceeds to the royal chamber to take vengeance on Fengo himself, who falls beneath the stroke of his own sword, for which Hamlet had substituted his own scabbard-fastened weapon. Returning to England for his wife, the hero finds that his father-in-law and Fengo had been under pledge to each other that the survivor should avenge the other's death if it resulted from violence; and his father-in-law, unwilling to make a direct attack on his life, send-

him to Scotland as proxy-suitor for the hand of a terrible queen Hermuthruda, who has put all previous wooers to death. But Hermuthruda happens to fall in love with Hamlet, and he returns to England to upbraid his father-in-law with his treachery. As king of Jutland he has to endure the grievous hostility of Vileketus, Rörík's successor, but at last determines, though well aware that he is doomed to death in the attempt, to engage with him in a decisive battle. He perishes, and his widow marries Vileketus.

According to Latham, who may be taken as the representative of the historical theory, there are really two Hamlets,—the Hamlet of Saxo's third book and the Hamlet of his fourth book, who have been confounded together. The former, who is the Shakespearean hero, he would identify with Olaf Kyrre, the Anlaf Cwiran of the Saxon Chronicle and the Amlaf Cuaran of the Irish Annals, whose name, having passed through England and Ireland, he supposes to have returned to Denmark in a form which is Latinized by Saxo as Amlethus; the latter he considers as the Hygelac of Beowulf, the Chochilaicus of Gregory of Tours, the Huhleike of the Heimskringla, and even the Havelok of English legend. "By a confusion between them as man and man, the bearers," he says, "of names as different as Olaf and Hygelac take a form out of which Amlethus is a probable educt." But this theory, which is expounded with more learning than lucidity, is hardly so much in favour as that of the mythological school.

That, in spite of the links by which Saxo has sought to connect its different portions with the authentic history of Denmark, the whole story was destitute of historical basis was maintained by P. E. Müller (*Critisk Undersøgelse af Danmarks og Norges Sagahistorie eller om Troværdigheden af Saxos og Snorros Kilder*, Copenhagen, 1823), and his conclusions in regard to the matter have been very generally accepted. Though Hamlet or Amleth himself is not mentioned in the earlier documents of the Scandinavian mythology—the only allusion to his existence being the phrase *Amløtha qvern*, or Hamleth's mill, applied to the sea in the Skaldskaparmál—his father; Horvendill or Orvandil (from *ör*, the spear, and *vandel*, skilful), appears in the great Scandinavian myths in connexion with Thor's contest with Hrungnir, and is further to be identified with the Orendel of German legend, whose memorial coat was afterwards christened the seamless coat of our Saviour at Treves, and whose name, which occurs also as Ernthelle, may possibly be the source of the more famous name of Tell. Hamleth's own name finds its explanation in the Norse *amr* or *aml*, toil (still used colloquially in Icelandic, *amla*, to toil), and *loti*, devoted to, and probably has reference to his mythic impersonation of the endless toil and travail of the sea. The various details of the story—not only improbable and impossible, but essentially stupid and trivial—lend themselves with remarkable readiness to the theory which explains them as versions of the tale, a thousand times retold, of the contests between summer and winter, sea and land, light and darkness. An elaborate exposition of the whole will be found in Zinzow's *Die Hamletsage art und mit verwandten Sagen erläutert*, Halle, 1877. It has been already stated that Saxo's is the only original authority; but proof of the popularity of the legend is found in the presence in Jutland of such names as Amelhede (*i.e.*, Hamlet's Heath), near Randers, Fegges Sund, that is, Fengo's Sound, and Feggesklint, that is, Fengo's Cliff, and in the fact that in modern Icelandic the word *amlothi* is a regular equivalent for an idiotic or stupid man. Nor are literary rifacimentos of the story wanting. The Icelanders have their Amløtha Saga, which is a free translation of Saxo, and their Ambales Saga, in which the matter is treated in a more romantic style. The story of Brian, given in Jon Arnason's *Islenzkur Dödsögur* (Leipsic, 1864, ii.), has the

same main features; and Dr Vigfusson, by whom it was discovered, is disposed to surmise that the legend may actually be of Celtic origin,—a supposition quite in keeping with other well-known facts in Icelandic history. It was taken down from the lips of Lady Hildur Arngrimsdotter, whose father was born in 1568. As Niels of Sorö in the 15th century made Hamlet more familiar to the Danes by his *Danske Rimkronike*, so the French story-teller Belleforest introduced him to a wider company in his *Cent Histoires tragiques*. That as early as 1587 or 1589 he had been represented on the English stage is shown by the well-known passage from Nash's preface to Greene's *Menaphon*, "He will afford you whole *Hamlets*, I should say, handfulls of tragical speeches."

HAMM, a town of Prussia, capital of a circle in the government district of Arnsberg, province of Westphalia, is situated at the junction of several railways, on the Lippe at its confluence with the Ahse, 22 miles N.W. of Arnsberg. It is enclosed by walls, but the ditches which formerly surrounded it have been filled up and converted into promenades. The principal buildings are two Catholic and two Evangelical churches, a gymnasium, a poorhouse, an orphanage, and an infirmary. The town is flourishing and rapidly increasing, and possesses very extensive wire factories (in connexion with which there are puddling and rolling works), foundries, machine works, and manufactories of gloves, baskets, wadding, leather, sausages, sago, starch, chemicals, sugar-of-lead, gum, lac, varnish, oil, and beer. The population in 1875 was 18,877.

Hamm, which became a town about the end of the 11th century, was originally the capital of the countship of Mark, and was fortified in 1226. It became a member of the Hanseatic League. In 1614 it was besieged by the Dutch, and in 1622 it was taken by Tilly, after which during the Thirty Years' War it was alternately in the hands of the imperial and the Hessian forces. In 1666 it came into the possession of Brandenburg. In 1761 and 1762 it was bombarded by the French, and in 1763 its fortifications were dismantled.

HAMMARSKÖLD, LORENZO (1785–1827), Swedish author, was born at Tuna, near Wimmerby, on the 7th of April 1785. He became a student at Upsala in 1801, but failed to take his degree in 1806. He therefore accepted a humble post at the royal library at Stockholm, with which institution he remained connected for many years. In 1804 he published an article on Tieck and Novalis, which attracted much attention, and was the means of founding the "Phosphoric School," as it was called, of poetry in Sweden. Hammersköld became the friend of Atterbom and antagonist of Wallmark, and in due time, by the bitterness of his tone, brought down on himself the scathing anger of Tegnér. In 1806 he published *Translations and Imitations of Poets, Old and New*, in the preface of which he denounced the classic Swedish writers with much force and wit, commending Goethe and Tieck to the young poets of the day. In 1808 appeared his trenchant *Critique of Schiller*, and in 1810 a volume of essays of a polemical kind. In 1813 Hammersköld published a collection of his poems, and in 1815 had to endure the ridicule of Tegnér in his brilliant satire of *Hammerspik*. In 1818 appeared the first part of Hammersköld's chief contribution to literature, his famous *Svenska Vitterheten*, a history of polite letters in Sweden, a book that was revised and republished after his death by Sondén, in 1833. He is chiefly remembered as a critic; his lyrics and his juvenile tragedy of *Prince Gustaf*, 1812, are of little value.

HAMME, a town of Belgium, in the province of East Flanders and the arrondissement of Termonde or Dendermonde, is situated on the right bank of the Durme, near its junction with the Scheldt, and 18 miles E.N.E. of Ghent. It contains grain and oil-mills, has manufactures of lace, ribbons, linen, starch, ropes, and cordage, and carries on trade in flax. Population (1876), 10,778.

HAMMER. This well-known tool stands quite without rival for producing the numberless effects which are due to the remarkable force of "impact." Of all the array of hand tools in use in the industrial arts it is undoubtedly the one that could least be dispensed with, and so it must have been from the very earliest days of handicraft. A hammer of some rude kind must have been as essential to the shaping of an arrow-head out of a flint, as is its modern representative to the forging of a bayonet out of a bar of steel.

Hammers to be used by hand are made of an endless variety of shapes, and of weights varying from a small fraction of an ounce to 28 or 30 lb. Of the various types now in use the differences are mainly due to the special requirements of the particular trades for which they are intended, but partly also to individual fancy. A few examples are given in fig. 1—*a* being the ordinary carpenter's hammer with a cross pane, *b* a claw hammer, *c* an engineer's, and *d* a shoemaker's hammer, which last has apparently retained its form for many generations. The same may also be said of the two others in the woodcut,

FIG. 1.—Varieties of Hand Hammer.

which are good examples of the roughness of the instruments with which results of almost incredible delicacy can be produced. Of these *e* is a favourite hammer used in the workshops of a London firm of goldbeaters, with which, together with others not less rude in appearance, gold is hammered out into leaves of such exceeding thinness that 250,000 are required to make up the thickness of an inch. Extraordinarily ill-shaped as *f*, the file-cutter's hammer, looks, yet with this and a simple chisel the teeth of files are cut by hand with a precision with which no machinery has as yet been able to compete, at least in England.

Hand-hammers and sledge-hammers being rigidly limited as to weight by the trifling power which one man—or at most two men—can bring to bear upon them, it long ago became obviously desirable to obtain the force of impact from some more powerful source than human muscles, so that the weight of hammer heads might be largely increased and their blows made proportionately more effective. The first step taken in this direction seems to have been the introduction of the "Hercules," a ponderous mass of iron attached to a vertical guide rod, which was lifted originally by a gang of men with ropes, but afterwards by steam power, and allowed to fall by its own weight. This was a fairly efficient tool for forging large anchors and for similar purposes, the strength of the blow and the point at which it was delivered being easily regulated. But as the demand for wrought iron increased, the necessity for more rapid as well as more powerful hammers to aid in its manu-

facture increased also. The lift or helve hammer (fig. 2) and the tilt hammer (fig. 3) thus came into use, and under these forms hammers may be said to have ranked for

FIG. 2.—Lift Hammer.

the first time as true machine tools. Each of these consists of a heavy head attached to a beam mounted on gudgeons, which is lifted at regular intervals by suitable cams or pins

FIG. 3.—Tilt Hammer.

carried by a revolving shaft driven by steam or other power, their chief points of difference being the relative position of the gudgeons and the portion of the beam at which the

FIG. 4.—Steam Hammer.

power is applied, as shown in the diagrams. Heavy blows are thus obtained with the one, and lighter but much more rapid blows with the other, both, however, invariable in their intensity, the lift being always to one fixed height.

In the steam hammer (fig. 4), which was first patented by Nasmyth in the year 1842, this objection is completely obviated. By the simple device of attaching the hammer head to the lower end of the rod of a piston working in an inverted steam cylinder, he produced a machine capable of being made to deliver its blows with a force to which no limit has yet been found, and yet so perfectly under control as to be able to crack a hazel nut without injuring the kernel. To the introduction of this invaluable tool is due more than to any other single cause the power which we now possess of producing the forgings in iron and steel which are demanded by the arts of modern times; and in one or other of its many forms it is now to be met with in every workshop in which heavy work is carried on. Many modifications of the Nasmyth steam hammer have been introduced. In one of these steam pressure has been applied above the piston to intensify the blow, it being only used in the original form for lifting the "tup" and piston and for regulating their descent. In another the piston and piston-rod have been attached to the framing, and the cylinder made movable, its weight being thus added to that of the hammer.

Duplex hammers differ materially from the ordinary steam hammer, inasmuch as no anvil is necessary,—two hammer heads of equal weight (and for some purposes they weigh only a few pounds, for others as much as 30 tons) being made to deliver horizontal blows of equal force simultaneously on opposite sides of the forging, which thus receive perfectly equal treatment. The importance of this may be gathered from the fact that every increase in the weight of the vertical steam hammer necessitates a very much larger increase in the weight and solidity of the anvil which is necessary to afford the requisite inertia for resisting the blow. For instance, the anvil of a 40-ton hammer now in use at Woolwich Arsenal weighs upwards of 160 tons, and has nearly 500 tons of iron in its foundation, whereas the anvil of an 80-ton hammer of which a full-sized model was amongst the most striking objects at the Paris Exhibition of 1878, is of no less than 20 tons weight.

The recent growth of steam hammers to the enormous size just mentioned is due chiefly to the large dimensions, independently of the mere weight, of the forgings which have now to be made for heavy ordnance and for other purposes. As long as the thickness of a forging is moderate, the reaction of the anvil acting upon its under side has an effect not greatly inferior to that of the hammer on the upper side. But with every increase in thickness some of this reaction is lost and the effect of the blow is more and more confined to the outer portions of the mass, which thus receive more than their share of treatment at the expense of the central portions. On this account the difficulty of obtaining thick forgings thoroughly sound throughout their substance is very great, and it seems as if we had now reached the limit beyond which the hammer cannot be advantageously applied for their production. It has been found indeed in the case of large shafts that dispensing altogether with the central portion, thus making them tubular instead of solid, is accompanied by an increase in their strength, owing to the possibility of thus forging the metal uniformly throughout. But a much more widely applicable remedy, and one which will doubtless come into general use for heavy work, is the substitution of hydraulic or other pressure for the force of impact, a system which has lately been employed by Sir Joseph Whitworth with wonderfully good results. The reason of the superiority of its effect seems to be mainly this, that a certain amount of time is essential for completing the "flow" of the metal which it is the object of forging to induce. Under continuous pressure this flow can take place uniformly

throughout the mass, whereas the instantaneous blow of the hammer, though it acts violently on the surface particles, and to a decreasing extent on the adjacent ones, is entirely expended before the action has had time to reach those at the centre, so that unequal density and consequent weakness is the result. For massive forgings therefore the old saying can be no longer accepted that "there is no machine like a hammer." (C. P. B. S.)

HAMMERFEST, the most northern town in Europe, is situated in the department of Hammerfest in the province of Finmark, on the western side of the island of Kvalø (i.e., "Whale Island"), which lies off the north-western coast of Norway. Its latitude is 70° 39' 15", and the sun stays for two months above its horizon. Though a small place of about 2100 inhabitants, it is the seat of a considerable trade, in which not only Norwegian and Danish but English, German, and particularly Russian vessels are engaged. About thirty small ships are sent out from Hammerfest every spring to Spitzbergen to take part in the fisheries and walrus hunting. Train oil from the liver of the *Scymnus microcephalus* and cod-liver oil are manufactured in the town. The exports, among which salted fish occupies the principal place, amounted in 1876 to the value of 1,629,500 crowns (£90,528), and the imports, chiefly salt and coal, to 721,700 (£40,094). On the Euglenæs or Birds' Cape, which protects the harbour on the north, there stands a column with an inscription in Norse and Latin, stating that Hammerfest was one of the stations of the expedition for the measurement of the arc of the meridian. Nor is this its only association with science; for it was one of the spots chosen by Captain Sabine for his series of pendulum experiments. The ascent of the Tyven or Diebsberg in the neighbourhood is usually undertaken by travellers.

HAMMER-HEAD. See SHARK.

HAMMER-PURGSTALL, JOSEPH VON (1774-1856), was born at Gratz in 1774, and after some training in the Oriental academy of Vienna entered the Austrian diplomatic service. He was the son of Joseph Johann von Hammer, and it was not till 1835, when he had inherited the estates of the countess of Purgstall (in Styria), that he received the title Baron von Hammer-Purgstall, by which he is generally known. His youth and early manhood were passed in the Levant, where he bent all his energies to the task of improving his acquaintance with Oriental literature, in which as early as 1796 he proved his interest by the translation of a Turkish poem. He did not again come forward as an author till 1804, when his *Encyclopædia of Oriental Learning* appeared, a work whose ambitious character was so diffidently felt by its author that he feared to put his name to it. From that time there was little pause in his literary productiveness. For fifty years he wrote incessantly on the most diverse subjects, and his works were composed in most of the languages of Europe. He published numerous texts and translations of Arabic, Persian, and Turkish authors; compiled histories of Persian poetry, Turkish poetry, and Arabic literature; brought the poems of Hâfiz, Mutanebbi, Baki, and Ibn-el-Fâridh within the reach of European readers; published travels in Turkey and Austria; wrote the history of the Tatar races, the Krim Klans, the Golden Horde, the Russians, and the Ottoman Turks; formed a biographical gallery of Eastern celebrities; put forth theories about every possible subject in the wide range of Oriental learning, discussing the *Arabian Nights*, Arab music, Mahometan theology, Egyptian papyri, gnostic coffrets, Arabic grammar, Eastern antiquities, the sect of the Assassins, the sieges of Vienna, the Knights Templars, and Spenser's sonnets, which he translated into German. Von Hammer did for Germany the same work that Sir William

Jones did for England. He showed that Oriental subjects were not to be studied merely so far as they were connected with biblical theology, but were a worthy object of research for their own sake. For more than fifty years he persisted in introducing Eastern authors and Eastern topics to the general reader, and there was a time when no Orientalist was more widely known and admired. As Jules Mohl said—"C'était le doyen de la littérature orientale, le premier associé que la Société (Asiatique de Paris) ait tenu à l'honneur d'inscrire sur sa liste, et le plus zélé, le plus fertile, et le plus célèbre des hommes qui se sont voués, de notre temps, à la culture des lettres orientales."

It was natural that a scholar who traversed so large a field and wrote so rapidly should lay himself open to the criticism of specialists, and no man was more severely handled by his critics than Von Hammer, to whom Diez, for example (in *Unfug und Betrug*, 1815), devotes nearly 600 pages of heavy abuse. Von Hammer was undoubtedly inaccurate and superficial at times; he attempted more than he could possibly achieve with thoroughness, and was in the habit of giving his own whimsical view of matters about which he knew next to nothing; and he used to offend his critics as much by his Oriental florid style and want of method as by the occasional inaccuracy of his facts and the inconsequence of his deductions. But in spite of his faults he did more for Oriental studies than most of his critics put together.

When he was seventy-six years of age he planned a second edition of his *Encyclopædia of Oriental Learning*, and designed a "preliminary" series of twelve volumes which should clear the ground by expounding the history of Arabic literature, and for the last seven years of his life he regularly put forth his annual volume. Jules Mohl, going to see him, found the old man hard at work, helped by no colleague, and disdaining the aid of an amanuensis. His early travels in the Levant, and then his busy life at Vienna, where he held the post of court-interpreter, saved him from the crushing influence of solitary study; and to the last he maintained his singular buoyancy of mind. "C'était un homme généreux, franc jusqu'à l'imprudence, hardi, bouillonnant d'esprit, aimable jusqu'à la coquetterie, doué d'une faculté de travail rare, ambitieux dans les grandes et les petites choses, et d'une vivacité inconcevable—vivacité qui fut la source de sa bonne et de sa mauvaise fortune." So Mohl pictured him in his address to the Société Asiatique in 1857, when he recorded the death of Von Hammer on November 23, 1856, at the age of eighty-two, a hard worker to the last, like his younger but greater English contemporary Lane, with whom he came into collision in a friendly way on the subject of the origin of *The Thousand and One Nights*.

Von Hammer's principal works are his *Geschichte des osmanischen Reiches*, 10 vols., 1827 (2d ed., 1831-6), translated into French (1835 and 1840); *Geschichte der osmanischen Dichtkunst*, 4 vols., 1836; *Literatur-Geschichte der Araber* (unfinished), 7 vols., 1850-6; *Les Origines Russes*, 1827; *Geschichte der Goldenen Horde*, 1840; *Geschichte der Ithane*, 1842; *Geschichte der Chané der Krim*, 1856; *Geschichte der Assassinen*, 1818; *Constantinopolis und der Bosphorus*, 1822; *Encyklopädische Uebersicht der Wissenschaften des Orients*, 1804. Texts and translations of—*Eth-Thaqlabi*, Arab. and Germ., 1829; *Ibn Wahshiyah, History of the Mongols*, Arab. and Engl., 1806; *El-Wassaf*, Pers. and Germ., 1856; *Esch-Schehstani's Rosenstolz des Gehcimnisses*, Pers. and Germ., 1838; *Ez-Zamakhsheri, Goldene Halzbänder*, Arab. and Germ., 1835; *El-Ghazali, Hujjet-el-Islam*, Arab. and Germ., 1838; *El-Hamawi, Das arab. Hohe Lied der Liebe*, Arab. and Germ., 1851. Translations of—*El-Mutanebbi's Poems*; *Er-Resmi's Account of his Embassy*, 1809; *Contes inédits des 1001 Nuits*, 1828. Besides these and smaller works, Von Hammer contributed numerous essays and criticisms to the *Fundgruben des Orients*, which he edited; to the *Journal Asiatique*; and to many other learned journals; above all to the *Transactions of the Akademie der Wissenschaften of Vienna*, of which he was mainly the founder; and he translated

Elviya Effendi's *Travels in Europe*, for the English Oriental Translation Fund. For a fuller list of his works, which amount in all to nearly 100 volumes, see *Comptes Rendus of the Acad. des Inscriptions et des Belles Lettres*, 1857. (S. L. P.)

HAMMERSMITH, a town and parish in the county of Middlesex, situated on the north bank of the Thames, 3½ miles S.W. of Hyde Park corner, and now connected with London by continuous lines of streets. The bridge across the Thames at Hammersmith, completed in 1827 at a cost of £80,000, was the earliest suspension bridge erected near London. Formerly Hammersmith was celebrated for its nurseries and market gardens, but these have almost entirely given place to buildings. In the neighbourhood there are a number of fine residences. The principal public buildings are the parish church of St Paul, consecrated in 1631 and restored in 1864, containing a number of interesting monuments; the Latymer schools, founded by Edward Latymer in 1624; the Godolphin school, founded in the 16th century, and rebuilt as a grammar school in 1862, with accommodation for 200 boys; the Roman Catholic theological institute, founded originally as a school for ladies in 1669; the convent of the Good Shepherd, with an asylum for penitent women; the convent of Little Daughters of Nazareth; the Roman Catholic reformatory, the town-hall, the office of the board of works, and the West London hospital. In the district there are distilleries, lead-mills, oil-mills, coach factories, boat-building yards, and the works of the West Middlesex Water Company. The population of the parish in 1861 was 24,519, and in 1871 42,691. Hammersmith falls within the limits of the metropolitan district, and forms part of the parliamentary borough of Chelsea.

HAMMOND, HENRY (1605-1660), a learned royalist divine of the Church of England, was born at Chertsey in Surrey, August 18, 1605. He was educated at Eton, whence in his fourteenth year he passed to Magdalen College, Oxford, becoming demy or scholar in 1619, and fellow in 1625. After graduating in arts he turned his attention to divinity; in 1629 he entered holy orders, and in 1631 became bachelor of divinity. Two years afterwards, in preaching before the court, he won the approval of the earl of Leicester, who in the same year presented him to the living of Penshurst in Kent. Hammond received his doctor's degree in 1639, and in 1643 was promoted to the dignity of archdeacon of Chichester. He was a member of the convocation of 1640, and also, but nominally only, of the Westminster Assembly of divines, which began its sittings in 1643. In the latter year Dr Hammond was concerned in the unsuccessful rising at Tunbridge in favour of King Charles I., and was obliged to flee in disguise to Oxford, then the royal headquarters. There he spent much of his time in writing, though he accompanied the king's commissioners to London, and afterwards to the ineffectual convention at Uxbridge in 1645, where he disputed with the Presbyterian Vines. In his absence he was appointed canon of Christ Church and public orator of the university. These dignities he relinquished for a time in order to attend the king as chaplain during his captivity in the hands of the parliament. When Charles was deprived of all his loyal attendants at Christmas 1647, Hammond returned to Oxford and was made sub-dean of Christ Church, only, however, to be removed from all his offices in 1648 by the parliamentary visitors, who imprisoned him for ten weeks. Afterwards he was permitted, though still under quasi-confinement, to retire to the house of Sir Philip Warwick at Clapham in Bedfordshire. In 1650, having regained his full liberty, Hammond betook himself to the friendly mansion of Sir John Pakington, at Westwood, in Worcestershire, where he died on April 25, 1660, just on the eve of his preferment to the see of Worcester.

Independently of his works, Hammond possessed qualities entitling him to be remembered long after the former are forgotten. He was an excellent preacher. Charles I. pronounced him the most natural orator he had ever heard. His range of reading was extensive. A diligent scholar and a copious writer, he left no time for idleness, which he regarded as the heaviest burden and most dangerous temptation of man.

His writings, published in 4 vols. fol., 1674-84, consist for the most part of controversial sermons and tracts. The best of them are his *Practical Catechism*, first published in 1644; his *Paraphrase and Annotations on the New Testament*; and an incomplete work of a similar nature on the Old Testament. His *Life*, written by Bishop Fell, and prefixed to the collected *Works*, has been reprinted in vol. iv. of Wordsworth's *Ecclesiastical Biography*. See also Lloyd's *Memoires*, 1668, and *Life of Henry Hammond*, by the Rev. G. G. Perry.

HAMON, JEAN LOUIS (1821-1874), one of the best known of French painters under the second empire, was born at Plouha on 5th May 1821. At an early age he was destined to the priesthood, and placed under the care of the brothers Lamennais, but his strong desire to become a painter finally triumphed over family opposition, and in 1840 he courageously left Plouha for Paris,—his sole resources being a pension of five hundred francs, granted him for one year only by the municipality of his native town. At Paris Hamon received valuable counsels and encouragement from Delaroche and Gleyre, and in 1848 he made his appearance at the Salon with *Le tombeau du Christ* (Musée de Marseille), and a decorative work, *Dessus de Porte*. The works which he exhibited in 1849—*Une Affiche Romaine*, *L'Égalité au Séraïl*, and *Perroquet jasant avec deux jeunes Filles*—obtained no marked success. Hamon was therefore content to accept a place in the manufactory of Sèvres, but an enamelled casket by his hand having attracted notice at the London International Exhibition of 1851, he received a medal, and, re-inspired by success, left his post to try his chances again at the Salon of 1852. *La Comédie Humaine*, which he then exhibited, turned the tide of his fortune, and *Ma sœur n'y est pas* (purchased by the emperor) obtained for its author a third class medal in 1853. At the Paris International Exhibition of 1855, when Hamon re-exhibited the casket of 1851, together with several vases and pictures of which *L'Amour et son Troupeau*, *Ce n'est pas moi*, and *Une Gardense d'Enfants* were the chief, he received a medal of the second class, and the ribbon of the legion of honour. In the following year he was absent in the East, but in 1857 he reappeared with *Boutique à quatre Sous*, *Papillon enchainé*, *Cantharide esclave*, *Dévideuses*, &c., in all ten pictures; *L'Amour en visite* was exhibited to the Salon of 1859, and *Vierge de Lesbos*, *Tutelle*, *La Volière*, *L'Escamoteur*, and *La Sœur aînée* were all seen in 1861. Hamon now spent some time in Italy, chiefly at Capri, whence in 1864 he sent to Paris *L'Anrore* and *Un Jour de Fiançailles*. The influence of Italy was also evident in *Les Muses à Pompéi*, his sole contribution to the Salon of 1866, a work which enjoyed great popularity and was re-exhibited at the International Exhibition of 1867, together with *La Promenade*, and six other pictures of previous years. His last work, *Le triste Rivage*, appeared at the Salon of 1873. It was painted at St Raphael, where Hamon had finally settled in a little house on the shores of the Mediterranean, close by Alphonse Karr's famous garden. In this house he died on the 29th of May 1874, and the contents of his studio and portfolios were dispersed at an obscure sale—thinly attended—for an almost nominal sum. Hamon had made his own a quiet place amongst these workers who since the days of Vien and David have been trying to bring home to us something of the pictorial aspect of classic time. He had neither the power nor the learning which might have enabled him to

give to that aspect any very real shape, nor was the side of human life with which he was most concerned weighty or important. He especially loved the gestures of children and their little ways,—now comic, now cunning, but always naive, and always full of charms. Dressed in classic fashion they play on the canvas of Hamon, with endless fanciful alterations, the same nursery comedies of which *Ma sœur n'y est pas* is one of the best examples. The painter's very mannerisms, his pale colour, and the hazy atmosphere which pervades his often rather empty field, enhance the graceful unreality of these little creatures, who are not quite classic loves nor yet altogether human babies.

HAMPDEN, JOHN (1594-1643), the eldest son of William Hampden of Great Hampden in Buckinghamshire, by Elizabeth, second daughter of Sir Henry Cromwell, and aunt of Oliver, the future Protector, was born in 1594. By his father's death, when he was but a child, he became the owner of a good estate, and a ward of the crown. He was educated at the grammar school at Thame, and in 1609 he became a commoner of Magdalen College, at Oxford. In 1613 he was admitted a student of the Inner Temple, and in 1619 he married Elizabeth Symeon. He first sat in parliament for the borough of Grampound in 1621. From that time he was a member of every succeeding parliament till he died.

To the biographer who does not wish to become an historian under the pretence of narrating the incidents of his hero's life, Hampden's career must appear to give little scope for narrative. The letters which he left behind him are few. His speeches are scarcely more numerous and are extremely brief. In the early days of his parliamentary career he was content to be overshadowed by Eliot, as in its later days he was content to be overshadowed by Pym and to be commanded by Essex. Yet it is Hampden, and not Eliot or Pym, who lives in the popular imagination as the central figure of the English revolution in its earlier stages. It is Hampden whose statue rather than that of Eliot or Pym has been selected to take its place in St Stephen's Hall as the noblest type of the parliamentary opposition, as Falkland's has been selected as the noblest type of parliamentary royalism.

Something of Hampden's fame no doubt is owing to the position which he took up as the opponent of ship-money. But it is hardly possible that even resistance to ship-money would have so distinguished him but for the mingled massiveness and modesty of his character, his dislike of all pretences in himself or others, his brave contempt of danger, and his charitable readiness to shield others as far as possible from the evil consequences of their actions. Nor was he wanting in that skill which enabled him to influence men towards the ends at which he aimed, and which was spoken of as subtlety by those who disliked his ends.

During the last two parliaments of James and the first three parliaments of Charles, Hampden did not, so far as we know, open his lips in public debate, but he was increasingly employed in committee work, for which he seems to have had a special aptitude. In 1626 he took an active part in the preparation of the charges against Buckingham. In January 1627 he was bound over to answer at the council board for his refusal to pay the forced loan. Later in the year he was committed to the gate-house, and then sent into confinement in Hampshire, from which he was liberated just before the meeting of the third parliament of the reign, in which he once more rendered useful but unobtrusive assistance to his leaders.

When the breach came in 1629 Hampden is found in epistolary correspondence with the imprisoned Eliot, discussing with him the prospects of the Massachusetts colony, or rendering hospitality and giving counsel to the patriot's sons now that they were deprived of a father's personal care,

It was not till 1637, however, that his resistance to the payment of ship-money gained for his name the lustre which it has never since lost. Seven out of the twelve judges sided against him, but the connexion between the rights of property and the parliamentary system was firmly established in the popular mind.

In the Short Parliament of 1640 Hampden stood forth amongst the leaders. During the eventful months which followed, when Strafford was striving in vain to force England, in spite of its visible reluctance, to support the king in his Scottish war, rumour has much to tell of Hampden's activity in rousing opposition. It is likely enough that the rumour is in the main true, but we are not possessed of any satisfactory evidence on the subject.

In the Long Parliament, though Hampden was by no means a frequent speaker, it is possible to trace his course with sufficient distinctness. Unwearied in attendance upon committees, he was in all things ready to second Pym, whom he plainly regarded as his leader. In the earlier proceedings of the Commons there was practically unanimity in the House, though a difference afterwards arose as to the form in which the attack upon Strafford should be conducted. All were agreed in desiring that the constitution should rest upon a combination between the king and the two Houses, and that legal questions in which the king was concerned should be decided only by the judges of the ordinary courts.

There was another point on which there was no agreement. A large minority wished to retain Episcopacy, and to keep the Common Prayer Book unaltered, whilst the majority were at least willing to consider the question of abolishing the one and modifying the other. On this subject the parties which ultimately divided the House and the country itself were fully formed as early as February 8, 1641. The details of the contest between Episcopacy and Presbyterianism will be more fitly told in connexion with the life of Pym. It is enough to say that Hampden fully shared in the counsels of the opponents of Episcopacy. It is not that he was a theoretical Presbyterian, but the bishops had been in his days so fully engaged in the imposition of obnoxious ceremonies that it was difficult if not impossible to dissociate them from the cause in which they were embarked. Closely connected with Hampden's distrust of the bishops was his distrust of monarchy as it then existed. The dispute about the church therefore soon attained the form of an attack upon monarchy, and, when the majority of the House of Lords arrayed itself on the side of Episcopacy and the Prayer Book, of an attack upon the House of Lords as well.

No serious importance therefore can be attached to the offers of advancement made from time to time to Hampden and his friends. Charles would gladly have given them office if they had been ready to desert their principles. Every day Hampden's conviction grew stronger that Charles would never abandon the position which he had taken up. He was therefore a warm supporter of the Grand Remonstrance, and was chosen out to be one of the five impeached members whose attempted arrest brought at last the opposing parties into open collision. In the angry scene which arose on the proposal to print the Grand Remonstrance it was Hampden's personal intervention which prevented an actual conflict, and it was after the impeachment had been attempted that Hampden laid down the two conditions under which resistance to the king became the duty of a good subject. Those conditions were an attack upon religion, and an attack upon the fundamental laws. There can be no doubt that Hampden fully believed that both those conditions were fulfilled at the opening of 1642.

When the civil war began Hampden levied a regiment

of Buckinghamshire men for the parliamentary cause. In the earlier operations of the war, and in the undecided fight of Edgehill, he bore himself gallantly and well. But it is not on his skill as a regimental officer that Hampden's fame rests. In war as in peace his distinction lay in his power of disentangling the essential part from the non-essential. In the previous constitutional struggle he had seen that the one thing necessary was to establish the supremacy of the House of Commons. In the military struggle which followed he saw, as Cromwell saw afterwards, that the one thing necessary was to beat the enemy. He protested at once against Essex's hesitations and compromises. In the formation of the confederacy of the six associated counties, which was to supply a basis for Cromwell's operations, he took an active part. His influence was felt alike in parliament and in the field. But he was not in supreme command, and he had none of that impatience which often leads able men to fail in the execution of orders of which they disapprove. His precious life was a sacrifice to his unselfish devotion to the call of discipline and duty. On June 18, 1643, when he was holding out on Chalgrove Field against the superior numbers of Rupert till reinforcements arrived, he received two carbine balls in the shoulder. Leaving the field he reached Thame, and after nearly six days he died on the 24th praying for his country and his king.

(s. r. g.)

HAMPDEN, RENN DICKSON (1793-1868), bishop of Hereford, was born at Barbados, where his father was colonel of the local militia, in 1793, and after receiving a private school education under Dr Rowlandson, vicar of Warminster, Wiltshire, entered as a commoner at Oriel College, Oxford, in 1810. Having taken his B.A. degree with first-class honours in both the classical and mathematical schools in 1813, he in the following year obtained the chancellor's prize for a Latin essay "On the Office of the Ephors at Sparta," and shortly afterwards he was elected to a fellowship in his college, Keble, Newman, and Arnold being among the number of his contemporaries. Having left the university in 1816 he held successively the curacies of Newton, Faringdon, and Hackney, and in 1827 he published *An Essay on the Philosophical Evidence of Christianity*, followed by a volume of *Parochial Sermons illustrative of the importance of the Revelation of God in Jesus Christ* (1828). In 1828 he returned to Oxford as tutor of Oriel, and after having twice acted as public examiner in classics, he was selected to preach the Bampton lectures in 1832, when he chose for his subject *The Scholastic Philosophy considered in its Relation to Christian Theology* (1833; 3d ed. 1848). Notwithstanding a charge of Arianism now brought against him by the Tractarian party, he in 1833 obtained the principalship of St Mary's Hall, and in 1834 the chair of political economy; nor did a university statute of censure against him on the ground of the supposed heterodoxy of the Bampton lectures avail to check his promotion to the regius professorship of divinity in 1836. There resulted a widespread and violent though ephemeral controversy, after the subsidence of which he published a *Lecture on Tradition*, which has passed through several editions, and a volume on *The Thirty-nine Articles of the Church of England*. His nomination by Lord John Russell to the vacant see of Hereford in December 1847 was again the signal for a violent and organized opposition; and his consecration in March 1848 took place in spite of a remonstrance by many of the bishops and the resistance of Dr Merewether, the dean of Hereford, who went so far as to vote against the election when the *consé déline* reached the cathedral. As bishop of Hereford Dr Hampden made no change in his long formed habits of studious seclusion, and his episcopate was not characterized in a special degree by any form of churchly

activity or zeal. Among the more important of his later literary performances were the articles on Aristotle, Plato, and Socrates, contributed to the eighth edition of the *Encyclopædia Britannica*, and afterwards reprinted with additions under the title of *The Fathers of the Greek Philosophy* (Edinburgh, 1862). In 1866 he had a paralytic seizure which unfitted him for severe mental exertion, and he died at London on the 23d of April 1868.

HAMPSHIRE, HANTS, or SOUTHAMPTON (most anciently *Hamtanscire*, in Domesday book *Hantesshire*, and in the documents of the Middle Ages *Sudhamtescire*, *Sudhamton-sire*, and *Sudenhamptonsire*), a maritime county in the south of England, is situated between 50° 34' and 51° 22' N. lat. and 0° 43' and 1° 54' W. long., and is bounded on the N. by Berkshire, on the E. by the counties of Surrey and Sussex, on the S. by the English Channel, and on the W. by Wiltshire and Dorsetshire. It is of an irregular quadrilateral form, and its greatest breadth from north to south, not including the Isle of Wight, is 46 miles, and its greatest breadth from east to west 41 miles. The total area comprises 1,032,105 imperial acres (mainland portion 933,764 acres, Isle of Wight 93,341), or nearly 1613 square miles. Hampshire in its general aspect presents a beautiful variety of gently rising hills and fruitful valleys, adorned with numerous mansions and pleasant villages, and interspersed with extensive woodland. Two ranges of low chalk hills, known as the North and South Downs, enter the county from Surrey and Sussex respectively, and traverse it in a north-westerly direction into Wiltshire and Berkshire, forming in the north-western corner of the county several picturesque eminences, from which some fine views are obtained. The highest of these summits is Siddown Hill, Highclere, 940 feet. The northern and north-eastern portion of the county, comprising more than 100,000 acres, is in the basin of the Thames; a large portion of the southern district is in the Southampton or Isle of Wight basin; and a portion to the west is in the basin of Wilts and Dorset. The south-western corner from Southampton Water is almost wholly occupied by the New Forest. The coast on the whole is low and irregular. The most easterly part forms a large bay containing Hayling Island and Portsea Island, which divide it into Chichester harbour, Langston harbour, and Portsmouth harbour. From the south-western extremity of Portsmouth harbour it runs about 18 miles inland in a north-west direction, and forms Southampton Water, which has a western shore about 10 miles in length, and an average breadth of nearly 2 miles at high water. From Southampton Water its line is continued irregularly in a south-western direction—for nearly one half of its extent fronting the Isle of Wight, and in its western half forming Christchurch Bay and part of Poole Bay.

Rivers and Canals.—The principal rivers are the Avon, the Boldre, the Exe, the Test with its tributary the Anton, the Itching, and the Hamble. The Avon in the south-west of the county has its source in Wiltshire, and passing Fordingbridge and Ringwood empties itself into Christ Church Bay, where it is joined by the Stour, which rising in Dorset crosses the south-west corner of Hampshire. The Boldre takes its rise in the New Forest, and after collecting the water of several brooks falls into Lymington creek. The Exe near the eastern extremity of the New Forest falls into the Solent at Beaulieu. The Test rises near Overton, and after its junction with the Anton at Fullerton passes Stockbridge and Romsey, and forms the head of Southampton Water. The Itching rises near Alresford, and flowing by Kingsworthy, Winchester, and Twyford falls into the Southampton Water to the north of Southampton. The Hamble rises near Bishop's Waltham, and after a course of about 10 miles falls into the South-

ampton Water. The Wey, the Enbourne, the Loddon, and the Blackwater have their rise in the north part of the county, but soon pass into Berkshire.

There is one canal, Basingstoke, begun in 1778 and completed in 1794 at a cost of £100,000. It is 37 miles in length and terminates in the river Wey, in Surrey, near its junction with the Thames. Andover canal, begun in 1789, was filled up in 1858 and converted into a railway, forming a junction with the London and Exeter at Andover.

Geology and Soil.—With the exception of the northern and north-eastern corner occupied by the basin of the Thames, another portion about 8 miles in breadth extending along the eastern side, and the New Forest in the south-west, with a small portion to the north of it, Hampshire is occupied by the Chalk formation which runs from Sussex and Surrey north-east into Wilts and Berks. This middle district has a length from north to south of about 22 miles and a breadth from east to west of between 20 and 30 miles. Its soil is in some places of considerable depth, and produces good crops of all kinds, but a great part of it is so thin as to be unfitted for the plough, and is used as sheep pasture. The basin of the Thames to the north of this district is principally strong brown and grey loam, with a considerable number of marshes. The eastern portion forming the Vale of Petersfield, and comprising only about 50,000 acres, rests on the Wealden formation, and is a grey sandy loam provincially called "malmy" land, lying on a soft sand rock. The southern portion, which includes the ancient Forest of Bere, Waltham Chase, and the New Forest, consists principally of light sandy and gravelly loams intermixed with clay and brick earth, resting chiefly on argillaceous and calcareous marl.

Agriculture.—According to the Agricultural Statistics for 1879, the total area of arable land was 706,927 imperial acres, of which 247,958 were under corn crops, 135,982 under green crop, 112,815 under rotation grasses, 184,141 permanent pasture, and 22,967 fallow. The acreage under woods was 87,229. The principal grain crop is wheat, for which Hampshire enjoys a great celebrity. Its acreage has been gradually increasing, and in 1879 was 100,090. The acreage of barley and oats was 66,228, and 64,957 respectively. Barley is usually sown after turnips, and is more grown in the uplands than in the lower levels. Beans and pease are only grown to a small extent, the acreage in 1879 being respectively 4633 and 10,092. On account of the number of sheep pastured on the uplands a large breadth of turnips is grown, their acreage in 1879 being 81,472. Potatoes are not cultivated beyond what is necessary for home supplies, and had an acreage of only 5039. Rotation grasses are grown chiefly in the uplands, and their acreage is greater than in any other of the southern counties of England. Sanfojn is the grass most largely grown, as it is best adapted to land with a calcareous subsoil. In the lower levels no sanfojn and scarcely any clover is grown, the hay being supplied from the rich water meadows, which are managed with great skill and attention, and give the best money return of any lands in the county. Where a rapid stream of water can be passed over them during the winter it seldom becomes frozen, and the grasses grow during the cold weather so as to be fit for pasture before any traces of vegetation appear in the surrounding fields. Hops are extensively grown in the eastern part of the county bordering on Surrey. Their acreage in 1879 was 3064. Farming is generally conducted on the best modern principles, but owing to the varieties of soil there is perhaps no county in England in which the rotation observed is more diversified, or the processes and methods more varied. Most of the farms are large, and there is a considerable number of model farms. The waste land has been mostly brought under tillage, but a very large acreage of the ancient forests is still occupied by wood. New Forest has 60,000 acres under wood, in addition to which there are in the east Woolmer Forest (5949) and Alice Holt (2744), in the south-east the Forest of Bere (11,000) and Waltham Chase (2000), and in the Isle of Wight Parkhurst Forest (3000). The New Forest was originally formed by William the Conqueror in 1079 after the battle of Hastings, and the greater part of it belongs to the crown. The trees of the forest are principally beech and oak. The oaks, many of which are some hundred years old, do not grow to a great height, but shoot out strong crooked branches which give them a very picturesque appearance. Formerly they were chiefly used for the ships of the royal navy. Herds of small ponies similar to those of Shetland and the Hebrides are still reared in the Forest. It also contains abundance of deer.

and at one time it was famed for its pigs. The honey of the county enjoys a special celebrity.

The number of cattle has increased with the improved facilities for railway transport, and in 1879 was 66,059, or an average of 9·3 to every 100 acres under cultivation, as compared with 16·9 for England and 21·0 for the United Kingdom. Of these the number of cows and heifers in milk or in calf was 35,128. The cattle are of no distinctive breed. The number of horses, to the breeding and rearing of which much attention is paid, was 29,247 in 1879, or an average of 4·1 to every 100 acres under cultivation, as compared with 4·5 for England and 4·1 for the United Kingdom. The number of sheep in 1879 was 552,041, or an average of 78·2 to every 100 acres under cultivation, as compared with 75·3 for England and 68·0 for the United Kingdom. The original breed was white-faced with horns, but most of the flocks now are of a Southdown variety which have acquired certain distinct peculiarities, and are known as "short wools" or "Hampshire downs." The number of pigs in 1879 was 57,122, or an average of 8·0 to every 100 acres, as compared with 7·2 for England and 6·7 for the United Kingdom. The breeding and fattening of pigs has long been a most important part of Hampshire industry. The original breed of pigs has been improved by crossing with Berkshire, Essex, and Chinese pigs. In the vicinity of the forests the pigs are fed on acorns and beechmast, and the pork of those so cured is considered the best, although the reputation of the Hampshire bacon depends chiefly on the skilful manner in which it is cured.

According to the Landowners' Return of 1872-73, the land was divided between 27,472 proprietors, holding land the gross annual value of which was £2,469,124. Of the owners 77 per cent. possessed less than one acre, and the average all over was £2, 10s. 2½d. There were no fewer than 35 proprietors holding upwards of 5000 acres, viz.:—Earl of Portsmouth, 16,401; Duke of Wellington, 15,847; Lord Ashburton, 15,330; Sir William Heathcote, Bart., 14,189; Lord Bolton, 13,808; Melville Portal, 10,566; Earl of Carnarvon, 9294; Lord Northbrook, 9236; Earl of Normanton, 9236; Lord Henry Scott, 8922; executors of John B. W. Fleming, 8843; Sir J. B. Simeon, 8724; Thomas Chamberlayne 8535; Thomas Thistlethwaite, 8084; Thomas Baring, 8058; Sir J. C. Jervoise, 7877; College of Winchester, 7269; Sir H. A. Tichborne, 7270; Sir Henry Mildmay, 6762; Crown Property, 6554; H. P. Delme, 6258; Rev. Thomas Best, 6184; F. J. E. Jervoise, 6188; W. W. B. Beach, 6099; Dean and Chapter of Westminster, 5837; W. F. Cowper-Temple, 5780; John Bonham Carter 5621; John Morant, 5596; W. H. Kingsmill, 5361; Lord Heytesbury, 5195; Edgar A. Drummond, 5155; W. H. S. Stanley, 5150; William H. Iremonger, 5103; Edward Knight, 5044; Lady Jane Mill, 5040.

Manufactures and Trade.—The manufactures are unimportant except those carried on at Portsmouth and Gosport in connexion with the royal navy. There are large steam docks and an extensive shipping trade at Southampton. In many of the towns there are breweries and tanneries, and paper is manufactured at several places. Fancy pottery and terra cotta are made at Fareham and Bishop's Walkham; and Ringwood is celebrated for its knitted gloves. At most of the coast towns fishing is prosecuted, and there are oyster beds at Hayling Island. Cowes in the Isle of Wight is the station of the royal yacht squadron and has building yards for yachts and large steamers. The principal bathing-places, besides those in the Isle of Wight, are Southsea, Southhayling, Bournemouth, and Anglesea, a suburb of Gosport. At Portsmouth there is a convict prison, at Parkhurst a prison for convict boys, and at Aldershot a large military camp.

Railways.—The London and South-Western Railway enters the county at Farnborough, passing by Winchester and from thence to Southampton, a branch diverging from Bishopstoke to Gosport, and again to Portsmouth, Havant, and Emsworth, via the South Coast Railway, by a branch from Fareham. A branch of the Great Western from Reading joins the South-Western at Basingstoke, about a mile south-west from which a line diverges to Whitchurch, Andover, and Salisbury. The Guildford and Reigate branch of the South Coast Railway communicates with Alton and New Alresford, 6 miles west of which it joins the South-Western. Southampton communicates with Dorchester by the Dorchester Railway which, after branching to Lyminster, passes Ringwood, from which there is another branch to Christchurch and Bournemouth. Another line connects Southampton with Salisbury, and from this line a branch 4 miles north of Romsey communicates with Andover.

Administration.—Hampshire, including the Isle of Wight, comprises 38 "hundreds," 10 "liberties," 1 city, that of Winchester (16,366), which is also a municipal and parliamentary borough; 5 other boroughs which are both municipal and parliamentary, viz., Andover (5744), Lyminster (5356), Newport (8522), Portsmouth (113,569), and Southampton (53,741); 2 parliamentary boroughs, viz., Christchurch (15,415) and Petersfield (6104); and 3 municipal boroughs—Basingstoke (5574), Romsey (2056), and Ryde (11,260).

For parliamentary purposes Haunts is formed into three divisions, viz., North Haunts, South Haunts, and the Isle of Wight. Winchester which returns 2 members, and Andover and Petersfield

which return 1 member each are in the northern division, which returns in all 6 members; in the southern division are included the boroughs of Christchurch and Lyminster returning 1 member each, and the boroughs of Portsmouth and Southampton returning 2 each, and it returns in all 8 members; the Isle of Wight returns 1 member, and also contains the borough of Newport returning 1 member. The total representation of the county is thus 16 members.

The county has one court of quarter sessions, and is divided into 14 petty sessional divisions. The city of Winchester, and the boroughs of Andover, Portsmouth, and Southampton (a county of itself), have commissioners of the peace and separate courts of quarter sessions; and the boroughs of Basingstoke, Newport, Romsey, and Ryde have commissions of the peace. In the borough of Lyminster the mayor and ex-mayor are magistrates, and the county justices have concurrent jurisdiction. The county is included in the western circuit, and ecclesiastically is almost entirely in the diocese of Winchester.

Population.—The total population of the county amounted in 1841 to 354,682, in 1851 to 405,370, in 1861 to 481,815, and in 1871 to 544,684 (males, 275,393; females, 269,291). The increase in 30 years from 1841 has been 54 per cent., and since 1801 it has been 97 per cent. The excess of males over females is accounted for by the naval and military establishments situated in the county. In 1871 the mainland portion contained a population of 478,465, and the Isle of Wight 66,219.

History and Antiquities.—Before the Roman invasion the Welsh Celts of Hampshire had been driven out or subdued by incursions of Gauls, who first took possession of the country round Winchester to the west of the great forest of Andreswald, stretching into Hampshire from Sussex, and gradually occupied the greater part of the southern shires from Surrey and Sussex to Devon. It was probably during this prolonged contest that the entrenched camps were formed at Beacon Hill, Bury Hill, Danebury, Quarley Mount, and Worldbury Mount. The Gauls whom the Romans found in South Britain were divided into three tribes—the *Regni* on the coast, the *Belgae* in the middle, and the *Atrebates* in the north. Their chief town occupied the site of the modern Winchester, and was known as *Venta Belgarum* by the Romans, who made it one of their principal stations. From it roads, traces of which may yet be seen, were constructed to Sorbiodunum (Old Sarum), Silchester, and Southampton, and to Porchester (Portsmouth) and Chichester. Next to *Venta Belgarum* the most important Roman station in Hampshire was *Calleva* (probably Silchester), where there are yet very extensive remains; traces of a large station (*Claesentum*) are still to be seen at Southampton; at Portsmouth portions of an old Roman fort are incorporated in the castle of Porchester; at Broughton, near Stockbridge, slight traces of a station are still visible; and an intrenchment at Egbury Hill, near Whitchurch, is regarded by some as the remains of the ancient *Vindomis*, although others place the site of that town at Silchester. Even before the Roman conquest of Britain the southern shores of England had been frequently attacked by Saxon pirates, and afterwards, in 475, the warriors Hengist and Horsa had succeeded ultimately and with great difficulty in establishing themselves in Kent; but the real conquest of southern Britain was accomplished by a Saxon tribe called *Gervissa* or *Gervissi*, who about the year 495, under Cerddig and his son Cynric, landed from five ships on the shores of Southampton Water, and concluded a stubborn contest by defeating the Britons at Charford in 519, from which period is generally dated the origin of the kingdom of Wessex, which had for its capital Winchester, then known as Wintanceaster or Wintecceaster. The establishment of the bishop's see at Winchester, after the conversion of King Kynegils of Wessex about 635, falls more appropriately to be noticed in the article on that city. In 755, according to the Saxon chronicle, Sigebert, king of Wessex, was deprived by the witan of the whole of his kingdom, with the exception of *Hamtanscive*, the first time that the name occurs. Hampshire played a prominent part in the contest with the Danes or Northmen, who about 860 stormed Winchester, but were afterwards worsted, in 871 defeated Ethelbert at Basing, and in 878 compelled King Alfred to retreat to the woods and fastnesses. The devastation of the Isle of Wight by the Danes in the reign of Ethelred II., and the other historical events connected with that island, will be noticed in the article WIGHT, ISLE OF. Under Edward the Confessor and Harold II. the seat of government had been transferred from Winchester to Westminster, but the honour was again restored to Hampshire by William the Conqueror, who made Winchester his principal residence, and for the purposes of sport devastated a large part of the county to form the New Forest. The superstitious fancies of the time traced a necessary connexion between this violent exercise of his prerogatives and the sudden death of his sons and grandson within the boundaries of the scene of his ruthless devastations: his son Richard was smitten with sudden death in the New Forest while hunting; a second Richard, a natural son of Robert his eldest son, met his death there accidentally; and William Rufus, his eldest son and his successor, while hunting within it was shot by an arrow in 1100. The loss which the shire

sustained by the final transference of the seat of government to London was partially compensated for by the rise of the ports of Southampton and Portsmouth, which have been an important element in its prosperity down to the present time. The principal other historical events of the shire are connected either with these two towns or with Winchester or the Isle of Wight, the only exception of importance being the siege and capture of Basing House by the troops of Cromwell in 1645.

The principal monastic institutions in Hampshire, dissolved by Henry VIII., were the priory of St Swithin, who was bishop of Winchester from 852 to 862; the monastery of Hyde, outside the walls of Winchester, founded by King Alfred; the nunnery of St Mary's, Winchester; St Elizabeth's College, Winchester; the nunnery of Wherwell, founded by Elfrida; the Augustinian priory of Southwick, founded by William of Wykeham; the Præmonstratensian abbey of Tichfield, founded in the time of Henry III.; the Augustinian priory of Twyneham, Christchurch, founded according to some authorities by King Athelstan; the Augustinian priory of Breamore, founded by Baldwin de Redvers; the nunnery of Romsey, founded by Edward the Elder about 910; the Augustinian priory of Mottisfont, endowed soon after the Conquest, but by whom is uncertain; the Cistercian abbey of Beaulieu, founded by King John about 1204; the Cistercian abbey of Netley, founded in the time of Henry III.; the Augustinian priory of St Denis, near Southampton, founded by Henry I.; the abbey of Quarr, Isle of Wight; and the preceptory of Baddesley. The most important monastic remains are those at Winchester; the priory church at Christchurch in the Norman and Perpendicular style; the Norman church at Romsey; the remains of Netley Abbey, with a church in the Early English style; the ruins of Beaulieu Abbey, of which a gateway is in good preservation (the abbot's house has been converted into a private residence, and the great hall or refectory, in the plain Early English style, is now used as a parish church); the ruins of the priory of St Denis, and the Norman church at Porchester, near Portsmouth. Corhampton church, near Exton, is the only Saxon church in Hampshire which is entire, but Saxon masonry is found in Headbourne Worthy church, which also contains an old brass of the 15th century. The principal other old churches not mentioned under Winchester, Southampton, and other towns, nor already referred to in connexion with monastic remains, are—in the Norman style, Chilcombe, Hamble, Kingsclere, and Tichbourne; in the Norman style, with Early English additions, Alton, Basing, Bishop's Sutton, Brockenhurst, Clatford, Hambleton, Milford, and Warnford; in the Early English, Boldre, Cheriton, Grately, Sopley, which is partly Perpendicular, and Thruxton, which contains a brass to Sir John Lisle (died 1407), affording the earliest example of complete plate armour in England; and in the Perpendicular, Basingstoke, Fordingbridge, which is also partly Decorated, Tichfield, Selborne, and Warblington.

The principal old castles are Calshot Castle, built in the time of Henry VIII., and used by the coast-guard; Carisbrook Castle (see WIGHT, ISLE OF); Hurst Castle, near Southampton, where Charles I. was for a short time imprisoned, now transformed into a fortress; and Porchester Castle (see PORTSMOUTH). The modern residences of the gentry are more than usually numerous.

Among the eminent persons connected with Hampshire may be mentioned Young, author of the *Night Thoughts*; Warton, author of the *History of English Poetry*; Dibdin, Bishop Wykeham, Pecoche the traveller, Sir William Petty, Jonas Hanway, Brunel, Gilbert White, John Keble, and Charles Dickens.

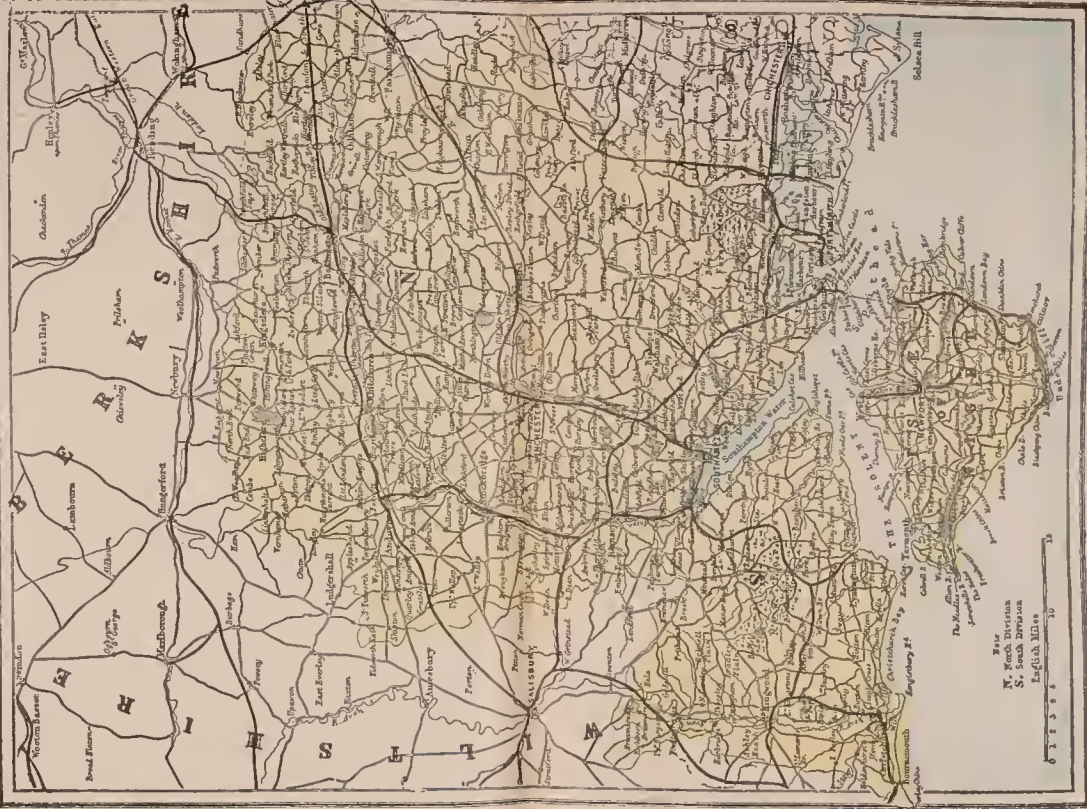

See the papers regarding the early history of South Britain by Dr Guest in the *Archæological Journal*, and in the *Transactions of the Archæological Institute*; *Hampshire, extracted from Domesday Book*, by Richard Warner, 1789; Moody, *Hampshire in 1086* (1862), and the same author's *Antiquarian and Topographical Sketches*, 1846, and *Notes and Essays relating to the Counties of Hants and Wilts*, 1851; R. Mudie, *History of Hampshire*, 2 vols., 1840; J. Duthie, *Sketches of Hampshire*, 1840; P. J. Martin, *Geology of Hampshire*, 1851; *Michaelmarsh and its Antiquities*, 1867; Woodward's important *History of Hampshire*, 3 vols., 1869; and White's *History and Directory of Hampshire and the Isle of Wight*, 1879.

HAMPSTEAD, a suburb of London, is situated in the county of Middlesex, on the slope of Hampstead Hill, 4 miles N.W. of the city. The village is irregularly built, and the streets are narrow and tortuous, but it has preserved more than any other London suburb its sylvan appearance, and is still noted for its fine groves and avenues. From the side of the hill there issue chalybeate springs, whose virtue was first discovered in the 17th century, and which at the beginning of last century rivalled those of Tunbridge Wells and Epsom in popularity. Their reputation, however, gradually declined after the middle of the century, and now the

supply of mineral water has been greatly diminished by the cutting of deep drains and of railway tunnels. Hampstead Heath, an irregular sandy tract occupying the summit and northern slope of the hill, and extending to 240 acres, is much frequented by excursionists and picnic parties. The hill is the highest in the vicinity of the metropolis, being 443 feet above the level of the Thames, or 36 feet higher than the cross of St Paul's. At one time the village was a favourite resort of poets and other men of letters; and among the more famous of its old taverns was the Flask Inn, now converted into a private residence, the meeting-place of the Kit-Cat club, of which the more celebrated members were Addison, Steele, Richardson, Marlborough, and Walpole. The parish church of St John, consecrated in 1747 and enlarged in 1844, is a plain brick structure in the Italian style with a picturesque tower. The graveyard contains a number of monuments of eminent persons, including those of Sir James Mackintosh, Joanna Baillie, and Constable the artist. Near the village a large militia barracks was erected in 1863, and there are a number of charitable institutions, including a soldiers' daughters' home, a sailors' daughters' home, an orphan working school, and the North London Consumptive Hospital. The population of the parish in 1871 was 32,281.

HAMPTON, a village in the county of Middlesex, England, is situated on the north bank of the Thames, 12 miles W.S.W. from Hyde Park Corner. The parish church erected in 1830, with a square tower at its western end, is without architectural merit, but the churchyard contains a number of interesting old monuments. Among the many fine residences in the vicinity is Garrick Villa, formerly, under the name of Hampton House, the residence of Garrick the famous actor. In the neighbourhood there are a number of large pumping works for supplying London with water. The free grammar school founded in 1556 was reopened in 1878 as a middle-class school, for which the usual fees are charged. The population of the village in 1871 was 2207.

About a mile from Hampton village and close to the river stands Hampton Court Palace, one of the finest extant specimens of the Tudor style of architecture, and formerly a royal residence. It was originally erected by Cardinal Wolsey, who in 1515 received a lease of the old mansion and grounds for 99 years. As the splendour of the building seemed to awaken the cupidity of Henry VIII., Wolsey in 1526 thought it prudent to make him a present of it. It became Henry's favourite residence, and he made several additions to the building, including the great hall and chapel in the Gothic style. Of the original five quadrangles only two now remain, but a third was erected by Sir Christopher Wren for William III. The fine gardens, extending to 44 acres, were laid out at the desire of William III. in the Dutch style, with elevated terraces, long shady walks, and a labyrinth called the "Maze," which is the source of great amusement to visitors. Bushy Park, opposite the palace gardens, is open to the public, and contains a celebrated avenue of chestnut trees. The palace was sold by the parliament in 1641, but afterwards came into the hands of Cromwell; and it continued to be one of the principal residences of the English sovereigns until the time of George II. It was the birthplace of Edward VI., and the meeting-place of the conference held in the reign of James I. to settle the dispute between the Presbyterians and the state clergy. It is now partly occupied by persons of rank in reduced circumstances; but its state apartments, picture gallery, and gardens are open to the public free of charge. The celebrated cartoons of Raphael which it formerly possessed have lately been removed to the South Kensington

Museum, but it still contains a valuable collection of pictures, including a number of fine specimens of the old masters, and a large collection of portraits of persons famous in English history.

HAMSTER (*Cricetus*), a genus of rodent mammals belonging to the *Muridæ* or mice family, and characterized by the possession of large cheek pouches. The common hamster (*Cricetus vulgaris*) is somewhat larger and stouter than the Norway rat, but with a much shorter tail. Its fur, which varies somewhat in colour, is generally of a reddish-brown above and black beneath, with several white spots on the sides. It is found throughout the dry regions of central Europe and Asia, from the Rhine eastward to the river Obi and southward to Persia and the Caucasus. It is a burrowing animal, its subterranean dwelling consisting of several vaults, most of which are storehouses for the grain and seeds which the hamster lays up in autumn for consumption during winter and spring. In collecting this store it makes use of its cheek pouches, which are said to be large enough to contain a quarter of an English pint, while the hoard of a single individual will sometimes contain about two bushels of grain. It is thus specially obnoxious to the farmer, who loses no opportunity of destroying the creature and of ransacking its stores. Like many other rodents, the hamster is exceedingly prolific, the female producing several broods in the year, each consisting of over a dozen young, and these when not more than three weeks old are turned out of the parental burrow to form underground homes for themselves. The burrow of the young hamster is only about a foot in depth, while that of the adult descends 4 or 5 feet beneath the surface. On the approach of winter the hamster retires to its subterranean abode, the various entrances to which it carefully closes, and there it remains until the advent of milder conditions, feeding for a while on its well-garnered store, but becoming torpid during the coldest period of winter. Although feeding chiefly on roots, fruits, and grain, it is also to some extent carnivorous, attacking and feeding upon small quadrupeds, lizards, and birds. It is exceedingly fierce and pugnacious, the males especially fighting with each other for possession of the females. The numbers of those destructive vermin are kept in check by their many natural enemies, the foxes, dogs, cats, and polecats, which feed upon them. The skin of the hamster is of some value, and its flesh is used as food. Its burrows are sought after in the countries where it abounds, both for capturing the animal and for rifling its store.

HANAU, a town of Prussia, capital of a circle in the government district of Cassel, province of Hesse-Nassau, is situated at the confluence of the rivers Kinzig and Main, 12 miles E. of Frankfort. It consists of what are called an old and a new town. The streets of the former are narrow and irregular, but the latter, founded at the end of the 16th century by refugee Walloons and Netherlanders, is built in the form of a pentagon with broad streets crossing at right angles, and possesses several fine squares, among which may be mentioned the market-place, adorned with handsome fountains at the four corners. The town is the seat of a circle court, a head tax-office, a chamber of commerce, and a branch of the imperial bank. Among the principal buildings are the ancient castle, formerly the residence of the counts of Hanau; the church of St John, dating from the 17th century, with a rather imposing tower; the old church of St Mary, formerly a collegiate church, and containing the tomb of the counts of Hanau; the church of the new town, built in the beginning of the 17th century, whose ground plan is in the form of two circles intersecting each other; the beautiful new Catholic church, the synagogue, the theatre, the barracks, the arsenal, the orphanage, and the infirmary. Its educational establishments include a

gymnasium, a school of design, a real-school, and a higher girls' school. There is a Wetteravian society of natural history and an historical society, both of which possess considerable libraries and collections connected with their respective branches of knowledge. Hanau is the birthplace of the brothers Grimm, and the house in which they were born is now adorned with a medallion. In the neighbourhood of the town are the electoral palace, with an extensive park and large orangeries, and the watering-place of Wilhelmsbad. Hanau is the principal commercial and manufacturing town in the province, and stands next to Cassel in point of population. Its staples are ornaments of various kinds, cigars, leather, paper, playing cards, silver and platina wares, chocolate, soap, woollen cloth, hats, silk, gloves, stockings, ropes, and matches. It has also three large foundries and a number of breweries, and in the neighbourhood there are extensive powder-mills. It carries on a large trade in wood, wine, and corn, in addition to its articles of manufacture. The population of the town in 1875 was 22,269.

From the number of urns, coins, and other antiquities found near Hanau it would appear that it owes its origin to a Roman settlement. It was raised to the rank of a town in 1393, and in 1523 it was fortified by Count Philip, who rebuilt the castle. At the end of the 16th century its prosperity received considerable impulse from the accession of the Walloons and Netherlanders. During the Thirty Years' War it was in 1631 taken by the Swedes, and in 1636 it was besieged by the imperial troops, but was relieved on the 13th June by Landgrave William V. of Cassel, on account of which the day is still commemorated by the inhabitants. Napoleon on his retreat from Leipsic defeated the Germans under Marshal Wrede at Hanau, October 30, 1813; and on the following day the allies vacated the town, when it was entered by the French. In 1429 Hanau became the capital of a province of the empire, which on the death of Count Reinhard II. was in 1451 partitioned between the Hanau-Münzenberg and Hanau-Lichtenberg lines, but was reunited in 1692 when the elder line became extinct. The younger line received princely rank in 1696, but, as it also became extinct, Hanau-Münzenberg in 1756 was joined to Hesse-Cassel and Hanau-Lichtenberg to Hesse-Darmstadt. In 1785 the whole province was united to Hesse-Cassel, and in 1803 it became an independent principality. In 1813 it again came into the possession of Hesse-Cassel, and in 1866 it was joined to Prussia.

HANCOCK, JOHN (1737-1793), American revolutionary statesman, was born at Quincy, Massachusetts, January 12, 1737. Having taken his degree at Harvard university in 1754, he began a mercantile career, and on the death of an uncle in 1764 succeeded to a large fortune and a prosperous business. In 1768, two years after his election to the Massachusetts house of representatives by the city of Boston, his sloop "Liberty" was seized for contravention of the commercial laws, and in the riot which followed the royal customs commissioners barely escaped with their lives. After the "massacre" of Boston in 1770, Hancock inveighed with such spirit and bitterness against the troops and their officers, demanding their removal from the town, that he became obnoxious to the Government; and five years afterwards the attempt to seize his person led to the first revolutionary battle at Concord, Massachusetts. In 1774 Hancock was president of the provincial congress, and from 1775 to 1777 of the general congress at Philadelphia, where he was the first to sign the declaration of independence. Returning to Massachusetts he assisted in framing its constitution, and in 1780 was chosen first governor. He was annually elected to this dignity till 1785, and again from 1787 to 1793, sitting as an ordinary member of the legislature in the interval. He received the degree of LL.D. from Harvard university in 1792. He died at Quincy, 8th October 1793.

HANDEL, GEORGE FREDERICK (1685-1759), one of the greatest names in the history of music generally, is absolutely paramount in that of English music. His influence on the artistic development of England and his popularity, using that word in the most comprehensive sense, are

perhaps unequalled. He has entered into the private and the political life as well as into the art life of Englishmen; without him they cannot bury their dead or elect their legislators; and never has a composer been more essentially national than the German Handel has become in England. It may on the other hand be said that but for his sojourn in that country Handel would never have been what he was. It was under the influence of English poetry, and of English national and religious life, that his artistic conception broadened and gained the dignity and grandeur which we see in his oratorios, and which was wanting, and, seeing the style of art, could not but be wanting, in his Italian operas. The day of Handel's arrival in London, late in the autumn of 1710, was indeed an eventful day in the life of Handel as well as in the annals of English music, and the facts of his biography preceding that date may be summed up with comparative brevity. George Frederick Handel (in German the name is always Händel) was born at Halle in Saxony on February 23, 1685, the same year which gave birth to his great fellow composer Johann Sebastian Bach.¹ He was the son of George Handel, who according to the custom of the time combined the occupations of barber and surgeon, and subsequently rose to be valet-de-chambre to the elector of Saxony. His second wife, Dorothea Taust, was the daughter of a clergyman, and to her the great composer remained attached with all the ties of filial affection. His father was sixty-three years old when Handel was born, and the musical talent shown by the youth at a very early age found little encouragement from the stern old gentleman, who looked upon art with contempt, and destined his son for the law. Many are the anecdotes relating to the surreptitious way in which the youth practised the forbidden art on a little spinet smuggled into his attic by the aid of a good-natured aunt, and fortunately of too feeble tone to be audible in the lower part of the house. At the age of eight the boy accompanied his father on a visit to Saxe-Weissenfels, and it was there that the proficiency acquired in the manner above described was turned to excellent account; for, having made acquaintance with the court musicians, and being allowed to practise on the organ, he was on one occasion overheard by the duke himself, who immediately recognizing his talent spoke seriously to the father on his behalf. To such a remonstrance coming from such a quarter the valet-de-chambre had of course to submit, and henceforth Handel was allowed to practise his art, and after his return to Halle even received musical instruction from Zachau, one of the best organists of the town. It was under his somewhat mechanical but thorough tuition that Handel acquired his knowledge of counterpoint; he also soon became an excellent performer on the organ. His first attempts at composition date from an equally early period, and in his twelfth year he made his début as a virtuoso at the court of Berlin with such success that the elector of Brandenburg, afterwards King Frederick I. of Prussia, offered to send him to Italy, a proposal declined by Handel's father for unknown reasons. In 1697 the latter died, and the young artist was henceforth thrown on his own resources. For some years he remained in Halle, where in 1702 he obtained a position as organist; but in the following year we find him at Hamburg, at that time one of the musical centres of Germany. There the only German opera worth the name had been founded by Reinhold Keiser, the author of innumerable operas and operettas, and was flourishing at the time under his direction. Handel entered the orchestra, and soon rose from his place amongst the second violins to the conductor's seat at the clavicembalo, which he occupied during Keiser's

¹ The date, 23d February 1684, given on his tombstone in Westminster Abbey is incorrect.

absence, necessitated by debt. It was at Hamburg that he became acquainted with Mattheson, a fertile composer and writer on musical subjects, whose *Vollkommener Kapellmeister* (1739) and *Ehrenpforte* (1740) are valuable sources for the history of music. The friendship of the two young men was not without some curious incidents. On one occasion they set out together on a journey to Lübeck, where the place of organist at one of the churches was vacant. Arrived at Lübeck, they discovered that one of the conditions for obtaining the place was the hand of the elderly daughter of the former organist, the celebrated Buxtehude, whereat the two candidates forthwith returned to Hamburg. Another adventure might have had still more serious consequences. At a performance of Mattheson's opera *Cleopatra* at Hamburg, Handel refused to give up the conductor's seat to the composer, who was also a singer, and was occupied on the stage during the early part of his work. The dispute led to an improvised duel outside the theatre, and but for a large button on Handel's coat which intercepted his adversary's sword, there would have been no *Messiah* or *Israel in Egypt*. In spite of all this the young men remained friends, and Mattheson's writings are full of the most valuable facts for Handel's biography. He relates in his *Ehrenpforte* amongst other things that his friend at that time used to compose "interminable cantatas" of no great merit, but of these no trace now remains, unless we assume that a "Passion" according to St John (German words by Postel), the MS. of which is at the Royal Library, Berlin, is amongst the works alluded to. It was composed in 1704. The year after this witnessed Handel's first dramatic attempt—a German opera, *Almira*, performed at Hamburg on January 8, 1705, with great success, and followed a few weeks later by another work of the same class, *Nero* by name. In 1706 he left Hamburg for Italy, at that time still the great school of music, to which indeed Handel himself owed his skill and experience in writing for the voice. He remained in Italy for three years, living at various times in Florence, Rome, Naples, and Venice. He is said to have made the acquaintance of Letti, of Alessandro Scarlatti, and of the latter's son Domenico, the father of modern pianoforte playing. His compositions during his Italian period were two operas, two oratorios, *Resurrezione* and *Il Trionfo del Tempo e del Disinganno*, afterwards developed into the English oratorio *The Triumph of Time and Truth*, and numerous other choral works. It was during these years that the composer's earlier or Italian style reached its full maturity, and that his name became widely known in the musical world. In the chief cities of Italy "il Sassone," as Handel, like his countryman Hasse twenty years later, was nicknamed, was received with every mark of favour and esteem. But his own country also began to acknowledge his merits. At Venice in 1709 Handel received the offer of the post of capellmeister to the elector of Hanover, transmitted to him by his patron and staunch friend of later years Baron Kielmansegge. The composer at the time contemplated a visit to England, and he accepted the offer only on condition of leave of absence being granted to him for that purpose. To England accordingly Handel journeyed after a short stay at Hanover, arriving in London towards the close of 1710. Curiously enough he came as a composer of Italian opera, and in that capacity he earned his first success at the Haymarket with the opera *Rinaldo*, composed it is said in a fortnight, and first performed on February 24, 1711. The beautiful and still universally popular air "Lascia ch'io pianga" is from this opera. A similar air in the form of a *sarabande* occurs in *Almira*. After the close of the season in June of the same year Handel seems to have returned to Germany for a short time: but the temptation of English fame or English gold

proved too powerful, and in January 1712 we find him back in London, evidently little inclined to return to Hanover in spite of his duties at the court there. Two Italian operas, the celebrated Utrecht *Te Deum* written by command of Queen Anne, and other works belong to this period. It was in such circumstances somewhat awkward for the composer when his deserted master came to London as George I. of England. Neither was the king slow in resenting the wrongs of the elector. For a considerable time Handel was not allowed to appear at court, and it was only through the intercession of his patron Baron Kielmansegge that his pardon was at last obtained. Commissioned by the latter, Handel wrote his celebrated *Water-Music*, which was performed at a great fête on the Thames, and so pleased the king that he at once received the composer to his good graces. A salary of £200 a year granted to Handel was the immediate result of this happy consummation. In 1716 he followed the king to Germany, where he wrote a second German "Passion," the words this time being supplied by Brockes, a well-known poet of the day. After his return to England he entered the service of the duke of Chandos as conductor of his private concerts. In this capacity he resided for three years at Cannons, the duke's splendid seat near Edgware, and produced the two *Te Deums* and the twelve Anthems surnamed *Chandos*. The English pastoral *Acis and Galatea* (not to be mistaken for the Italian cantata of that name written at Naples, with which it has nothing in common), and his first oratorio to English words *Esther*, were written during his stay at Cannons. It was not till 1720 that he appeared again in a public capacity, viz., in that of impresario of an Italian opera at the Haymarket Theatre, which he managed for the so-called Royal Academy of Music. Senesino, a celebrated singer, to engage whom the composer specially journeyed to Dresden, was the mainstay of the enterprise, which opened with a highly successful performance of Handel's opera *Radamisto*. *Muzio Scevola*, written in conjunction with Buononcini and Ariosti, *Tamerlane*, *Rodelinda*, and other operas composed for the same theatre, are now forgotten, only detached songs being heard at concerts. To this time also belongs the celebrated rivalry of Handel and Buononcini, a gifted Italian composer, who by his clique was declared to be infinitely superior to the German master. The controversy raised a storm in the aristocratic teapots, and has been perpetuated in the lines generally but erroneously attributed to Swift, and in reality written by John Byrom:—

Some say, compared to Buononcini,
That Mynheer Handel's but a ninny;
Others aver that he to Handel
Is scarcely fit to hold a candle.
Strange all this difference should be
'Twixt Tweedle-dum and Tweedle-dee.

Although the contempt for music, worthy of Chesterfield himself, shown in these lines may seem absurd, they yet contain a grain of truth. Handel differed from his rival only in degree not in essence. In other words, he was an infinitely greater composer than Buononcini, but had he continued to write Italian opera there is no reason to conclude from his existing works of that class that he would have reformed or in any essential point modified the existing *genre*. The contest was therefore essentially of a personal nature, and in these circumstances it is hardly necessary to add that Handel remained victorious. Buononcini for a reason not sufficiently explained left London, and Handel was left without a rival. But in spite of this his connexion with Italian opera was not to be a source of pleasure or of wealth to the great composer. For twenty years the indomitable master was engaged in various operatic ventures, in spite of a rival company under the great singer Farinelli, started

by his enemies,—in spite also of his bankruptcy in 1737, and an attack of paralysis caused by anxiety and overwork. Of the numerous operas produced by him during this period it would be needless to speak in detail. Only the name of the final work of the long series, *Deidamia*, produced in 1741, may be mentioned here. That Handel's non-success was not caused by the inferiority of his works to those of other composers is sufficiently proved by the fact that the rival company also had to be dissolved for want of support. But Handel was in more than one way disqualified for the post of operatic manager, dependent in those days even more than in ours on the patronage of the great. To submit to the whims and the pride of the aristocracy was not in the nature of the upright German, who even at the concerts of the princess of Wales would use language not often heard at courts when the talking of the ladies during the performance irritated him. And, what was perhaps still more fatal, he opposed with equal firmness the caprices and inartistic tendencies of those absolute rulers of the Italian stage—the singers. The story is told that he took hold of an obstinate *prima donna* and held her at arm's length out of window, threatening to drop her into the street below unless she would sing a particular passage in the proper way. Such arguments were irresistible at the time, but their final results were equally obvious, in spite of Handel's essentially kindly nature and the ready assistance he gave to those who really wished to learn. No wonder therefore that his quarrels with virtuosi were numerous, and that Senesino deserted him at a critical moment for the enemy's camp.

It is a question whether Handel's change from opera to oratorio has been altogether in the interest of musical art. The opera lost in him a great power, but it may well be doubted whether dramatic music such as it was in those days would have been a proper mould for his genius. Neither is it certain that that genius was, strictly speaking, of a dramatic cast. There are no doubt in his oratorios—for in these alone Handel's power is displayed in its maturity—examples of great dramatic force of expression; but Handel's genius was in want of greater expansion than the economy of the drama will allow of. It was no doubt for this reason that from an inner necessity he created for himself the form of the oratorio, which in spite of the dialogue in which the plot is developed is in all essentials the musical equivalent of the epic. This breadth and depth of the epic is recognized in those marvellous choral pieces expressive either of pictorial detail (as the gnats and the darkness tangible and impenetrable in *Israel in Egypt*) or of the combined religious feeling of an entire nation. By the side of these even the finest solo pieces of Handel's scores appear comparatively insignificant, and we cannot sufficiently wonder at the obtuseness of the public which demanded the insertion of miscellaneous operatic arias as a relief from the incessant choruses in *Israel in Egypt* at the second performance of that great work in 1740. Handel is less the exponent of individual passion than the interpreter of the sufferings and aspirations of a nation, or in a wider sense of mankind. Take, for instance, the celebrated *Dead March in Saul*. It is full of intense grief, in spite of the key of C major, which ought once for all to dispel the prejudice that sorrow always speaks in minor keys. Even Chopin himself has not been able to give utterance to the feeling in more impressive strains. And yet the measured and decisive rhythm, and the simple diatonic harmonies, plainly indicate that here a mighty nation deploras the death of a hero. It is for the same reason that Handel's stay in England was of such great influence on his artistic career. Generally speaking, there is little connexion between politics and art. But it may be said without exaggeration that only amongst a free people, and a people having a national

life such as England alone had in the last century, such national epics as *Judas Maccabeus* and *Israel in Egypt* could have been engendered. In the same sense the *Messiah* became the embodiment of the deep religious feeling pervading the English people, and Handel, by leaving Italian opera for the oratorio, was changed from the entertainer of a caste to the artist of the people in the highest and widest sense. The *Messiah* is indeed the musical equivalent of Milton's *Paradise Lost*. This leads us to another and equally important aspect of the same subject—the important influence of English poetry on Handel's works. Not only are some of the greatest names of English literature—Milton (*Allegro and Penseroso*), Dryden (*Alexander's Feast*), Pope (*St Cecilia's Ode*)—immediately connected with Handel's compositions, but the spirit of these poets, and especially of Milton, pervades his oratorios even when he has to deal with the atrocious doggerel of Morell or Humphreys. In addition to this Handel received many a valuable suggestion from the works of Purcell and other early English musicians with which he was well acquainted. No wonder therefore that Englishmen claim Handel as one of themselves, and have granted him honours both during his lifetime and after his death such as have fallen to the share of few artists. But in spite of all this it is impossible to deny that the chances of a national development of English music were, if not absolutely crushed, at least delayed for centuries by Handel. Under Elizabeth and James England had a school of music which, after the storms of the civil war, was once more revived by such masters as Pelham Humphrey and his great pupil Purcell. The latter, although cut off in his youth, had left sufficient seed for a truly national growth of English music. But Handel soon concentrated the interest of connoisseurs and people on his own work, and native talent had to abandon the larger sphere of the metropolis for the comparative seclusion of the cathedral. The following is a chronological list of Handel's English oratorios taken from the catalogue of his works appended to Mr J. Marshall's article in *Crove's Dictionary of Music and Musicians*, vol. i. p. 657. *Esther* (1720), *Deborah* (1733), *Athalie* (1733), *Saul* (1738), *Israel in Egypt* (1738), *Messiah* (1741), *Samson* (1741), *Joseph* (1743), *Hercules* (1744), *Belshazzar* (1744), *Occasional* (1746), *Judas Maccabeus* (1746), *Alexander Balas* (1747), *Joshua* (1747), *Solomon* (1748), *Susanna* (1748), *Theodora* (1749), *Jephtha* (1751), *Triumph of Time and Truth* (1757). The sequence of these dates will show that the transition from Italian opera to sacred music was very gradual, and caused by circumstances rather than by premeditated choice. It would lead us too far to enter here into the genesis of each of these works, but a few remarks must be added with regard to Handel's *summum opus* the *Messiah*. It was written in twenty-four days and first performed April 18, 1742, at Dublin, where Handel was staying on a visit to the duke of Devonshire, lord-lieutenant of Ireland. Its first performance in London took place on March 23d of the following year. Its introduction into Handel's native country was due to Philip Emanuel Bach, the son of the great Bach, who conducted it at Hamburg. At Berlin it was for the first time given in April 1786, under the leadership of Adam Hiller, who also introduced it a few months later at Leipsic against the advice of all the musicians of Saxony. At the Berlin performance Signora Carrara, the celebrated singer, inserted in the first part an aria by Traetta, in which, according to a contemporary account, "she took much trouble to please the public, and the bravura passages of which she delivered with great success." Two years before this had taken place the great Handel commemoration at Westminster Abbey, when on the third day of the festival, May 29, 1784, the *Messiah* was splendidly performed by an orchestra and chorus of 525

performers. In the appreciation of Handel England thus was far in advance of Germany. The remainder of Handel's life may be told in few words. Owing to the machinations of his enemies he for a second time became a bankrupt in 1745, but nothing, not even his blindness during the last six years of his life, could daunt his energy. He worked till the last, and attended a performance of his *Messiah* a week before his death, which took place on April 14, 1759. He was buried in Westminster Abbey. His monument is by Roubilliac, the same sculptor who modelled the statue erected during Handel's lifetime in Vauxhall Gardens.

Handel was a man of character and high intelligence, and his interest was not, like that of too many musicians, confined to his own art exclusively. He liked the society of politicians and literary men, and he was also a collector of pictures and articles of vertu. His power of work was enormous, and the list of his works would fill many pages. They belong to all branches of music, from the simple air to the opera and oratorio. His most important works of the two last-named classes have already been mentioned. But his instrumental compositions, especially his concerti for the organ and his *suites de pièces* for the harpsichord, ought not to be forgotten. Amongst the contrapuntists of his time Handel had but one equal—Bach. But he also was a master of the orchestra, and, what is more, possessed the rare gift of genuine melody, unfortunately too often impeded by the rococo embellishments of his arias. The extraordinary rapidity with which he worked has been already referred to. It is true that when his own ideas failed him he helped himself to those of others without the slightest compunction. The system of wholesale plagiarism carried on by him is perhaps unprecedented in the history of music. He pilfered not only single melodies, but frequently entire movements from the works of other masters, with few or no alterations and without a word of acknowledgment.

A splendid collection of Handel's MSS., six volumes in all, is in the possession of her Majesty at Buckingham Palace. The Fitzwilliam Museum at Cambridge also possesses seven volumes, mostly sketches and notes for greater works, in the composer's handwriting. The German and English Handel Societies (the latter founded in 1843 and dissolved in 1848) have issued critical editions of his more important works. Three biographers of Handel deserve mention—an Englishman, Mainwaring, *Memoirs of the Life of the late G. F. Handel* (1760), a Frenchman, M. Victor Schœlcher, and a German, Herr Chrjrsander. (F. H.)

HAND TOOLS. Within the limits of the present article it would be impossible to describe even the majority of the instruments which may come under this designation, including as it does (in its popular if not in its technical sense) the whole of the appliances used by the handicraftsman in the treatment, by means of his muscular energy, of the natural substances used in the arts and manufactures, —whether in the preliminary operations of setting-out and measuring his materials, in reducing his work to the required form by cutting tools or otherwise, in gauging it and testing its accuracy, or in duly securing it whilst being thus treated. Omitting therefore the large but by no means unimportant class of measuring and gauging instruments, straight edges, templates, &c., we will confine our attention to examples of those in the use of which an actual expenditure of force is necessary. According to the structure and other properties of the materials to be treated by them, these act almost without exception either by impact, by pressure, or by cutting, the last being effected sometimes with impact and sometimes with pressure. The principal tools acting purely by impact are noticed under **HAMMER** (*q. v.*). Those which depend solely on pressure are for the most part of an auxiliary character only, and their consideration will be deferred till we have glanced at a few of the much more numerous and more important class known as cutting or edge tools.

It should be observed that the term "cutting" is applied to processes which have but little in common, the great differences of structure in the materials operated upon demanding equally great differences in the modes of effecting the desired end, which is in almost all cases the forcible separation of their particles in some regular and definite manner. If we regard, for example, the action of a sharp knife upon a piece of chalk as one of true cutting,—i.e., the separation of its particles by the forcible insertion of a wedge-like blade of superior hardness to itself,—we shall find that in by far the larger proportion of instances this simple action is rendered complicated, either through the substance under treatment being insufficiently compact to afford in itself the necessary resistance, or through its want of homogeneity causing a tendency in it to part more readily in some directions than in others. Thus all kinds of wood and the generality of both vegetable and animal substances, being cellular or fibrous in their structure, offer so much less resistance in a direction parallel to their fibres than in one transverse to them that in the former case many of them may be parted by fissure without any true cutting at all. So also with crystalline materials—as is beautifully exemplified by the diamond, which lends itself to cleavage in certain planes in the most perfect manner, though the steel chisel which is employed for the process is very much inferior in hardness to itself. Metals also are frequently not homogeneous; indeed they are sometimes said to be fibrous in structure, but it is only to a very limited extent, if at all, that they are so, and their great natural tenacity even then prevents the separation of their particles except by a true cutting process. Lastly, some stones and minerals, such as sandstones, are said to be cut, though they are formed of material considerably harder than the tools which are used upon them, the fact being that their hard particles are not cut at all, but are merely separated from one another when the cementing material which holds them together is compelled to give way.

I. Cutting or Edge Tools.—These, the term "cutting" being thus qualified, are mainly of two classes—(i.) cutting tools used with impact, and (ii.) cutting tools used mainly with pressure. These again may be subdivided into tools used (1) for wood and soft materials, (2) for metal, and (3) for stone and hard substances.

I. 1.—Wood-tools cutting by impact comprise all the varieties of axes and adzes, such as the ordinary English pattern of carpenter's

FIG. 1.—Axes.

axe (a, fig. 1), the woodman's felling axe (b), the wedge axe (c) (which was one of the first American improvements in edge tools introduced into Europe), and the shipwright's adze (d), which last

FIG. 2.—Chisels.

is a particularly rapid and efficient tool in skilful hands. All these when used in the direction of the grain of the wood act by cleaving rather than by cutting, except when the thickness of the chip

removed is so small that its transverse strength is inferior to the lateral tenacity of the fibres. So also do chisels and gouges when driven by blows from a hammer or mallet. The ordinary mortice chisel (c, fig. 2) and the socket chisel (f) are specially adapted for being used in this way.

2. In the case of metals their hardness in general almost precludes the possibility of employing upon them any tools corresponding to the above. If we except a few special tools such as plumbers' knives, &c., chisels will be found to be almost the sole representatives of this class. A blacksmith's chisel (g) held in a hazel withe, and used for hot iron, and some common forms of chisel for chipping it cold are shown in fig. 2, these being known as a chipping chisel (k), a cross-cut (j), a diamond point (l), and a round-nose (i).

3. Tools of this class for stone also consist chiefly of chisels, the mason's chisel (m) varying greatly in width of edge according to the variety of stone and the depth of the cut to be taken. Frequently they are brought quite to a point like the mason's pick, when they cease to be cutting tools from our point of view. The jumper (n), employed for rock drilling, with which the hole is produced by means of successive cuts radiating in all directions from its centre, which are delivered with the impact due either to its own weight or to the blows of a hammer on its outer end, is also a form of chisel.

ii. **Edge tools operating by pressure.**—Of this class the ordinary clasp-knife is perhaps the best known example. A sharp knife serves well for showing the different kinds of treatment by cutting or by fissure to which any particular wood or other moderately soft material is capable of submitting itself. The "thickness" of the cutting edge, or in other words, the angle which the intersecting planes which include it form with one another, the degree of smoothness or roughness of edge which best effects the clean division or separation of the fibres, and the possibility or otherwise of producing a smooth surface by "scraping," can all to a great extent be judged of with the aid of a knife. And the subject is by no means an unimportant one. Consideration of the action which takes place at the edge of a cutting-tool, and the strain which this action produces on particular portions of it are frequently of service in enabling us successfully to meet the special cases which arise in practice, and may sometimes guide us towards remedying the defective action of the hand-tools in use for ordinary work. America has long taken the lead in originating thoughtful improvements of this kind, and the result is apparent in the rapid manner in which the use of edge tools and appliances of American patterns is now everywhere extending.

1. In fig. 3 are shown a few of the ordinary English wood-tools. They include the firmer chisel (o) used by carpenters, and a carver's chisel (p) and gouge (q). A wood-engraver's scooper (r) and knife (s) are examples of special tools, being intended only for cutting hard wood in a direction transverse to the grain, cross-cut blocks of box-wood being alone used for the finer kinds of wood-engravings. The spoke-shave (t) affords a good example of what has just been said as to the result obtainable by a well-directed effort towards the improvement of an old established hand tool. In the form figured (l), which is the ordinary one in use in England, the blade or "iron" is rather complicated in shape and is not very easy to sharpen;

FIG. 3.—Chisels, planes, and saws.

each successive sharpening moreover impairs the efficiency of the tool by widening the "mouth," the unequal wear of the wooden sole, which very speedily takes place, having also a similar effect. Thus three essential conditions of a good cutting-tool, viz., constant maintenance of its proper action, durability of the parts exposed to wear, and facility in sharpening are all unfulfilled. On the other hand those manufactured in America fulfil them admirably; iron is substituted for wood as the material for the sole and handle, and the blade, which is merely a piece of flat steel, is firmly held in its place by a set screw, half a turn of which at once releases it.

Planes are to be met with in great variety, the most usual for ordinary carpentry being the jack plane (u), the trying plane, and the smoothing plane (v). Of these the first is used for taking off the rough, or for reducing the thickness of a board; the second, which resembles it, except in being of much greater length, for correcting inequalities of the surface; and the third, as its name implies, for the final smoothing. Planing being

chiefly performed in the direction of the grain of the wood, a smooth surface can only be obtained when its fibres are cut instead of being allowed to separate from one another by cleavage, the tendency to which, in soft woods more especially, must therefore be carefully resisted. With this object the planes above mentioned, and many others also, are provided with what is called a "double iron," an inverted blade or "iron" being securely attached to the upper side of the cutting iron, with its edge at a short distance only from the cutting edge. This causes the shaving to be continually broken transversely, and so prevents the fibres of which it is composed from tearing up those in advance of the cut. The width of the "mouth" or space between the cutting edge and the portion of the plane stock in front of it is also kept as small as possible in planes intended for smoothing, so as to increase to the utmost their breaking action by supporting the as yet undisturbed fibres in advance of the cutting edge. Wear of the mouth is sometimes prevented by letting in a metal plate or by forming the stock entirely of iron or steel. Planes of great length, which are known as jointers, are used for some purposes, coopers' planes of this kind being sometimes over 6 feet long.

The use of moulding planes (*w*) is indicated by their name. Each is adapted only for producing one particular pattern of moulding. Hollows and rounds resemble them, but have the cross section of their soles simply concave and convex respectively. For planing work which is hollowed or rounded in the direction of its length compass planes are employed, each of which, as ordinarily made, cannot deviate much from its own particular curvature. American ingenuity has here again stepped in, and has got over this objection by making the sole of a springy plate of steel, which can be adjusted to any curve either convex or concave within very wide limits, so that this one tool takes the place of an entire set of ordinary compass planes. Ploughs are somewhat complicated planes which are used for forming grooves of various widths, depths, and distances from the edge of the work.

The "pitch" of a plane is the angle at which the blade or iron is inclined to the sole, and the inclination is greater in hard-wood than in soft-wood planes. Some of the former, indeed, have their irons so nearly erect that their action is what would ordinarily be described as scraping and not cutting—a difference which appears to be undefinable, and to be due to the structure of the materials which can be so treated, and not, as has been suggested, to any peculiarity in the form of the cutting edge. The action of a razor in shaving seems to favour this view, the sections of hair thus obtained being seen under the microscope to be beautifully cleanly sliced, though the blade is applied at a great angle to the plane of the cut.

The following may be taken as good examples of saws—the hand saw (*x*), the rip saw and half-rip saw, which differ from it only in size and size of tooth, and the dovetail saw and tenon saw (*y*), of which the first three all have sufficient stiffness of blade to resist the force exerted in using them, and the last two are thin and unable to do this without the support of the iron or brass "back," which of course limits the depth to which a cut can be made with them. Pit saws and cross cut saws are the largest representatives of saws used by hand, being employed for large work, such as cutting timber in the log, and worked generally by two men. Frame saws of all sizes, from those of 8 feet or 10 feet used by pit sawyers down to the fret saws of but a few inches in length and scarcely thicker or wider than a horse hair, and compass saws, for cutting out curves, must also here be mentioned amongst hand-saws, though technically they are not included in the term.

In fig. 4 are some diagrams of saw teeth,—A being the usual form for all the smaller kinds that are used single-handed, which is varied however as to size and also as to the angle at which the "three square" file used in bringing the teeth to an edge is applied, while B is the gullet-tooth, for pit saws working with the grain of the wood, and C the ordinary cross-cut tooth, for transverse cuts. It is evident that a saw tooth which is well adapted for producing a clean cut in one of these directions would be ill-adapted for doing so in the other, at least in the case of the softer kinds of timber,—for in sawing with the grain the readiness and the uniformity with

FIG. 4.—Varieties of saw teeth.

which the short section of fibres sliced off by each tooth parts from the fibres by its side (owing to their slight lateral cohesion already alluded to) assists in the operation, and a fairly clean cut results. But in cross-cutting special provision is required for cleanly dividing the fibres at each side and cut, after which the removal of the intervening fragments can be accomplished readily by cleavage rather than by cutting. The rationale of the gullet-tooth (B) is thus clear, the keen chisel-like edges of the teeth being well adapted for slicing the fibres of the wood transversely, and for this it leaves little to be desired. The cross-cut tooth (C), consisting as it does of a series of lancet-like points acting alternately at each side of the

cut, divides the fibres, but has no proper provision for their after-removal, and the hand saw tooth (A) is a sort of compromise between the two (at least if we neglect the rounded portion of the gullet-tooth, which does not affect its edge), so that it can be used either with the grain or across it, though not with the best possible results. The cross-cut tooth (D), on the other hand, provides both for the clean separation of the fibres and the removal of their fragments.

The "set" of a saw is the slightly increased width given to its toothed edge by alternately bending the teeth towards the opposite sides of the blade; the extent to which this is done, or the width of the set (as it is called), therefore determines the amount of material which a saw wastes in forming its cut, the more perfect its action the smaller being the amount of set required to make it work freely, and the less the power expended in working it.

Some boring tools for wood are shown in fig. 5. The bradawl (E) is adapted only for soft wood; the gimlet, either in its plain or its twisted form (F), has little to be said in its favour; and the shell-auger (G) requires an expenditure of force altogether disproportionate to the results produced by it. The screw-auger is an improvement upon it, although this, as generally made, still leaves a good deal to be desired as regards consumption of power. But the wood-worker's main stand-by for boring is the stock or brace (H) and set of bits. Those ordinarily supplied for

FIG. 5.—Boring tools.

boring across the grain consists mainly of centre-bits (I) for the larger and quill bits for the smaller holes,—neither of which are thoroughly efficient tools,—also nose-bits (J), which resemble shell-augers and share their defects, for boring with the grain. The English wood-boring tools indeed offer a considerable field for improvement. Imported substitutes for the above are already to be met with, amongst others being the twisted centre-bits, of which the stems resemble the twist drill referred to below, and the expanding centre-bits, both of which appear to be an advance in the right direction, though they have not as yet come largely into use.

2. Cutting tools for metal analogous to the foregoing are but few as regards surface work. Their chief characteristic—at least in the case of those used for the harder metals—is the greatly increased thickness of their edges. Files of various cross sections, lengths, and degrees of fineness of tooth, and scrapers (which are merely thick knife-edges, made not unfrequently from worn-out files by sharpening them at the extremity), constitute almost the only edge tools at the disposal of the fitter or mechanic for finishing work that he has roughly surfaced with his chipping chisels. For boring he has drills of various sizes, too often of the antiquated pattern (K), which in boring deep holes cannot be kept straight, though the very superior twist drill (L) is now often to be met with. Countersinks, either of the flat (M), rose (N), or snail-horn pattern (O), are generally included with carpenters' sets of bits, for enlarging holes in metal work to receive the heads of screws. They are used with the wooden brace figured above. The smith's brace resembles it, but is all made of iron, and a heavy pressure is applied to its upper end by means of a screw. A ratchet brace (P) is a more powerful instrument, and carries in itself the screw for obtaining the requisite pressure. Small holes can be drilled under a light pressure with rapid rotation on the part of the drill, which is then generally of the form K, but sharpened from both sides, so as to form a knife-edge which operates equally well in whichever direction the drill revolves. The drill bow, of which the string takes one turn round a bobbin either on the stem of the drill itself or on its holder, is a ready means of obtaining a rapid reciprocating motion for this purpose, and is not yet superseded, though various ingenious substitutes have been devised. For enlarging holes throughout their length broaches or rimers are used; these may be either simply half round or polygonal in section, or may have any desired number of longitudinal or spiral flutings, each of which forms a cutting edge which removes successive portions for the sides of the hole to be enlarged. A parallel rimer with four flutings is shown at R, the square end when in use being inserted in a hole in the centre of a wrench, which affords the requisite leverage.

An internal screw thread is formed in an analogous manner by a

tap, which bears on its surface the counterpart of the required thread, so that by successive cuts it produces a helical groove of the correct form and depth. Such a tap (S) is represented in the engraving, together with a diagram of its cross section, showing the three cutting edges by which the screw thread is formed. Three such taps constitute a set for any one size of screw, the first being known as a tanner, the second as an intermediate, and the third

Fig. 6.

as a plug-tap, this last being almost parallel throughout. By a reverse process with dies fixed in a stock (T, fig. 6) external screws are cut, the particular form shown being the improved pattern of Sir J. Whitworth, who has done much to correct the faults of the earlier screwing tools. Screw plates, however, some of which cannot be regarded as cutting tools at all, are still much used for small and fine screw threads.

Cutting pliers and cutting nippers (U) have a pair of knife edges so arranged as to work exactly opposite to one another,—the handles, on being tightly grasped, affording sufficient leverage for these edges to be forced to a short distance into the two opposite sides of a nail or wire, which, if of small diameter or of soft metal, can thus be cut asunder. Tube-cutters are an ingenious device which the extensive use of wrought-iron tubing for gasfitting has rendered necessary. They effect their object by cutting a groove round the tube to a sufficient depth to enable it to be fractured at the desired point.

3. *Stone and hard materials cannot in general be treated by cutting tools simply with hand pressure, though some of the softer kinds of stone are carved with chisels used almost or altogether without impact, and are sawn with toothed saws resembling the cross-cut saws used for wood.* Glaziers' diamonds were till recently the only tools for producing the peculiar "cut" requisite for starting the clean fracture by which sheet glass is divided, theirs, however, being a case of fissure rather than of true cutting. But of late years steel glass cutters have been introduced which act—as long as the sharpness of their edges is maintained—in a manner precisely similar. In one form of these glass cutters (V) a cast-iron handle carries at its extremity a small freely revolving wheel of carefully hardened steel, round the circumference of which is the cutting edge, which can be sharpened on an oilstone when necessary. The so-called cut is produced by simply running this with a light pressure over the surface of the glass. Diamonds, however, are used for cutting glass, stone, &c., by actually detaching their particles; writing diamonds and diamond drills have this kind of action.

11. *Hand-tools without cutting action.*—With the exception of hammers and a few tools which are dependent on impact,—such as cleaving wedges amongst wood tools, and embossing and similar punches amongst those for metal,—tools of this class play in general only a subsidiary part to some cutting or other process.

Amongst those used with pressure which cannot be considered as auxiliary may be instanced—draw-plates, with which wire is made by drawing it through holes of conical form and of successively smaller diameters till the required size or "gauge" is reached; and burnishers, which reproduce on metals softer than themselves their own highly polished surfaces. Both of these act by inducing a flow of the metal under treatment for which, when it is not effected by impact, great force is required in proportion to the extent of the action. Metal shears and cutting punches of all kinds have been omitted till now, as their mode of operating cannot be regarded as true cutting from our point of view. It may be more correctly described as tearing, more or less completely localized according to circumstances. The ordinary sheet-metal shears (W) merely resemble very powerful scissors, and, their action being quite local, they serve well for dividing the plates or other thin sheets for which alone they are suitable. Block shears (X) act with additional leverage, and can consequently be used for rather thicker metal, the upper bow being replaced by a long straight handle, and the lower one by a stake which can be firmly fixed in a block of wood or otherwise. With these the tearing action begins to be apparent, though its imperfection is of no great importance with the thicknesses of metal capable of being treated by any hand shears (for some tools of this class, which by hydraulic or other means accumulate the power of one man to a sufficient extent to operate on bars or

plates of comparatively great substance, are machines rather than hand tools, and in their case the mere slowness of the operation produces better results than would otherwise be obtained). The same may be said of the various punches used in combination with dies or bolsters, as in the punching bear (Z), of which the action exactly resembles that of shears, the punch taking the place of the upper blade, and the bolster that of the lower one.

Of subsidiary tools (figs. 7) the vice is an absolute essential for the generality of metal workers. The ordinary tail-vice (a) used by mechanics has not yet been largely superseded, though many ingenious arrangements have been devised for remedying its main defect, viz., the want of parallelism in the movement of the jaws. The English parallel vice (B) has not this objection, but its construction is not good mechanically, and it is but little used except for small work. In some patterns of vice, jaws are provided with a horizontal adjustment so as to grip tapering or other irregular forms, and in others the whole body of the vice can be awiddled

Fig. 7.

either vertically or horizontally. Hand-vices are used in the manner implied by their name, without being attached to a bench like the foregoing. An ingenious form of hand-vice (gamma) is shown in fig. 7. The screw wrench (delta), which is used for turning nuts, &c., of various sizes has of late been deservedly the subject of various improvements in which weight is sought to be saved without sacrifice of strength; and the shifting spanner, of which the duty is the same, has led to the exercise of much ingenuity without any perfectly satisfactory solution of the problem how it may best be constructed. The merit and simplicity of the ordinary screw-driver, on the other hand, are well known.

Instances of tools which afford a powerful grip by simple means are the blacksmith's tongs (epsilon), the vice-chop tongs (zeta), the pliers (eta), and the pincers (theta). A very powerful modification of the last-mentioned tool has lately been introduced into use under the name of the nail-puller (iota). With this ingenious instrument very largely increased leverage is obtained, and the pull is given in a direction much more advantageous to the attainment of the desired object. (C. P. B. S.)

HANG-CHOW-FOO, a city of China, in the province of Che-Keang, about 2 miles north-west of the Tseen-tang-Keang, at the southern terminus of the Imperial Canal, by which it communicates with Peking. It lies about 100 miles south-west of Shanghai, in 30° 20' 20" N. lat. and 120° 7' 27" E. long. Towards the west is the Si-hu or "Western Lake," a beautiful sheet of water, with its banks and islands studded with villas, monuments, and gardens, and its surface traversed by gaily-painted pleasure boats. To the Chinese it is a very paradise. Exclusive of extensive and flourishing suburbs, the city has a circuit of 12 miles; its streets are well-paved and clean; and it possesses a large number of arches, public monuments, temples, hospitals, and colleges. It has long ranked as one of the great centres of Chinese commerce and Chinese learning. In 1869 the silk manufactures alone were said

to give employment to 60,000 persons within its walls, and it has an extensive production of gold and silver work and tinsel paper. On one of the islands in the lake is the great Wau-lan-ko or pavilion of literary assemblies, and it is said that at the examinations for the second degree twice every three years from 10,000 to 15,000 candidates come together. In the north-east corner of the city is the Nestorian church which was noted by Marco Polo, the façade being "elaborately carved and the gates covered with elegantly wrought iron." There is a Roman Catholic mission in Hang-chow, and the Church Missionary Society, the American Presbyterians, and the Baptists have likewise stations. The local dialect differs from the Mandarin mainly in pronunciation. The population, which is remarkable for gaiety of clothing, was formerly reckoned at 2,000,000, but is now variously estimated at 300,000, 400,000, or 800,000.

Hang-chow-foo is the Kinsai of Marco Polo, who describes it as the finest and noblest city in the world, and speaks enthusiastically of the number and splendour of its mansions and the wealth and luxuriance of its inhabitants. According to his authority it had a circuit of 100 miles, and no fewer than 12,000 bridges and 3000 baths. The name Kinsai, which appears in Wassaf as Khanzai, in Ibn Batuta as Khansa, in Ordericus as Camsay, and elsewhere as Campsay and Cassay, is really a corruption of the Chinese *King-se*, capital, the same word which is still applied to Peking. From the 10th to the 13th century (960-1272) the city, whose real name was Lien Ling-nan, was the capital of Southern China and the seat of the Sung dynasty, which was dethroned by the Mongolians shortly before Marco Polo's visit. Up to 1861, when it was laid in ruins by the Taipings, Hangchow continued to maintain its position as one of the most flourishing cities in the empire, and though for a time it lay comparatively desolate, it has considerably recovered within recent years. It is the seat of the governor of Che-Keang; but the governor-general or viceroy for Che-Keang and Fuh-Keen is now located at Fuh-chow. See Colonel Yule's edition of Marco Polo, vol. ii., for a plan of the city and further details.

HANKA, WENCESLAUS or WAKLAW (1791-1861), a Bohemian philologist, was born at Horeniowes, a hamlet of eastern Bohemia, on June 10, 1791. He attended the village school in winter only, being occupied during the summer on his father's farm. While still young he acquired a knowledge of Polish and Servian from some soldiers billeted in the neighbourhood, and in 1807 he was sent to school at Königgrätz, to escape the conscription. Proceeding then to Prague, he engaged in the study of philosophy, and founded a society for the cultivation of the Czech language. At Vienna, where he afterwards studied law, he established a Czech periodical; and in 1813 he made the acquaintance of Dobrowsky, the eminent philologist. On September 16, 1817, Hanka made the discovery of some ancient Bohemian manuscript poems of the 13th and 14th century in the church-tower of the village of Kralodwor, or Königinhof. These were published in 1818, under the title *Kralodworsky Rukopis*, with a German translation by Swoboda. Great doubt, however, was felt as to their genuineness; and Dobrowsky, by pronouncing *The Judgment of Libussa*, another manuscript found by Hanka, an "obvious fraud," confirmed the suspicion. But some years afterwards Dobrowsky saw fit to modify his decision; and in 1840, after a careful examination of the manuscripts by two eminent antiquaries, Hanka was ultimately vindicated. A translation into English, *The Manuscript of the Queen's Court*, was made by Wratislaw in 1852. The originals were presented by the discoverer to the Bohemian Museum at Prague, of which he was appointed librarian in 1818. In 1848 Hanka took part in the Slavonic congress and other peaceful national demonstrations, being the founder of the political society Slovanska Lipa. He was elected to the imperial diet at Vienna, but declined to take his seat. In the winter of 1848 he became lecturer and in 1849 professor of Slavonic languages in the university of Prague, where he died, January 12, 1861.

His chief works and editions are the following:—*Hankowy Tjznr* (1818), a volume of poems; *Starobyta Skladanie* (1817-1823), in 5 vols.,—a collection of old Bohemian poems, chiefly from unpublished manuscripts; *A Short History of the Slavonic Peoples* (1818); *A Bohemian Grammar* (1822) and *A Polish Grammar* (1839),—these grammars were composed on a plan suggested by Dobrowsky; *Igon* (1821), an ancient Russian epic, with a translation into Bohemian; a part of the Gospels from the Rheims manuscript, in the Glagolitic character (1846); the old Bohemian Chronicles of *Dalimil* (1848) and *Procop Lupac* (1848); *Evangelium Ostromis* (1853).

HANKOW (that is, the "Mouth of the Han"), the great commercial centre of the middle portion of the Chinese empire, and since 1858 one of the principal places opened to foreign trade. It is situated on the northern side of the Yang-tse-kiang at its junction with the Han river, about 450 miles west of Shanghai in 30° 32' 51" N. lat. and 114° 19' 55" E. long., at an absolute height of 150 feet. By the Chinese it is not considered a separate city, but as a suburb of the now decadent city of Hanyang; and it may almost be said to stand in a similar relation to Wu-chang the capital of the province of Hupeh, which lies immediately opposite on the southern bank of the Yang-tse-kiang. Hankow extends for about a mile along the main river and about two and a half along the Han. It is protected by a wall 18 feet high, which was erected in 1863 at an expense of £250,000, and has a circuit of about 4 miles. In 1861 the port was declared open by James Hope and Sir Harry S. Parkes, C.B., and the site of a British settlement was selected in the east end of the town, with a river frontage of 2400 feet, and a depth of from 1200 to 1500. The building area, divided into 108 lots, was quickly bought up, and houses after the Shanghai style were erected. Leases were granted to foreigners as well as to British subjects. A municipal council was formed, and by 1863 a great embankment and a roadway were completed along the river, which has the awkward fashion of rising as much as 50 feet or more above its ordinary levels, and not unfrequently, as in 1849 and 1836, lays a large part of the town under water. On the former occasion little was left uncovered but the roofs of the houses. The success of the foreign settlement has not been so great as was anticipated: even in 1866 the number of foreign residents was 125 instead of 150 as in 1863. Chinese merchants have rapidly got even the foreign trade into their hands: in 1873 they began to run steamers on the river; in 1875 they purchased the property of the Shanghai Steam Navigation Company; and in 1876 they had 57 steamers flying the national flag. Besides tea, which is the staple, the exports of Hankow are leaf tobacco, of which 6,700,000 lb was sent to Europe in 1876, raw silk mainly obtained from Szechuen, rhubarb, gall-nuts, and musk. Of this last the quantity was as much as 2937 lb at £20 sterling per lb. Tea was first sent direct to London in 1864-65; in 1876 this market received from Hankow no less than 34,540,000 lb out of a total export of 86,402,271 lb. The Russian merchants, who are fixing their brick-tea factories in the town, obtained 12,844,476 lb in the same year. They send their goods by water to Tientsin, and thence to Kalgan partly by land and partly by water. A public assay office was established at Hankow in 1864. The Roman Catholics, the London Missionary Society, and the Wesleyans have all missions in the town; and there are two missionary hospitals. Before the Taiping wars, the full brunt of which fell on this part of the country, the sister cities of Hankow, Hanyang, and Wu-chang-fu had a population, it is said, of over 5,000,000. At present Hankow has from 600,000 to 800,000 (Sossnowsky says only 300,000), and the other two from 400,000 to 500,000.

HANLEY, a market-town and municipal borough of Staffordshire, England, is situated in the centre of the pottery district, 2 miles E.N.E. of Stoke-upon-Trent, and 18 miles N. of Stafford. It is indebted for its rise and

prosperity to its pottery manufactures, which include porcelain, encaustic tiles, and earthenware, and give employment to the greater part of the population, women and children being employed almost as largely as men. In the neighbourhood coal and iron are obtained. The streets, which are paved with brick, are wide and regular, and in the suburbs there are a number of fine villas. The principal public buildings are the six churches (St John's being a handsome structure with a tower 100 feet in height) and the dissenting chapels, the town-hall, the mechanics' institute, the museum, the theatre, and the national and board schools. There is also a flourishing Government school of art. Hanley, which includes the former township of Shelton, received a municipal constitution in 1857. It is the central and most important of the group of towns constituting the parliamentary borough of Stoke-upon-Trent. The population of Hanley in 1861 was 31,953, and in 1871 39,976.

HANNAY, JAMES (1827-1873), critic, novelist, and publicist, was born at Dumfries in 1827, and came of the Hannays of Sorbie, an ancient Galloway family. He entered the navy in 1840 and served till 1845, when he adopted literature as his profession. In 1857 Hannay contested the Dumfries burghs in the Conservative interest, but without success. He edited the *Edinburgh Courant* from 1860 till 1864, when he removed to London. In July 1868 he was appointed British consul at Barcelona, a post which he occupied till his death on the 8th of January 1873. While at Barcelona he contributed to English periodicals; and his letters to the *Pall Mall Gazette* "From an Englishman in Spain" were highly appreciated. Hannay's best books are *Singleton Fontenoy*, *Satire and Satirists*, *Eustace Conyers*, and *Essays from the Quarterly Review*. *Satire* not only shows loving appreciation of the great satirists of the past, but is itself instinct with wit and fine satiric power. The book sparkles with epigrams and apposite classical allusions, and contains admirable critical estimates of Horace (Hannay's favourite author), Juvenal, Erasmus, Sir David Lindsay, George Buchanan, Boileau, Butler, Dryden, Swift, Pope, Churchill, Burns, Byron, and Moore. The *Essays* are full of learning and historical knowledge, and are lit up with sunny humour and brilliant flashes of wit and poetry. Hannay passionately admired three things—learning, literary genius, and good blood. He showed great interest in the history and fortunes of aristocratic families; and his wonderful skill in matters of heraldry and genealogy is recognized by highly competent authorities (see Masson's *Life of Milton*, vol. i. p. 8). He was a ripe Latin scholar; and his style is marked by grace, vivacity, and poetical feeling. He was intimate with his leading literary contemporaries, and wrote the valuable notes to Thackeray's *English Humorists*.

In addition to contributions to *Punch* and the leading reviews, Hannay issued the following works:—*Biscuits and Grog*, *Claret Cup*, and *Hearts are Trumps* (1848); *King Dobbs* (1849); *Sketches in Ultramarine*; *Singleton Fontenoy* (1850); an edition of the *Poems* of Edgar Allan Poe, to which he prefixed an exquisite essay on the poet's life and genius (1852); *Sands and Shells and Satire and Satirists* (1854); *Eustace Conyers* (1855); *Essays from the Quarterly Review* (1861); *Characters and Criticisms*, consisting mainly of his contributions to the *Edinburgh Courant* (1865); *A Course of English Literature* (1866); and a family history entitled *Three Hundred Years of a Norman House* (1867).

HANNIBAL. Hannibal was a very common Carthaginian name. Its final syllable *bal* occurs repeatedly, as a suffix, in Punic names, and is in fact taken from the chief Phœnician deity, Baal. The entire name denotes, according to a probable interpretation, "the favour of Baal."

The famous Hannibal, the hero of the Second Punic War, was the son of Hamilcar Barca, and was born in 247 B.C. He and his two brothers, Hasdrubal and Mago, were called by the father "the lion's brood." At the age of nine he

begged his father, who was leaving Carthage for Spain, to take him with him. The request was granted, but not before he had sworn at that father's bidding on the altar of sacrifice eternal enmity to Rome. That vow determined his life's future. In Spain he was bred up in camps under his father's eye. He was present at the battle in which his father fell in 228 B.C., being then in his nineteenth year. Hamilcar's son-in-law, Hasdrubal, succeeded to the command. Eight years afterwards, in 221 B.C., he was struck down by an Iberian assassin. Meantime the young Hannibal had proved himself thoroughly able both "to obey and to command." It was a matter of course that the soldiers with one voice at once hailed him as their general.

His first object was to complete the work of his father and his father's successor. Spain, he felt, must be more thoroughly overawed, if it was to be a base of operations against Rome. He pushed into the heart of the country, crossed the Tagus, and crushed the resistance of the tribes of the interior. Two campaigns sufficed for the conquest of all Spain to the south of the Ebro, except Saguntum, a town considerably south of the Ebro and some way to the north of the modern Valencia. It was a Greek colony from Zacynthus (Zante), and had grown into a rich and prosperous place, but, what was now far more important, it was in friendly relations with Rome. To attack it therefore would be like throwing down the gauntlet to the Roman senate and people. But Hannibal was able to tell the home Government at Carthage that the Saguntines were molesting Carthaginian subjects in the neighbourhood. Without awaiting an answer, he began the siege. Roman ambassadors at the solicitation of envoys from Saguntum landed on the coast, but were told by Hannibal that he could not see them. They went on to Carthage, but their remonstrances, though the subject of a long debate, were in vain. Eight months passed away, and Saguntum, after a gallant defence, was forced to surrender. Hannibal got a rich booty for his army, and went into winter quarters at New Carthage (Cartagena). Again a Roman embassy went to Carthage and insisted on his being given up. The demand was refused. By the close of the year 219 B.C. the Second Punic War was in fact begun.

Hannibal's resolution was now taken. He prepared at once to invade Italy. He had a numerous and efficient army and a well-filled exchequer. All who shrank from the expedition he dismissed to their homes. In the spring of 218 B.C. he began his great march from New Carthage with an army of 90,000 foot, 12,000 horse, and 37 elephants. The Ebro was easily crossed. In the country beyond he had some fighting with the native tribes, and there he left Hanno, with a force of 10,000 foot and 1000 horse to secure the passes between Spain and Gaul. Again he sent back all in whom he saw signs of hesitation. With a considerably diminished army he passed the Pyrenees at Bellegarde and encamped at Iliberris (Elae). Some Gallie tribes, alarmed at his advance, had assembled in the neighbourhood, but he soon conciliated their chiefs and persuaded them that he meant them no mischief. So he continued his march without molestation to the Rhone.

Meanwhile the Romans had done little or nothing to check their enemy. At last the consul, Publius Cornelius Scipio, arrived at Massilia (Marseilles), and was surprised to find that Hannibal was about to cross the Rhone. But he was too late to oppose the passage, and Hannibal crossed the river probably at some point near the village of Roquemaure. He then followed its course, marching up its left bank to its junction with the Isère at Valence, and entered what was known as the "Island of the Allobroges." It was from thence that he began his famous passage of the Alps.

The narrative of Polybius, though it raises some difficult

questions, has conveyed to most modern students and scholars the impression that Hannibal crossed by the pass of the Little St Bernard. If so, he must have entered Italy by the valley of Aosta. The subject has had a literature of its own devoted to it. The result is that the Little St Bernard Pass may be almost said to have made good its claims to the honour of Hannibal's memorable march. It was familiar to the ancients, and more than once Gauls had passed through it into the plains of Italy. Such high authorities as Arnold, Niebuhr, and Mommsen regard the question as settled in its favour.

Fifteen days in all were occupied in the passage. If the view above indicated is correct, Hannibal at first made his way over Mont du Chat through the Chevelu Pass, then continued his march up the valley of the Isère, and mounted the St Bernard. He must have descended the mountain by the valley of the Doria. Part of his route, that by which he climbed to the summit, was a narrow defile, and there he was threatened by the mountain tribes which appeared on the heights. At the "white rock," *la roche blanche*, as it is still called, he halted his infantry, while the cavalry and beasts of burden were making their way during the night to the top of the pass. Next day, the ninth day, he stood with his whole army on the highest point and spoke, it is said, some cheering words to his half-frozen Africans and Spaniards. The descent proved trying and dangerous. From the mountain tribes he had little to fear; it was the mountain slope, covered with recent snow, which caused delay and anxiety. The Italian side of the Alps is considerably steeper than the French side, and a road had to be constructed for the passage of the elephants and horses. This was a work of three days. In three more days they arrived in the valley of Aosta, and were welcomed by the Salassi, a friendly tribe of the Insubrian Gauls. The October of the year 218 B.C. saw the passage of the Alps accomplished and Hannibal with his army encamped in northern Italy.

Thus far he had been successful, but at a tremendous cost. His army was shrunk to a force of 20,000 infantry and 6000 cavalry,—the former being composed of Libyans and Spaniards in about the proportion of three to two, and the latter being chiefly Numidians, and admirably efficient.

It was now five months since he had set out from New Carthage. His men of course sorely needed rest, and this they had for a brief space amid the friendly tribes of Cisalpine Gaul. One tribe indeed, the Taurini, was hostile, but he soon captured their chief city, thus overawing the remaining tribes in the upper valley of the Po. It was now high time for the Romans to exert themselves. Scipio after quitting Marseilles, whence he had sent on his army into Spain, had hurried back to Italy, and on reaching Placentia took command of the Roman army quartered there. He was indeed numerically weaker than Hannibal, and was deficient in cavalry. Still he advanced up the Po to meet him, and on the Ticino, somewhere, it would seem, near Vercelli, was fought the first engagement of the Second Punic War. It was a cavalry action, and the inferiority of the Romans in this arm was decisively proved. They were driven back with heavy loss, and Scipio himself was severely wounded, being rescued, it is said, by his son, a lad of seventeen, who subsequently became as famous as Hannibal himself, and had the good fortune to be his conqueror. He has gone down to posterity as Scipio Africanus. The defeated general fell back to the walls of Placentia. The Trebia, a southern tributary of the Po, was between him and the enemy, and he was soon joined by the other consul, Sempronius. Their united armies numbered not less than 40,000 men. Sempronius was for instantly giving battle; Scipio was still disabled by his wound.

Sempronius had his way, and on a bitterly cold December day the Romans plunged into the swollen waters of the Trebia in the face of a sleet storm and a cutting wind. They fought well, but when taken in flank by Hannibal's brother Mago, who was lying in ambush amid brambles and bushes in a watercourse, they broke and fled in utter rout.

This decisive victory gave nearly all northern Italy to Hannibal. He let his troops rest during the winter, and added to them a number of Gauls. Early in the spring of 217 B.C. he decided to cross the Apennines and to penetrate into the heart of Italy. The route which he took brought him into the marshy lowlands of the Arno near Lucca and Pisa, and here he and his men had to wade through water for four days. Many of them perished miserably, and Hannibal himself lost an eye from ophthalmia. At last he encamped at Fiesole on high ground. The two consuls Flaminius and Servilius were, with their armies, respectively at Arezzo and Rimini. Flaminius was an impetuous man, and eager to win the glory of settling the war once for all. Hannibal, quitting the valley of the upper Arno, marched past him towards Perugia, ravaging the country and so provoking the Roman general to pursue him. The road from Cortona to Perugia skirts the northern shore of Lake Trasimene, and into this road, which is in fact a mountain defile, the Roman column unwarily entered. They were caught in a trap. Hannibal had posted his light troops on the hills on either side, while he himself blocked the outlet near Passignano with the best of his infantry. As soon as the Romans were in the pass they were assailed on all sides, and the battle soon became a mere massacre. The Roman army was in fact destroyed, and Flaminius was among the slain. We might suppose that Hannibal would have now done well to have marched straight on Rome, and this the Romans expected. But he may well have thought that it would be better to wait the chance of insurrection among the Italian communities. So he marched through Umbria, and again crossed the Apennines into Picenum. He then marched southwards along the coast into Apulia and encamped at Arpi. Meanwhile the Romans had made the famous Fabius Maximus their dictator. After levying an army of four legions, Fabius marched in pursuit of the enemy having first effected a junction with the army under Servilius at Rimini.

From the first Fabius had decided on the policy which earned for him the name of the *Cunctator*, the Delayer. He dogged his enemy's steps, but would never risk an engagement. The richest districts of southern Italy were laid waste under his very eyes. But he could not be provoked into any rash movement. Once indeed it seemed as if Hannibal was himself entrapped. He had been ravaging Campania, and was on the point of retreating into Samnium, when Fabius posted a force at the head of the pass which afforded the only available means for his retreat. Hannibal is said to have driven a multitude of oxen with lighted faggots on their horns up the hills overhanging the road, so as to give the impression that he and his army were retreating over the heights. Fabius's detachment quitted its position to check the supposed movement, and thus gave Hannibal an opportunity of escaping through the pass. The tactics of Fabius disgusted his men, and when he had to leave them for a time, he found on his return that his master of the horse, Minucius, on the strength of a small success won in his absence, was eager to bring on a general engagement. Fabius gave him a part of the army, with which Minucius ventured on an attack. He was on the brink of destruction when he was rescued by the dictator's timely interposition. After this Hannibal went into winter quarters at Geronium in the north of Apulia.

In the spring of the next year, 216 B.C., he moved south and pounced on Cannæ, where Roman supplies were stored up in great abundance. The town is about 6 miles from the mouth of the Aufidus and about 8 from Canosa. The Romans were now again eager to strike a decisive blow. So a vast army was raised by the consuls of the year, Æmilius Paulus and Terentius Varro, numbering 80,000 infantry and 6000 cavalry. Hannibal's army was probably far inferior numerically. The consuls on arriving in Apulia made Canusium (Canosa) their headquarters. For some few days the armies faced each other on the banks of the Aufidus. There were some preliminary manoeuvres and skirmishes, till at last Varro, when it came to his turn to command, determined to fight. Both armies crossed the river, and Hannibal's men were drawn up within a loop which it forms near Cannæ. On either flank he stationed a strong body of his veteran infantry. His other infantry, ranged in the centre in a crescent form, was soon driven in by the Roman legions, which had advanced to the attack in very deep formation. But meanwhile Hannibal's cavalry had put the Roman horse to rout, and had fallen on their rear. The Roman columns were now attacked also on either flank by the Carthaginian infantry. Pressed into a dense mass they were cut down without the possibility of resistance. The carnage is said to have been prolonged for eight hours. The Roman army was all but utterly destroyed. The consul Æmilius Paulus, nearly all the officers, and eighty senators, perished in the slaughter. Varro indeed escaped with a few horsemen to Venusia. The remainder were slain or made prisoners. It was at a comparatively small cost to himself that Hannibal won this great victory.

It might well be thought that such a victory would prove decisive, and that it must have been had Hannibal instantly pushed on to Rome. But he had probably good reasons for not doing so. He was, it must be remembered, as much as 200 miles from Rome; he would have had to march through still hostile populations, and by the time he would have arrived, he must have known that the first panic would have abated, and that the notion of carrying the city by a *coup de main* was simply preposterous. What he counted on was the dissolution of the Italian confederacy, and a widespread revolt throughout Italy. Nor was he altogether deceived. The disaster of Cannæ shook the loyalty of the Italian peoples. Rome was deserted by most of Apulia and Samnium, and almost wholly by the Lucanians and Bruttians. She retained indeed some strong fortresses, as Cales, Fregellæ, Casinum, Beneventum, Venusia, and these enabled her armies to maintain their ground. But Capua, in Campania, the richest and most powerful city in Italy after Rome itself, was lost to her. Thither Hannibal made his way from Cannæ, and there he went into winter quarters, which were perhaps too comfortable and luxurious. But the story that his men became utterly demoralized is absurd. They proved in the subsequent years of the war that they could move rapidly and fight bravely. We may indeed well suppose that by this time many of his veteran Spaniards and Africans had been replaced by native Italian soldiers. It is, however, clear that he still had a fine army. It is true indeed that after Cannæ his star seems rather to decline, but the explanation of this is that the Romans again reverted to the steady cautious tactics which they had learnt under Fabius. They too were for the most part well officered. The ablest of their generals was Marcellus. Yet even he never beat his antagonist in anything like a pitched battle. The Romans after Cannæ made prodigious efforts. They sent three armies into the field, to watch and to check the enemy's movements. They kept themselves in strongly entrenched camps near fortresses which Hannibal had not the means

of taking. Some indeed he did capture, as Nuceria, Accræ, and Casilinum in Campania. At Cumæ, Neapolis, and Nola he was foiled. The two years after Cannæ, 215 and 214 B.C., passed without much being achieved on either side. Hannibal was vaguely hoping for reinforcements from Carthage, and for the aid of Philip, king of Macedon.

Next year, 213 B.C., he gained a considerable success. Tarentum surrendered, and so did Metapontum and Thurii. At Tarentum indeed the Roman garrison still clung to the citadel, and Hannibal could not dislodge it. From Carthage he had received a reinforcement of some elephants and of 4000 Numidian cavalry, but this did not enable him to resume the offensive with much effect. Meanwhile Capua, besieged by two consular armies, seemed doomed to fall again into Roman hands. One of Hannibal's subalterns, Hanno, was defeated in the attempt to re-occupy the place. Hannibal himself hurried to its aid, but he could not bring the Romans to a battle, though he did temporarily raise the siege. The year 212 B.C. was one of mingled success and disaster for Rome. Syracuse that year had to surrender to Marcellus, and Carthage seemed to have quite lost Sicily. Here was an important gain for Rome. But in Spain the two brother Scipios had been cut off by Hasdrubal, who could now cross into Gaul and advance on Italy. And in Italy there had been some serious reverses. It would appear that there were actually six Roman armies in the field against Hannibal. One of these under Fulvius he destroyed in Apulia; another, made up of enfranchised slaves under Gracchus—a proof this of the extremity to which Rome was reduced—he put to rout, Gracchus himself perishing in an ambuscade.

By the spring of 211 B.C. the Romans were besieging Capua with three armies. It was clear that the city must fall, unless Hannibal could come to its rescue: He made the attempt indeed, but he could not break the hostile lines, so strongly were they entrenched. Then he conceived the idea of drawing them off by menacing Rome itself. Now for the first time he marched through Latium and made it taste all the horrors of war. At last he encamped 3 miles from Rome on the Anio. But the Romans did not lose their presence of mind, or even relinquish the siege of Capua; they simply recalled Fulvius with one of the armies. There were two legions within the city, and Hannibal probably never meditated a serious assault. He ravaged the country up to the walls, but he did nothing more. Through Samnium he again marched into Apulia and thence into Bruttium, where he unsuccessfully attacked Rhegium and the citadel of Tarentum. Capua meanwhile was forced to surrender. This greatly discouraged Hannibal's Italian allies. Marcellus too had come back from Sicily after his capture of Syracuse. Altogether the year 211 B.C. was a very unpromising one for Hannibal. Next year, 210 B.C., however, he partly recovered lost ground by completely defeating the Roman prætor Cneius Fulvius at Herdonea, the modern Ortona, in Apulia. But he could not follow up this success, and his evident weakness led to the speedy return of Samnium and Lucania to the Roman confederacy. The following year saw Tarentum slip from his grasp. But he soon had his revenge. Next year the two consuls, Crispinus and Marcellus, were both cut off and slain by the Numidian cavalry in the neighbourhood of Venusia. Another disaster soon followed. A Roman army was besieging Loeri in the extreme south. It was routed and indeed destroyed by Hannibal. Thus at the close of the year 208 B.C. the struggle was clearly by no means decided.

Rome had been making immense efforts. We hear of her having twenty-three legions under arms, and possibly the total number of her armies may have reached 200,000 men. The patriotic spirit of her citizens was still at the highest. But her finances were in a deplorable plight, and

corn had risen to an almost famine price. The country round must have been woefully wasted, and multitudes reduced to beggary. One thing indeed the Romans had had to console them during these trying years. The Latin communities in Etruria and Latium had stood by them with wonderful fidelity. This had been their salvation. But now in the years 209 and 208 B.C. came signs of discontent and wavering. Of the Latin colonies several declared that they could no longer furnish contingents or contributions. There were rumours too of a disloyal movement in Etruria. But, worst of all, there came news in the autumn of 208 B.C. that Hasdrubal had crossed the Pyrenees. By next summer he would have passed the Alps. Should the two brothers unite their forces, Rome's fate, it could hardly be doubted, would be sealed. She was now in far greater jeopardy than she was even after the disastrous day of Cannæ.

The year 207 was thus a very anxious one. Claudius Nero and Marcus Livius were the consuls. The first was to watch Hannibal in Apulia, the other was to encounter Hasdrubal in Cisalpine Gaul. Livius retreated before the new invader, and let him reach Sena in Umbria, to the south of the river Metaurus, without opposition. Thence Hasdrubal sent despatches to his brother, who was at Canusium in Apulia. The plan was that they should join their armies at Narnia on the Flaminian road, between 50 and 60 miles from Rome. Unluckily for the two brothers the despatches fell into the hands of Nero. His resolution was formed in a moment. Leaving the bulk of his army in its camp, he hurried northwards with 7000 of his best troops, and after a rapid march of 200 miles he joined Livius. The two generals forced Hasdrubal to a battle. The Carthaginian was utterly defeated, and he was himself slain. Nero returned with all speed to his army, and informed Hannibal of the defeat and death of his brother by having the head of Hasdrubal flung into his camp. With that sight all hope must have died in Hannibal's heart. The battle of the Metaurus was indeed one of the decisive battles of the world. It decided the Second Punic War. From that time, for four more years, Hannibal could but stand on the defensive in the southernmost corner of the Italian peninsula. But even to the last no Roman general dared to close with him. Never in a single battle, as Polybius says, was he beaten while in Italy. Before quitting the country, he left a memorial of his wonderful achievements. In the temple of Juno on the Lacinian promontory, near Crotona, he inscribed on brazen tablets in Punic and in Greek an account of his expedition and his campaigns. Polybius saw the inscription and doubtless availed himself of it for his history. For fifteen years Hannibal had maintained himself in Italy, ravaging it from end to end, and inflicting on the Romans according to their own calculation a total loss of 300,000 men. Now all was clearly over. After Nero's victory the Romans could afford to wait the course of events. Scipio had been victorious in Spain, and early in 204 B.C. he was allowed to cross into Africa. Soon it was clear that he would threaten Carthage more effectively than Hannibal had ever threatened Rome. He received the order of recall at Crotona, and thence embarked for Africa. He landed at the smaller Leptis, on the coast of Tunis, late in the year 203 B.C., and lingered during the winter at Hadrumetum, the modern Susa. His brothers Hasdrubal and Mago had both fallen, and he was now the last of the "lion's brood." Fugitive as he was, his presence roused the Carthaginian spirit. The people would not hear of peace. Hannibal indeed attempted to negotiate, and had an interview with Scipio, but in vain. When he saw that he must fight, he could not have felt any of his old confidence. He had some good troops, but he was numerically inferior to the enemy. Of his veterans

but few could have remained. The armies at last met at Zama, somewhere near the modern Keff. The battle was obstinately contested, and Hannibal's old soldiers died fighting in their ranks. But he never really had a chance of victory. Many of his men were raw mercenaries, and some of them deserted to the enemy. His army was utterly discomfited, and indeed annihilated. The defeat was not discreditable to him, but it was decisive. With a handful of men he escaped to Hadrumetum, and in the year 202 B.C. the Second Punic War, more properly, the Hannibalian War was at an end.

He was still only in his forty-sixth year. He soon showed that he could be a statesman as well as a soldier. Peace having been concluded, he was appointed chief magistrate of the state. The office had become rather insignificant, but Hannibal restored its power and authority. The oligarchy, always jealous of him, had even charged him with having betrayed the interests of his country while in Italy, and neglected to take Rome when he might have done so. The dishonesty and incompetence of these men had brought the finances of Carthage into grievous disorder. So effectively did Hannibal reform abuses that the heavy tribute imposed by Rome could be paid by instalments without additional and extraordinary taxation. Carthage grew prosperous, and again the Romans trembled. Seven years after the victory of Zama they demanded Hannibal's surrender. They were still in mortal dread of their old enemy. Hannibal did not wish his countrymen to disgrace themselves, and he therefore at once became an exile. First he went to Tyre, the mother-city of Carthage, and thence to Ephesus, where he was honourably received by Antiochus, king of Syria, who was then preparing for war with Rome. Hannibal soon saw that the king's army was no match for the Romans. He advised him to equip a fleet and throw a body of troops on the south of Italy, adding that he would himself take the command. But he could not make much impression on Antiochus, who was a conceited man, quite ignorant of the strength of Rome. The story was told that, pointing to the great army he had assembled at Ephesus, he asked Hannibal if he did not think that these were enough for the Romans. Hannibal's reply was, "Yes, enough for the Romans, however greedy they may be." The great army in which Antiochus had trusted was in 190 B.C. routed by Scipio at Magnesia near Smyrna. Again Rome demanded the surrender of Hannibal.

The end was now at hand. From the court of Antiochus Hannibal fled to Crete, but he soon went back to Asia, and sought refuge with Prusias, king of Bithynia. Once more the Romans were determined to hunt out the old man, and they sent Flamininus to insist on his surrender. Prusias was but a poor paltry princeling, and he promptly complied. Hannibal did not choose to fall into his enemies' hands. At Libyssa, on the eastern shore of the Sea of Marmora, he took poison, which, it was said, he had long carried about with him in a ring. The precise year of his death was a matter of controversy. If, as Livy seems to imply, it was 183 B.C., he died in the same year as his great and victorious antagonist, Scipio Africanus.

As to the transcendent military genius of Hannibal there cannot be two opinions. The man who for fifteen years could hold his ground in a hostile country against several powerful armies and a succession of able generals must have been a commander and a tactician of supreme capacity. Wonderful as his achievements were, we must marvel the more when we take into account the grudging support he received from Carthage. As his veterans melted away, he had to organize fresh levies on the spot. We never hear of a mutiny in his army, composed though it was of Africans, Spaniards, and Gauls. He who could throw a spell

over such rough and various natures must indeed have been an extraordinary man. Again, all we know of him comes for the most part from hostile sources. The Romans feared and hated him so much that they could not do him justice. Long after the peril had passed away, we may well believe that Horace accurately reflected their sentiment in describing him, as he does more than once, as the *divus Hannibal*. Livy speaks of his great qualities, but he adds that his vices were equally great, among which he singles out his "more than Punic perfidy" and "an inhuman cruelty." For the first there would seem to be no further justification than that he was consummately skilful in the use of ambuscades. For the latter there is, we believe, no more ground than that at certain crises he acted in the general spirit of ancient warfare. Sometimes he contrasts most favourably with his enemy. No such brutality stains his name as that perpetrated by Claudius Nero on the vanquished Hasdrubal. Polybius merely says that he was accused of cruelty by the Romans and of avarice by the Carthaginians. He had indeed bitter enemies, and his life was one continuous struggle against destiny. For steadfastness of purpose, for organizing capacity and a mastery of military science, he has perhaps never had an equal.

Considering his fame, we should have expected to find a number of anecdotes about him. There are, however, only a few. One is given by Cicero (*De Oratore*, ii. 18); and may fairly find a place here. When he was an exile at Ephesus, he was invited to hear a lecture from one Phormio, a philosopher. The lecturer discoursed on things in general and on the duties of a commander-in-chief in particular, and was warmly applauded by his audience. Some of the hearers turned to Hannibal and asked him what he thought of it. "I have seen," said he, "plenty of old fools in my time, but this man beats them all."

Our chief sources for the life of Hannibal are Polybius and Livy. With Polybius we are generally on safe ground, but unfortunately we have not his guidance throughout. Livy's narrative is too much devoted to his country to be impartial; but he is minute, and his entire history of the Second Punic War has come down to us. There are besides the meagre epitomes of Florus and Orosius, and the remains of the abridgment of Dion Cassius by Zonaras. We have also Plutarch's lives of Fabius Maximus and Marcellus, in which of course Hannibal figures conspicuously, and a life by Cornelius Nepos. To these must be added Appian, whose book on the *Wars of Hannibal* is not without some value. (W. J. B.)

HANNIBAL, a city of the United States, in Marion county, Missouri, is situated on the west bank of the Mississippi river, 150 miles above St. Louis. Owing to its position on the river and its extensive railroad connexions, it has become a busy commercial town; and evidence of the prosperity of many of its inhabitants is afforded by the number of fine residences on the surrounding slopes. It possesses a city hall, a Roman Catholic seminary, and a high school. The river is crossed by a splendid iron bridge, which has provision both for ordinary and for railway traffic. The principal shipping trade is in lumber with other parts of the State, as well as with Kansas and Texas; but tobacco, pork, and flour are also extensively shipped. The manufactories include foundries, car-works, machine-shops, tobacco-works, beef-curing establishments, and flour-mills. In the neighbourhood there are lime-works and coal-pits. The population, which in 1860 was 6505, and in 1870 was 10,125, of whom 1616 were coloured and 1632 foreigners, is now (1880) estimated at 15,000.

HANNO (a very common Carthaginian name, Greek Ἰάννης), according to the title of the *Periplus* that passes under the name, was a king (basileus) of the Carthaginians who undertook an exploring and colonizing expedition along the north-western coasts of Africa beyond the Pillars of Hercules, and on his return inscribed a narrative of his voyage in the temple of Saturn. There are no data to fix with any precision the time at which he flour-

ished, the most definite statement about the matter being Pliny's "Punicis rebus florentissimis." Bougainville and Vivien de Saint Martin are disposed to assign him to circa 570 B.C.; Heeren, Kluge, and others make him contemporary with a Hanno, father of Hamilcar (c. 510 B.C.); and Müller thinks he may be possibly identified with Hanno the son of Hamilcar (c. 470 B.C.). According to the *Periplus*, which is the only detailed notice of the expedition that has come down to us, he sailed with sixty galleys (*pentecontoroi*) and 30,000 (l) men and women, and in the course of his voyage south founded the city of Thymiaterium and settled colonies at Gytté, Acra, Melitta, Aramby, and in the island of Cerne or Kerne. The terminus of the voyage was an island beyond a gulf called the Noti Cornu, in which they found a number of "hairy women" whom the interpreters named *gorillas*.

The identification of the various points mentioned in the narrative has given scope to abundant dissertation and conjecture, and the question as to the site of the gorilla island, or southmost limit of the exploration, has been discussed with special interest. Bougainville and Dureau de la Malle maintain that Hanno reached the Bight of Benin; Müller and Vivien de Saint Martin find his *ultima Thule* in the Gulf of Sherboro; Mannert decides in favour of Bissagos, Heeren for the mouth of the Gambia, Malte Brun for the Bay of Cintra, and Quatrenière for the neighbourhood of the Senegal, while Gosselin would go no further south than Cape Nun. But while authorities differ so much in the matter of identification, almost all agree that the narrative is one of the most remarkable records of early exploration that have been preserved. "In its original form," says Vivien de Saint Martin, "it was only a commemorative inscription of barely a hundred lines, and yet in spite of this extreme conciseness there is not one of its details, whether of localities or distances, which is not rigorously conformable to the very accurate acquaintance which we now have of these coasts." In the 18th century Dodwell called the authenticity of the *Periplus* in question, but it was considered that his arguments had been disposed of by Falconer and others. Recently, however, M. Tauxier has renewed the attack, maintaining that in reality we have nothing before us but "a compilation due to an ignorant Greek of the 1st century B.C., brought to its present form by some Christian of the time of Theodosius, probably a student to whom the task was assigned of adapting the old *Periplus* to the geographical ideas of the day."

The editio princeps of the *Periplus* of Hanno issued from the press of Frobenius at Basel in 1533 (Ἀρριανῶν περιπλοῦς, κ.τ.λ.; Ἀναγνώσις περιπλοῦς Ἰάννου, κ.τ.λ.). Of more recent editions it is enough to mention that in Hudson's *Geographical writers scriptores Græci minores*, vol. 1, Oxford, 1698, with Dodwell's disquisitions prefixed; Arnold Schmidt, *Arrians Jüdische Merkwürdigkeiten und Hannons Seereise*, Brunswick and Wolfenbüttel, 1764; Thomas Falconer, *The Voyage of Hanno translated . . . and defended against the objections of Mr. Dodwell*, London, 1797; Kluge, *Hannonis Navigatio*, Leipzig, 1829; and Carl Müller, *Geographi Græci Minores*, Paris, 1855. For further details see Müller's *Prolegomena*; Bougainville in *Acad. des Inscri.*, et *Belles Lettres*, tome xxvi.; Vivien de Saint Martin, *Le Nord de l'Afrique dans l'Antiquité*, Paris, 1863; Dr. Judas in *La Reine d'Orient*; and M. Tauxier in *La Globe*, Geneva, 1867, and *Comptes Re. des de l'Acad. des Inscri.*, Paris, 1875.

HANNO, the chief opponent of Hamilcar and Hannibal at Carthage. Few details are known of his life; his influence on the history of his country, which for more than forty years was very great, can be appreciated only from a detailed history of the period. During the First Punic War he conducted successfully a campaign against some African nation, and he soon became the most trusted leader of the aristocratic party. When in 240 B.C. Hamilcar's veterans returned from Sicily, clamouring for their promised pay, Hanno was sent to require them to accept partial payment; and on their rebellion he was appointed to the command against them. His unpopularity with the army and his incapacity led to several defeats, and the Government was reluctantly forced to associate Hamilcar with him. After Hamilcar had at length crushed the rebellion, Hanno seems to have remained at Carthage exerting all his influence against the democratic party. During the Second Punic War he advocated peace with Rome; and he even, according to Livy (xxiii. 13), advised that Hannibal should be given up to the Romans. After the battle of Zama (203 B.C.) he was one of the ambassadors sent to Scipio to sue for peace, and after the war he is mentioned among the leaders of the Roman party.

HANOVER (German, *Hannover*), formerly an independent kingdom, but since 1866 a province of Prussia, lies between 51° 18' and 53° 52' N. lat. and 6° 43' and 11° 45' E. long, and is bounded on the N. by the North Sea, N.E. by Holstein, Hamburg, and Mecklenburg, E. and S.E. by Prussian Saxony and the duchy of Brunswick, S.W. by Hesse-Cassel and Westphalia, and W. by Holland. These boundaries include the grand-duchy of Oldenburg, which stretches southward from the North Sea nearly to the southern boundary of Hanover. A small portion of the province in the south is separated from Hanover proper by the interposition of a part of Brunswick. The area of the province extends to 14,548 English square miles.

Physical Features.—The greater part of Hanover is embraced in that extensive plain which, commencing on the shores of the North Sea, terminates on the frontiers of Russia. The most fruitful districts are on the banks of the Elbe and near the North Sea, where, as in Holland, rich meadows are preserved from being immersed in water by broad dykes and deep ditches, constructed and kept in repair at great expense. It is only the southern portion that is mountainous; the district of Klausthal, containing the Harz, is wholly so, as well as some parts near Göttingen, and in the district of Hildesheim. The Harz mountains are not a part of any chain, but rise from a plain in an isolated group, the highest points of which are nearly in the centre (see HARZ). They are covered with extensive forests. On their lower slopes the trees are of the deciduous kinds, but pines alone are found on the summits.

The whole of Hanover dips towards the north, and the rivers consequently flow in that direction. The Elbe, which forms the boundary on the N.E., receives the following tributaries:—the Ohre, which rises in the district of Lüneburg; the Aland and the Jetze, which come out of the province of Saxony, and are navigable in their lower course; the Ilmenau, which becomes navigable at Lüneburg; the Este, navigable to Buxtehude; the Lüche, navigable to Hornburg; the Schwinge, by which vessels reach Stade; the Oste, navigable to Kirchstors; and the Medem, which runs through the Hadeln-land, and admits large vessels up to Otterndorf. The Weser enters Hanover at Münden, being there formed by the junction of the Fulda and the Werra. It is navigable for barges from the spot at which its name commences; and it receives the Hamel, the Aller, the Oertze, the Leine, the Bohme, the Eyther, the Wümme, which in the lower part of its course takes the name of Lesum, the Geeste, and the Hunte,—all of them purely Hanoverian rivers. The Ems rises in the province of Westphalia, and after entering Hanover receives the waters of the Aa, the Haase, the Else, and the Leda; it falls into the Dollart near Emden, which is the principal seaport in the kingdom. It is navigable for flat-bottomed vessels from Rheina downwards, and for sea-going ships from Halte and Weener. The Vecht, a river of short course, rises in the province of Westphalia, and falls into the Zuyder Zee. A navigable canal from the Vecht to Münster connects that city with the Zuyder Zee. Navigable canals connect the various river systems.

The principal lakes are the Steinhuder Meer, about 4 miles long and 2 broad, and 20 fathoms deep, on the borders of Schaumburg-Lippe; the Dümmersee on the borders of Oldenburg, about 12 miles in circuit; the lake of Bederkesa, and some others in the moorlands of the north; the Seeburger See near Duderstadt; and the Oderteich, in the Harz, 2100 feet above the level of the sea.

Climate.—The climate in the low-lying districts near the coast is moist and foggy, in the plains mild, on the Harz mountains severe and variable. In spring the prevailing

winds blow from the N.E. and E., in summer from the S.W. The mean annual temperature is about 46° Fahr.; in the town of Hanover it is higher. The average annual rainfall is about 23·5 inches; but this varies greatly in different districts. In the west the Höhenrauch, a thick fog arising from the burning of the moors, is a plague of frequent occurrence.

Agriculture.—Though agriculture constitutes the most important branch of industry in the province, it is still in a very backward state. The greater part of the soil is of inferior quality, and much that is susceptible of cultivation is still lying waste. Of the entire area of the country 28·2 per cent. is arable, 16·6 in meadow or pasture land, 13 per cent. in forests, 37·2 per cent. in uncultivated moors, heaths, &c.; from 17 to 18 per cent. is in possession of the state. The best agriculture is to be found in the districts of Hildesheim, Calenberg, Göttingen, and Grubenhagen, on the banks of the Weser and Elbe, and in East Friesland. Of the whole area under cultivation in 1878 there was under wheat 1·9 per cent.; rye, 10·9; barley, 0·9; oats, 5·7; buckwheat, 1·4; pease, 0·4; potatoes, 2·8; and meadow, 10·4 per cent. The extent of tillage was 3,295,752 acres of a total area of 9,464,446 acres. The total yield for the season 1878 was—wheat, 2,298,543 cwt.; rye, 10,843,726 cwt.; barley, 1,350,417 cwt.; oats, 7,054,389 cwt.; buckwheat, 1,150,515 cwt.; pease, 348,934 cwt.; potatoes, 17,828,490 cwt.; hay, 34,238,480 cwt. Rye is generally grown for bread. Flax, for which much of the soil is admirably adapted, is extensively cultivated, and forms an important article of export, chiefly, however, in the form of yarn. Hemp, turnips, and hops are also among the exports. There were in 1877 805 acres planted with tobacco, the produce of which was 12,207 cwt., valued at £15,150. Of beet there were 27,700 acres, yielding 5,376,480 cwt. of beet-root, from which was manufactured in 27 sugar-mills with 211 engines of 2433 horse-power 581,707 cwt. of raw sugar. Apples, pears, plums, and cherries are the principal kinds of fruit grown. Red bilberries (*Vaccinium Vitis idæa*) from the Harz and black bilberries (*V. Myrtillus*) from the Lüneburg Heath form an important article of export.

Live Stock.—By the returns of 1873 there were in Hanover 191,006 horses, 132 mules, 404 asses, 894,153 head of horned cattle, 1,856,962 sheep (including 511,892 heidschnucken, a very coarse breed), 510,550 pigs, 172,902 goats, and 217,045 beehives. Bees are principally kept on the Lüneburg Heath. The number of sheep was larger before 1867, but the number of horned cattle has increased. Horses are reared in the marshes of Aurich and Stade, in Hildesheim and Hanover; the cattle of Aurich (East Friesland) are famous for their size and quality. The best sheep belong to the country lying between the capital and the Harz. Large flocks of geese are kept in the moist lowlands; their flesh is salted for domestic consumption during the winter, and their feathers are prepared for sale.

Mining.—Minerals occur in great variety and abundance. The Harz mountains are rich in silver, lead, iron, and copper; coal is found around Osabrück, on the Deister, at Osterwald, &c., lignite in various places; salt-springs of great richness exist at Egestorf, Ball and Neuhall near Hanover, and at Lüneburg; and petroleum may be obtained south of Celle. In the cold regions of the northern lowlands, peat occurs in beds of immense thickness. The mining returns for the year 1878 give the following quantities and values:—coal, 301,728 tons (£118,765); lignite, 126,714 tons (£33,724); asphalt, 26,000 tons (£28,000); iron ores, 170,969 tons (£16,000); zinc, 5141 tons (£16,944); lead ore, 32,866 tons (£188,785); copper ore, 16,793 tons (£45,286); silver ore, 35 cwt. (£1420); manganese ore, 3070 cwt. (£719); salt from springs, 73,007 tons (£91,493).

Manufactures.—Works for the manufacture of iron, copper, brass, wire, silver, lead, vitriol, and sulphur are carried on to a large extent. About 40,000 persons are employed in these works and in the mines, the yearly revenue from which amounts to £1,200,000. The production of 1878 consisted of—iron, 1,562,231 tons; lead, 8774 tons; copper, 2556 cwt.; silver, 53,932 lb; gold, 171 lb; sulphuric acid, 573 tons; blue vitriol, 788 tons. The iron works are very important; smelting is carried on in the Harz and near Osabrück; there are extensive foundries and machine factories at Hanover, Linden, Osabrück, Hameln, Geestemünde, Harburg, Osterode, &c., and manufactories of arms at Herzberg, and of cutlery in the towns of the Harz and in the Sollinger Forest. The textile industries are presented chiefly in the towns. Linen yarn and cloth are largely manufactured, especially in the south about Osabrück and Hildesheim, and bleaching is engaged in extensively; woollen cloths are made to a considerable extent in the south about Einbeck, Göttingen, and Hameln; cotton-spinning and weaving have their principal seats at Hanover and Linden. Glass houses, paper-mills, potteries, tile works, and tobacco-pipe works are numerous. Wax is bleached to a considerable extent, and there are numerous tobacco factories, tanneries, breweries, vinegar works, and brandy distilleries. Shipbuilding is an important in-

dustry, especially at Papenburg, Emden, Leer, Stade, and Harburg; and at Münden river barges are built.

Commerce.—Although the carrying trade of Hanover is to a great extent absorbed by Hamburg and Bremen, the shipping of the province counts 867 sea-going vessels, the larger vessels all belonging to Geestmünde. Emden is destined to become a very important seaport when the extensive harbour improvements have been completed.

Administration.—The province is divided into six landdrosteien or counties, and these again have been subdivided, since the annexation by Prussia, into smaller districts. There is a provincial assembly representing 43 towns and 101 bailiwicks. A court of appeal for the whole province sits at Celle, and there are 12 superior courts. To the German parliament (reichstag) Hanover sends 19 members; to the Prussian house of assembly (abgeordnetenhaus) 36. The debts of the province, contracted before the occupation by Prussia, amount to £226,622.

Population.—The census of 1871 gave the population as 1,963,618; 1,713,664 belonged to the Evangelical Church, 233,633 were Roman Catholics, and 12,790 Jews. The urban population numbered

Counties.	Extent in English sq. miles.	Population, 1st Dec. 1875.			Inhabitants to the sq. mile.
		Males.	Females.	Total.	
Hanover	2197.4	215,364	214,695	430,059	196
Hildesheim ..	1941.7	204,010	209,587	413,597	213
Lüneburg ...	4375.6	194,586	192,128	386,714	88
Stade	2493.7	154,694	153,515	308,209	123
Osnabrück....	2358.6	139,761	138,900	277,761	128
Aurich.....	1181.0	99,310	101,743	201,053	170
	14548.0	1,007,725	1,009,668	2,017,393	139

503,102, and the rural 1,454,587. By the census of 1875 the population had reached 2,017,393. There are 114 towns, but only 9 have a population exceeding 10,000, viz., Hanover, Osnabrück, Hildesheim, Linden, Harburg, Lüneburg, Celle, Göttingen, and Emden.

Education.—Amongst the educational institutions the university of Göttingen stands first, with an average yearly attendance of 900 students. There are besides 18 gymnasiums, a progymnasium, 9 first-class grammar schools, 11 normal and training schools, a polytechnic school at Hanover, a school of mines and forestry at Klausthal, several naval academies and schools of arts, 3 asylums for the deaf and dumb, 2 for the blind, and numerous other charitable institutions.

History.—The word Hanover originally applied only to the city so called. It was gradually, however, extended to the country of which Hanover was the capital; and it was officially recognized as the name of the state when in 1814 the electorate of Lüneburg was made a kingdom.

In ancient times the country formed part of Saxony, which remained independent until the time of Charlemagne; and afterwards it was included in the duchy of Saxony. After the extinction of the Billing family, which ruled Saxony for about two centuries, the duchy was granted to Lothar of Supplinburg, who in 1125 was elected emperor. He gave his daughter in marriage to Henry the Proud, duke of Bavaria, of the ancient house of Guelf, which already had important allodial possessions in Saxony. Henry the Proud became duke of Saxony as well as of Bavaria; and his son Henry the Lion, after a time of bitter dispute, was installed by Frederick Barbarossa in his father's great position. In the latter part of Frederick's reign, in 1180, Henry was deprived of both his duchies, but was allowed to keep the allodial possessions of his family, viz., Brunswick and Lüneburg. In 1235 these lands were yielded by Henry's grandson, Otto Puer, to the emperor Frederick II., who granted them to him in fief as a duchy. Otto's two sons divided their inheritance into two duchies in 1267, and thus were formed the old Lüneburg and the old Brunswick lines. There was a fresh division in 1428, whereby were formed the so-called middle lines of Brunswick and Lüneburg. From 1527 Lüneburg was under the sole government of Duke Ernest the Confessor, who was an ardent adherent of Luther, and so persistently laboured to promote the Reformation in his country that it has been essentially Protestant ever since. He died in the same year as his friend Luther, 1546; and from him descended the younger lines of Brunswick and Lüneburg, or of Brunswick-Wolfenbüttel and Brunswick-Lüneburg. For in 1631 Duke Frederick Ulrich of Brunswick-Wolfenbüttel suddenly died childless, and his duchy was inherited by Augustus the younger, the descendant of Ernest's eldest son Henry; and Brunswick has remained in the hands of this dynasty till the present day. Meanwhile Lüneburg had been ruled over by William, the younger son of Ernest the Confessor; and when he died in 1592 he left seven sons, of whom four, Ernest, Christian, Augustus the elder, and Frederick, one after the other, became rulers of the land. Frederick, who survived all his brothers, died in 1648, the year in which the Thirty Years' War was brought to a close. The

only one of the seven brothers who married was George, to whom was granted as a separate duchy a part of Lüneburg called Calenberg, of which he made Hanover the capital, Celle being the capital of Lüneburg. He arranged that his eldest son should be allowed to select either Calenberg or Lüneburg, that the second should take the duchy not chosen by his brother, and that the remaining sons should be content without having territory to govern. The result of this settlement was that his eldest son, Christian Louis, chose Lüneburg, where he ruled till his death in 1665. George William, the second son, ruled over Calenberg till 1665, when he transferred himself to Lüneburg, which he governed till 1705. On his going to Lüneburg, the third brother, John Frederick, became duke of Calenberg, in which position he was succeeded in 1679 by Ernest Augustus, the fourth brother, who married Sophia the granddaughter of James I. of England. Ernest Augustus was an exceedingly ambitious prince, and in order to increase the power of his country introduced in 1682 the law of primogeniture. Afterwards, in 1692, in consequence of a vast amount of negotiation and intrigue, he managed to secure for himself and his successors the electoral title. He died in 1698, and was succeeded by his son George Louis, who, having married his cousin Sophia Dorothea, the daughter of George William of Calenberg, finally united the two duchies on the death of the latter prince. In 1714 George Louis, the elector of Lüneburg, ascended the throne of Great Britain as George I.

After this time, until the death of William IV., Lüneburg or Hanover had the same sovereign as Great Britain; and this personal union of the two countries was not without important results for both. George II., as the ally of Frederick the Great in the Seven Years' War, joined the struggle in the capacity both of elector and of king; and while George III. was on the throne there was hardly a phase of the foreign policy of England by which Hanover was not affected. In 1803, when the Hanoverian troops capitulated at Sulingen, the country was invested by a French corps, which it had to maintain at a heavy cost. The Prussians received temporary possession of Hanover from Napoleon in 1806; but in 1807 a part of it was annexed to the kingdom of Westphalia, to which the remaining portion was added in 1810. The people never acquiesced in French predominance, and when the final struggle with Napoleon came they distinguished themselves by the ardour with which they flung themselves into it. At the congress of Vienna in 1815 it was demanded in the name of the elector (King George III.) that the electorate should be recognized as a kingdom; and not only was the demand admitted, but the new kingdom received considerable accessions of territory.

Partly through the influence of the French, partly in consequence of the general progress of ideas, Hanover was now, like many other parts of Germany, penetrated by a desire for freedom; and such had been the sufferings of the people, willingly borne for their sovereign and country, that they felt they had a right to be treated in a conciliatory and generous spirit. Their wishes were, however, disregarded. Count Münster, who virtually ruled the country from London, drew up a constitution which came into force in 1819. It was thoroughly reactionary in tendency, and the more resolutely it was enforced the more completely were the people alienated from the ruling class. Not until 1831, when there were several popular risings of so serious a nature that Count Münster resigned, was it deemed necessary to make important concessions, and even then the constitution which the states assembly prepared was made considerably less liberal by William IV. before he sanctioned it in 1833.

As the law of Hanover prevented a woman from mounting the throne, Ernest Augustus, duke of Cumberland, became king after the death of William IV. in 1837. He proved to be a harsh and narrow-minded despot. In 1837 he arbitrarily abolished the constitution of 1833, and when seven professors of the university of Göttingen protested against the act as unlawful, they were deprived of their chairs, and three of the most distinguished—Gervinus, Jacob Grimm, and Dahlmann—were banished from the country. The people were profoundly stirred, and it was hoped that the confederate diet might be induced to protect their rights, but it declined to interfere. A pitiful imitation of a constitution was granted in 1840, but this only intensified the public indignation, which became so strong that in 1848 the revolutionary movement which swept over Europe seemed about to overthrow King Ernest Augustus and his throne together. By hasty concessions he succeeded in preventing this catastrophe, but no sooner did the agitation begin to abate than he showed a disposition to evade the obligations imposed by the constitution which had been wrung from him. The comparatively liberal ministry which had been appointed in the moment of danger was dismissed in 1850, and probably only the death of the king in 1851 prevented him from engaging in as serious a contest as ever with the progressive forces that surrounded him. In 1849, when the Frankfort diet failed to establish the unity of Germany, he joined the kings of Prussia and Saxony in forming what was called "the three kings' alliance"; but he soon withdrew from this connexion, and associated himself with the thoroughly conservative policy of Austria.

Ernest Augustus was succeeded by his blind son, George V. Personally King George was of an amiable disposition, but he shared his father's extravagant conceptions of royal rights, and at once appointed a ministry whose aim was to get rid of the inconvenient constitution of 1848. The second chamber, however, resisted its designs so energetically that in 1852 the more reactionary ministers had to resign, and in 1853 even the modified cabinet was completely defeated. The king then created a Government which advised him to appeal to the confederate diet. This was done, and in 1855 the diet proclaimed the constitution of 1848 to be invalid. That a more easy triumph might be secured, the states assembly was dissolved, and a ministry was formed which boldly restored the nominal constitution of 1840. This Government spared no effort to obtain an overpowering majority, but, as it still encountered some resistance in the new parliament, fresh elections were ordered, and in 1857 it had the satisfaction of meeting as pliant a body of deputies as the king himself could wish. The people, however, were not in sympathy with their nominal representatives, and gave many proofs of their discontent with the arbitrary rule to which they were subjected. In 1862, when an attempt was made to impose upon the schools the use of a catechism of the 17th century, the popular feeling was so decisively expressed that the king was compelled to dismiss his ministers. The new cabinet, which was rather less extravagant, included Herr Windthorst, who had for a short time had a seat in the Government that resigned in 1853, and who has since acquired distinction as leader of the Ultramontane party in the imperial parliament of Germany. King George could not long submit even to a slight modification of his absolutist notions, and in 1865 entrusted Herr von Borries, who had done him faithful service in previous administrations, with the task of bringing together a cabinet to his liking.

Meanwhile, however, dangers had arisen in Germany, compared with which the internal troubles of Hanover were of small account. Herr von Bismarck, who now controlled Prussian policy, was devising methods for the realization of his vast schemes; and it became increasingly clear, after the Schleswig-Holstein war, that the minor states of Germany would soon have to accept finally the lead either of Prussia or of Austria. Before the outbreak of that conflict Hanover and Saxony had despatched troops to Holstein for the purpose of executing the will of the bund. Although the federal army was driven back by Prussia, Hanover seemed for a time to be favourable to her rather than to Austria; but in reality the sympathy of the court was altogether with the latter power. On the 14th of June 1866, in regard to the decisive question whether the federal army should be mobilized, Hanover voted in the confederate diet with Austria; and by doing so she irrevocably declared on which side she would range herself in the approaching struggle. In consequence of this vote Prussia addressed an ultimatum to Hanover on the 15th of June, requiring her to maintain unarmed neutrality and to accept the scheme for the reform of the confederation which the Prussian plenipotentiary had submitted to the diet before retiring from it. As Hanover rejected these demands, Prussian troops at once crossed the frontier; and on the 17th of June they were in possession of the capital. On the 27th a battle was fought at Langensalza, in which the Hanoverians were victorious; but they could make no use of their victory, and were soon compelled to capitulate. At the conclusion of the war, by the treaty of Prague, Hanover, with Hesse, Nassau, and Frankfurt, was annexed to Prussia. King George addressed from Hietzing, near Vienna, a protest to the European cabinets, but it was disregarded; on the 3d of October 1866, his dominions were formally taken possession of, and in the following year the population were subjected to the Prussian constitution. In 1878 George V. died at Hietzing, but his son, Ernest Augustus, duke of Cumberland, maintains his right to the crown; and there is still a party in Hanover which expresses itself favourable to his claims. The mass of the population, however, whether originally willing to be annexed to Prussia or not, have submitted to the inevitable, and there is evidence that they are gradually becoming loyal subjects of the Prussian king.

HANOVER, the capital, is situated in the south of the above province, on a sandy but fertile plain on the river Leine, which here receives the Ihme, and is from this point navigable to the Weser. It is 38 miles W. by N. of Brunswick by rail, 157 miles W. of Berlin, 78 S.E. of Bremen, and 107 S. of Hamburg. The Leine flows through the town having the old town on its right bank, and the Calenberger new town between its left bank and the Ihme. The old town is irregularly built, with narrow streets and old-fashioned houses; while the new town has wide streets, handsome buildings, and beautiful squares. Of the latter the most remarkable are—the square at the railway terminus, with an equestrian statue of King Ernest

Augustus in bronze; the triangular theatre square; George Square, with the statue of Schiller; Waterloo Square, with a column 99 feet high, surmounted by Victory, and having inscribed on it the names of 800 Hanoverians who fell at Waterloo. In the gardens near the square an open rotunda has been erected enclosing a marble bust of Leibnitz, and near it a monument of General Alten, commander of the Hanoverian troops at Waterloo. The town has numerous churches; in the chapel of the palace are preserved the relics of saints which Henry the Lion brought from Palestine. The royal palace—built 1636-1640, rebuilt 1837—contains a picture gallery and collection of natural curiosities, and the palace of Ernest Augustus is remarkable for its historic collections, especially the famous Welfen museum. The other principal public buildings are the record office, containing a library of 150,000 volumes; the town-hall, built in the 15th century; the theatre, the museum, the aquarium, the handsome railway terminus, and the exchange. Hanover has a number of colleges and schools, and is the seat of several learned societies. During the last ten years the town has become the seat of various new industries and of an increasing trade. It is connected by rail

Plan of Hanover.

with Berlin, Harburg, Bremen, Hameln, Cologne, Altenbeken, and Cassel; and the annual fairs for cloth, leather, yarns, linen, wool, &c., are frequented by large numbers of buyers. There are several banks and a chamber of commerce. Almost every industry is at present represented, whilst in former times the inhabitants derived their chief support from the presence of the court and the nobility. The town possesses large cotton-mills, iron-foundries, and machine factories, numerous tobacco manufactories, breweries, distilleries, &c. Hanover was the first German town that was lighted with gas. It is the birthplace of Sir William Herschel the astronomer (1822), of the brothers Schlegel, and of the historian Pertz; and the philosopher Leibnitz died there (1716). The population has increased from 49,909 (including suburbs) in 1852 to 106,677 in 1879 (with the adjoining Linden, 127,576). In the vicinity are the royal palaces of Herrenhausen, the unfinished Welfenschloss (formerly Mont Brilliant), and Marienburg, the private property of Queen Marie, all surrounded by gardens.

(E. J.—J. St.)

HANSARD, LUKE (1752-1828), English printer, whose name is familiar in connexion with the parliamentary reports, was born July 5, 1752, in St Mary's parish, Norwich. Reverses in business compelled his father, a manufacturer there, to apprentice him to Mr Stephen White, printer. Immediately on the expiry of his apprenticeship Hansard started for London with only a guinea in his pocket, and obtained there in 1772 a situation as compositor in the office of Mr Hughs, printer to the House of Commons. There his ability and energy commended him so well to his master that in two years' time he was made a partner, and undertook almost the entire conduct of the business, which in 1800 was resigned completely into his hands, through the retirement of Mr Hughs. Among those whose acquaintance Hansard made in the exercise of his profession and retained by his amiable private qualities, were Orme, Burke, and Dr Johnson; while Porson eulogized him as the most accurate printer of Greek. The promptitude and accuracy with which Hansard printed parliamentary papers were often of the greatest service to Government.—notably on one occasion when the proof-sheets of the report of the Secret Committee on the French Revolution were submitted to Pitt twenty-four hours after the draft had left his hands. On the union with Ireland in 1801, the increase of parliamentary printing was so great that Hansard was forced to give up all private printing except when parliament was not sitting. He devised numerous expedients for reducing the expense of publishing the reports; and in 1805, when his workmen struck at a time of great pressure, he and his sons did not scruple themselves to work as compositors, and to instruct the new hands they had procured. Shortly after printing the report of the session that rose in July 1828, Hansard's health, which had been failing, completely gave way, and he died on October 29th of the same year. See the *Gentleman's Magazine* for December 1828.

HANSEATIC LEAGUE. The word "hansa," when we find it first in the Gothic Bible of Ulfla, signifies a military assemblage or troop. From this comes the general sense of union, and especially in the Middle Ages of union for mercantile purposes. A later but less important meaning is that of a tax paid by traders for the right of forming such an union.

The Hansa, the league which ultimately overshadowed all rivals and usurped the name for itself, was no intentional creation, and we can fix no exact date for its origin. It arose gradually from two elements, the union of German merchants abroad, and the union of German towns at home.

The first impulse to mercantile union came from the dangers of travelling in the early Middle Ages. In those days mariners had neither chart nor compass to guide their course, and were forced to creep timidly along the shore and to avoid as much as possible the open sea. The merchant had also to dread more positive dangers than those of storm and wreck. The coasts of northern Germany harboured numbers of rovers and pirates, who regarded the peaceful trader as their natural prey. To increase their powers of resistance, it was usual for merchants to undertake their voyages in more or less numerous companies. The union thus begun on sea was still further cemented

on land. In those days law was personal and not territorial. The foreign merchant had no share in the law of the land where he sojourned; he brought with him his own law, and administered it as best he could. The legal customs of northern Germany were substantially alike; and this similarity strengthened the bonds of union among the merchants who found themselves for a time settled in a foreign land. Moreover, the state of trade frequently required a long stay, and sometimes a depositing of goods among strangers. This led in time to the acquisition of common possessions abroad, lodgings, storehouses, &c. This common depot, or "factory," became the central point of the union or Hansa formed by the merchants. The union soon received a corporative constitution. At its head stood the elders, whose chief functions were to administer justice and to represent the society in its relations to the natives of the country. It was by means of these orderly unions that the German merchants obtained their important privileges, chiefly advantages in trade and taxes, from the people among whom they sojourned.

The most important German mercantile settlements were founded in Wisby, the capital of Gothland, in London, Novgorod, Bergen, and Bruges. Wisby was the central point of the Baltic trade; the other towns represent the four extreme points of North-German commerce. It was not unnatural that the mercantile settlements should exercise great influence on the towns from which they sprang. In those towns the municipal government was wholly in the hands of merchants. There was no feudal aristocracy as in the Italian cities, and the artisan was always jealously excluded from political power. It is obvious therefore that the policy of the town-councils would often be influenced by the exigencies of foreign commerce. But the influence of the foreign factories was not exercised by all in an equal degree. Wisby differed from the other settlements in the fact that the Germans there were not merchants making a temporary visit, but were real settlers living side by side with the native population. Novgorod was a mere colony of the German settlement in Wisby, and never held an independent position. Bergen was comparatively unimportant, and the German "counter" in Bruges was not formed until some amount of union had been attained at home. But in the German colony in London the majority of the members were merely passing traders, who remained citizens of their native towns. It was therefore the London Hansa which exercised the greatest influence on the growth of the town league.

In the reign of Edgar we find the "people of the emperor" occupying a prominent position in London trade, and joined in a lasting league. The members of this league came mostly from Cologne, the first German town which obtained great importance both at home and abroad. Its citizens possessed at an early date a guild-hall of their own, and all Germans who wished to trade with England had to join their guild. This soon included merchants from Dortmund, Soest, and Münster, in Westphalia; from Utrecht, Stavert, and Groningen, in the Netherlands; and from Bremen and Hamburg on the North Sea. But when, at the beginning of the 13th century, the rapidly rising town of Lübeck wished to be admitted into the guild, every effort was made to keep her out. The intervention of the emperor Frederick II. was powerless to overcome the dread felt by Cologne towards a possible rival to its supremacy. But this obstacle to the extension of the league was soon overcome. In 1260 a charter of Henry III. assured protection to all German merchants. A few years later Hamburg and Lübeck were allowed to form their own guilds. The Hansa of Cologne, which had long been the only guild, now sinks to the position of a branch Hansa, and has to endure others with equal privileges. Over all the

branch Hansas rises the "Hansa Alamannia," first mentioned in 1232.

The opposition to the exclusive pretensions of Cologne was chiefly the work of Lübeck, and with the rise of Lübeck we must connect the second element, the internal political element, which contributed to the formation of the Hansa. The old capitals of German trade, Cologne and Wisby, took their stand on the unions of German merchants abroad. In opposition to them Lübeck found support in home alliances, in its league with Hamburg and with the Wendish towns. The alliance between Lübeck and Hamburg is generally and with some truth given as the origin of the Hanseatic League. It was well fitted to play this part. These two towns commanded the commerce of the North Sea and the Baltic. By taking the land route between them, a merchant could avoid the dangerous passage of the Sound or the Belts, and could evade the Sound dues which were often exacted by the Danish kings. The first alliance between the two towns, for which there is no exact date, had for its object the defence of the roads between them. From that came agreements as to mutual legal security, and thence they advanced to common political action in London and in Flanders.

The league between Lübeck and Hamburg was not the only, and possibly not the first, league among the German towns. But it gradually absorbed all the others. Besides the influence of foreign commercial interests there were other motives which compelled the towns to union. The chief of these were the protection of commercial routes both by sea and land, and the vindication of town independence as opposed to the claims of the landed aristocracy. The first to join this league were the Wendish towns to the east, Wismar, Rostock, Stralsund, &c., which had always been intimately connected with Lübeck, and were united by a common system of law known as the "Lübisches Recht." The Saxon and Westphalian towns had long possessed a league among themselves; they also joined themselves to Lübeck. Lübeck now became the most important town in Germany. It had already surpassed Cologne both in London and Bruges. It soon gained a similar victory over Wisby. At a great convention in which twenty-four towns from Cologne to Revel took part it was decided that appeals from Novgorod which had hitherto been decided at Wisby should henceforth be brought to Lübeck.

In the 14th century the Hansa changes from a union of merchants abroad to a league of towns at home. In 1330 mention is first made of the Hanse towns, where before it had been the Hanse merchants. In 1343 the league is first designated as the Hansa by a foreign prince, Magnus of Norway, and thus acquires a diplomatic position as a united state. In 1356 a statute about mercantile privileges at Bruges is made, not by the German merchants, but by the towns themselves, through their representatives assembled at Bruges. Henceforth the town-league subordinates to itself the mercantile unions; the factories and depôts of the merchants lose their independence, and became the "counters," as they are called, of the Hanse towns.

The league thus formed would scarcely have held long together or displayed any real federal unity but for the pressure of external dangers. The true function of the Hansa, and especially of the Baltic towns, was to conduct the commerce between the east and west of northern Europe. But the geographical position of the Scandinavian countries enabled them to interpose a bar to this commerce. Thus from an early period the Hansa stood in a position of watchful hostility towards those countries. It was the careful maintenance of this watch over the Baltic which gave Lübeck its position in the league, and which gave

the League its political as contrasted with its mercantile character.

The most dangerous of the Scandinavian countries at this time was Denmark. Until the 16th century the southern coast of what is now Sweden was in the hands of the Danes, who were thus enabled to command the important channel of the Sound, and to interfere with the herring fisheries, a great source of wealth to the Hanse merchants. The Danish kings were almost always opposed to German interests, and were especially jealous of the supremacy of German traders in the Baltic. Eric Menved (1286-1319) almost succeeded in making himself master of the southern coast of the Baltic. He captured Rostock and the island of Rügen. Even Lübeck submitted to him, and was for a time practically detached from the empire. Stralsund alone successfully resisted the Danish attack. The league of Wendish towns was for the time wholly broken up, and the growth of the Hansa was arrested; but it was saved from total dissolution by the feuds which distracted Denmark. Eric's successor, Christopher II., an exile from Denmark, fled to the very towns which his predecessor had humbled. After extorting from him numerous privileges, especially the exclusive right to the fisheries on the coast of Schonen, the Hanse towns restored him to his throne, though to only a fraction of his former power. From 1333 to 1340 Denmark was without a king, and a prey to the wildest anarchy. But as it recovered strength it again became formidable to the Hansa. Waldemar III. (1340-1377) devoted the early part of his reign to the recovery of the lands which Denmark had lost during the recent troubles. To carry out this policy he had to spend large sums of money, and in his straits he determined to enrich himself by the plunder of German commerce. In 1361 he sailed to Gothland, and surprised and captured the town of Wisby. The news of this act reached the representatives of the Hansa as they were assembled at Grofswald. They at once resolved on war, and in 1362 their fleet stormed and captured Copenhagen. But while they were besieging the strong fortress of Helsingborg, Waldemar attacked their defenceless fleet and destroyed it. This defeat was followed by a truce, which recognized the Danish possession of Gothland. Waldemar might easily have turned this truce into an advantageous peace, but his success seems to have inspired him with the hope of crushing German ascendancy in northern Europe. In 1367 a Hanseatic assembly at Stralsund was informed that Waldemar had laid new duties on the fishing stations, and that he had robbed German merchants in the Sound and the Belts. Another war was inevitable, and this time the result was different. Waldemar did not await the arrival of the hostile fleet, but fled in 1368 to Brandenburg. Denmark fell entirely into the hands of the League. In 1370 Waldemar was compelled, as the price of his return to his kingdom, to sign the treaty of Stralsund. By this treaty the Hansa obtained possession for five years of all fortresses on the coast of Schonen, and as compensation for its losses was to receive for fifteen years two-thirds of the Danish revenues. It was also stipulated that henceforth no king should ascend the throne of Denmark without the consent of the Hanse towns, and that their privileges should be expressly confirmed at each coronation. The treaty of Stralsund marks the zenith of the power and prosperity of the Hansa. The emperor Charles IV., who had always looked coldly on independent combinations among his subjects, seems to have been induced to alter his policy, and in 1375 he distinguished Lübeck by a personal visit.

The war against Waldemar III. seems to have had a great effect in consolidating the Hanseatic League, and in forcing it to adopt a federal constitution. From 1361 we can date the regular meeting of the general assemblies, whose acts (*Recesse*) have been preserved in the archives

at Lübeck. These assemblies met once a year about mid-summer, usually but not exclusively at Lübeck. They were attended by representatives of the various towns, but no one below the rank of councillor could act as representative. The League always endeavoured to maintain its aristocratic character. The assemblies busied themselves with all the details of foreign policy as well as of internal management. The penalty for non-observance of their decrees was expulsion from the League (*Verhansung*). The chief offence which brought this punishment on a town was the admission of democratic tendencies. The struggle between the artisans and the old burgher families, which is so important a feature of European history in the 13th and 14th centuries, necessarily affected the Hanse towns. It was for admitting artisans to the council that Brunswick was expelled from the League in 1375, and was not re-admitted till 1380, when the old constitution was restored.

Besides the central constitution of the Hansa, there are also traces of an internal grouping. At Bruges the German merchants are divided, according as they came from (1) the Wendish and Saxon towns, (2) Westphalia and Prussia, (3) Gothland, Livonia, and Sweden. This division is supposed to refer to a real division of the League, each third being gathered round one of the three chief towns, Lübeck, Cologne, and Wisby. But in later times we find the League divided into four quarters with their respective capitals,—Lübeck, Cologne, Brunswick, and Dantzic.

Although, by comparing the documents which have come down to us, we can trace the existence of a fairly definite system of government, yet we must not imagine that this system was carried out with the regularity of a modern constitution. The composition of the League was always fluctuating, and it is impossible to say at any fixed time how many members it contained. The towns lay scattered over a large territory extending from Revel to the Scheldt, and their interests, both territorial and commercial, must have often clashed. It was only in time of danger that the League displayed any real consistency. When the immediate danger was withdrawn, the want of union soon made itself again manifest. It is true that the towns joined the League of their own accord, but when they had joined, they tried to make their position as independent as possible. They never considered themselves bound to send deputies to the general assemblies. When the deputies did appear they usually came late, and after a matter had been discussed they would insist on referring it to the town-council at home, as their own powers were insufficient. The wonder lies, not in the dissensions which sprang up among the towns, but in the fact that for three centuries they did in a manner hold together, and not infrequently sacrificed their individual advantages for the common good.

From the very moment of the treaty of Stralsund, the weakness of a community founded chiefly on commercial interests began to show itself. The eastern Baltic towns, especially those of Prussia, were indignant at the erection of a staple at Lübeck. They desired to trade directly with England and Flanders. To repress this movement Lübeck as the head of the League entered into the closest relations with the Teutonic order. But the evil of these dissensions lay in the fact that they distracted the attention of the Hanse towns from events in Scandinavia. The influence guaranteed to them by the treaty of Stralsund was never exercised, and their supineness allowed Margaret, Waldemar III.'s daughter, to unite the crowns of the three Scandinavian kingdoms at Calmar in 1397. The erection of a powerful northern state was obviously dangerous to the ascendancy of the Hansa. About the same time their allies, the Teutonic knights, were threatened in a similar manner by the accession of the Jagellon dynasty in Poland. The battle of Tannenberg (1410) and the peace of Thorn

(1411) were clear signs that the Slavonic race was beginning to turn the tables on its German oppressors. At one time it seemed probable that Slavs and Scandinavians would unite in a great anti-German crusade, and that the Hansa and the Teutonic order—the pioneers of German civilization in northern Europe—would fall victims to the alliance. During the 15th century the Hanse towns were frequently compelled to seek safety in arms. Their constant policy was to break up the union of Calmar. In 1428 they sent a large fleet against Eric, Margaret's successor, who wished to add Schleswig and Holstein to his possessions. The accession of two German princes, Christopher of Bavaria and Christian I. of Oldenburg, to the Danish crown was due in no slight measure to the exertions of the Hansa. On the whole the League held its own in this century, though not without considerable and increasing difficulty.

But with the 16th century the Hansa begins really to decline. The English and Dutch proved formidable rivals for the commercial supremacy in northern Europe. Henry VII. secured in 1489 a treaty from Hans of Denmark, which gave England the right of commerce in the northern seas, and which enabled English merchants to found mercantile establishments in the ports. The herrings no longer came in crowds to the Swedish and Norwegian coasts, where the members of the Hansa had so long held a practical monopoly of the fisheries. These fish made at this time one of their periodical changes of course, and went to the coasts of Holland. The Dutch were not slow to grasp at the advantages thus offered to them. Another great blow was dealt to Hanseatic commerce by the grand discoveries of the age. Most of the German towns were out of the way of the new commercial routes, and could scarcely hope to hold their own with more favourably situated countries.

Besides these causes of decline, the domestic position of the Hanse towns had altered very much for the worse. While in other countries the power of the feudal nobles had fallen before the rapid rise of the monarchy aided by the sympathy of the commons, in Germany alone the power of the princes had constantly increased, at the expense of both king and people. The Reformation and the consequent secularization of church property in northern Germany only served to strengthen the hands of the lay princes. Such a state of things was fatal to the independence of a town league which had always stood opposed to the lawless independence of the nobles. Gradually most of the towns fell off from the League. Foreign countries triumphed at the fall of their formerly successful rival. In Elizabeth's reign the Hanse merchants in London lost the privileges which they had held since the time of Henry III.

Religious disturbances and the fearful disasters of the Thirty Years' War completed the work thus begun. The peace of Westphalia restored the form but not the reality of the League. In 1669 the last general assembly was held. Henceforth the name of Hanse towns was kept by Lübeck, Hamburg, and Bremen, but it was to designate their independence, not their union.

HANSEN, PETER ANDREAS (1795-1874), astronomer, was born on December 8, 1795, at Tønder, in the duchy of Schleswig. When a youth he served an apprenticeship to a clock and watchmaker at Flensburg, with whom he remained several years. During this time he exhibited an

intense interest for mathematics and the physical sciences, which was the means of his introduction in 1820 to Schumacher, professor of astronomy at Copenhagen, who, appreciating Hansen's abilities, engaged him to assist in the measurement of an arc of meridian in Holstein. This led to his appointment as assistant to Schumacher at the observatory of Altona, on its foundation in 1823. Hansen's reputation as an excellent mathematician had by this time become generally known, and in 1825 he was selected to succeed Professor Encke as director of the observatory of Seeberg, near Gotha. There he remained for the rest of his life, devoting his talents to the development of the highest branches of mathematical astronomy, with an originality of conception which was acknowledged by the English Royal Astronomical Society on two occasions, by the award of their gold medal for his researches in physical astronomy and his lunar tables. His *Tables de la Lune* appeared in 1857, published at the expense of the British Government; they have been adopted for use in the calculations of the *Nautical Almanac*. In addition to his important volume containing the full details of the formulae explanatory of his lunar theory, Hansen was the author of a large number of miscellaneous astronomical papers, principally relating to the orbits of comets and planets or to perturbational astronomy. In one of these he was the first to point out that Encke's value of the horizontal equatorial solar parallax required to be increased to reconcile the lunar theory with modern observations,—an opinion which was subsequently confirmed by Le Verrier from his planetary researches, and by the observations of Mars and the transit of Venus of 1874. Hansen was a foreign member of the Royal Society, and an associate of the Royal Astronomical Society. He died on March 28, 1874, at the age of seventy-eight.

HANSTEEN, CHRISTOPHER (1784–1873), astronomer and physicist, was born at Christiania, Norway, September 26, 1784. From the cathedral school he went to the university at Copenhagen, where first law and afterwards mathematics formed his main study. In 1806 he taught mathematics in the gymnasium of Frederiksberg, Zealand, and the following year he commenced the inquiries in his favourite branch of science—terrestrial magnetism—which have made his name famous. He took in 1812 the prize of the Danish Royal Academy of Sciences for his reply to a question on the magnetic axes. Appointed lecturer in 1814, he was in 1816 raised to the chair of astronomy and applied mathematics in the university of Christiania. In 1819 he published his researches on terrestrial magnetism, a work which attracted the notice of the physicists of Europe and particularly of England, where the search for a formula by which the variation of the needle might be found at any given time and place was being actively pursued. The researches were translated into German by P. T. Hanson, under the title *Untersuchungen über den Magnetismus der Erde*, with a supplement containing *Beobachtungen der Abweichung und Neigung der Magnetnadel*, and an atlas. The rules there framed for the observation of magnetical phenomena have been generally followed. Hansteen hoped by them to accumulate analyses for determining the number and position of the magnetic poles of the earth. In prosecution of his researches he visited London, and also Paris and other Continental cities, and travelled over Finland and the greater part of his own country; and in 1828–30 he undertook, in company with Ermann and Due, and with the cooperation of Russia, a Government mission to Western Siberia, the chief aim of which was to find the ideal point of the Asiatic pole of magnetism—ten observatories being established in Russia to further the project. The scientific results—magnetic, astronomic, and meteorological—form the bases of many valuable theories. A narrative of the personal adventures

soon appeared (*Reise-Erinnerungen aus Sibirien*, 1854; *Souvenirs d'un voyage en Sibérie*, 1857); but the chief work was not issued till 1863 (*Resultate magnetischer Beobachtungen*, &c.). Shortly after the return of the mission, an observatory was erected in the park of Christiania (1833), and Hansteen was appointed director. On his representation a magnetic observatory was added in 1839. In 1835–38 his text-books on geometry and mechanics were published; and in 1842 he wrote his *Disquisitiones de mutationibus quas patitur momentum acus magneticae*, &c. He also contributed various papers to different scientific journals, especially the *Magazin for Naturvidenskaberne*, of which he became joint-editor in 1823. He superintended the trigonometrical and topographical survey of Norway, begun in 1837. He was a member of the Royal Society of London, the French Institute, the American Academy of Arts and Sciences, and the Academies of Berlin and St Petersburg. In 1861 he retired from active work, but still pursued his studies, his *Observations de l'inclinaison magnétique* and *Sur les variations séculaires du magnétisme* appearing in 1865. Hansteen died at Christiania, April 15, 1873.

HANUSCH, IGNAZ JOHANN (1812–1869), Bohemian savant and philosopher, was born at Prague on the 28th November, 1812. He received his early education in his native city, and taught for a short time in a monastic school there. At the universities of Prague and Vienna, where he afterwards studied, he directed his attention successively to theology and law, and finally, under the influence of Hegel's writings, to philosophy. After temporarily supplying in 1835 the place of Lichtenfels, professor of philosophy at Vienna, he was next year appointed ordinary professor of philosophy at Lemberg, whence he passed in the same capacity to Olmütz in 1847, and two years later to Prague. There he began a successful course of philosophy in the Czech language, but in 1852 was abruptly suspended from teaching, owing to his leanings towards Slavism. He still, however, retained his full salary; and in 1860 he was nominated director of the imperial university library at Prague, where he died on the 19th May 1869.

His chief writings, mainly on philosophic and Slavonic subjects, are the following:—*Wissenschaft des Slavischen Mythos* (1842); text-books in *Logik* (1843), *Ethik* (1866), *Metaphysik* (1846), and *Empirical Psychology* (1849); *Geschichte der Philosophie von ihren Ursprüngen bis zur Schliessung der Philosophenschulen unter Justinian* (1850); *Vorlesungen über die Kulturgeschichte der Menschheit* (1849); *Quellenkunde und Bibliographie der böhmisch-slawischen Literatur* (1863). Besides these and others, Hanusch wrote some works in Czech, and published the works of the old Slavonic philosopher, Ritter Thomas, in 1852.

HANWAY, JONAS (1712–1786), an English traveller and philanthropist, was born at Portsmouth, but he was still a child when the death of his father, a victualler by trade, caused his mother to remove with her family to London. At the age of seventeen the boy was apprenticed to a merchant in Lisbon, and he remained there till he entered business for himself. In 1743, after he had been for some time again in London, he became a partner with Mr Dingley, a merchant in St Petersburg, and in this way had his attention turned to the trade between Russia and Persia. Leaving St Petersburg on the 10th of September 1743, and passing south by Moscow, Zuritzin, and Astrakhan, he embarked on the Caspian on November 22d, and arrived at Astrabad on December 18th. Here his difficulties began. The town was attacked and captured by a rebel, Mohammed Hassan Beg, his goods were seized, and it was only after great privations that he reached the camp of the Shah Nadir. Obtaining an order for the restoration of his goods he returned to Astrabad, and succeeded in recovering about 60 per cent. of their original value; but he was obliged to retrace his steps, and after a painful journey, during which he was attacked by pirates, detained by sickness, and obliged to perform six weeks' quarantine.

he arrived at St Petersburg July 9, 1750. The autumn of that year he spent travelling in Germany and Holland, and on October 28th he landed in England, where the narrative of his travels published in 1753 soon made him a man of note. The rest of his life was for the most part spent in London, and his leisure was devoted to the advocacy and support of all kinds of useful and benevolent enterprises. In 1762 he was appointed one of the commissioners for victualling the navy, and on his resignation in 1783 he received the whole of his salary as a pension. He died September 5, 1786. Hanway was naturally a healthy and active man; in Russia he was known as the handsome Englishman; but the efforts of his travels in Persia rendered him somewhat of a valetudinarian. He is popularly known as the first Englishman to carry an umbrella in his native country; this he persisted in using in spite of all the efforts of the hackney coachmen to hoot or hustle him into conformity. He succeeded in writing down the custom of giving rails; and in his *Journey from Portsmouth to Kingston* he attacked the pernicious habit of tea-drinking, which, however, found an able and ardent defender in Dr Johnson. In 1757 he took an active part in founding the Marine Society, the object of which was to fit out poor boys and men for the navy; he was one of the originators of the Magdalen Hospital; it was due to his continued efforts that the Act of George III. was passed for the better treatment of the parish infants; and in 1785 he took up the lamentable case of those little chimney-sweeps whose dangerous occupation is now a thing of the past. The method of solitary confinement for prisoners found in him one of its earliest advocates, and in various other ways he sought to improve the chances of the criminal population. "Every man," was his theory, "is capable of good if properly treated. If doing justice to an offender implies an attempt to reform him by using the proper means, by parity of reasoning the using of improper means is doing injustice." Hanway's writings are of little value except for the sake of the causes which they supported; while effective as pamphlets, they lack both style and method, and are apt to run over into platitudinous moralizings. See Pugh, *Remarkable Occurrences in the Life of Jonas Hanway, 1787*.

HAPARANDA, from *Haaparanta*, "Aspen-shore," a small town of Sweden in the district of Torneå, at the northern end of the Gulf of Bothnia, in 65° 51' N. lat. It lies about a mile from the mouth of the Torneå-Elf, exactly opposite the town of Torneå, which has belonged to Russia since 1809. Haparanda was founded in 1812, and at first bore the name of Carljohansstad or Charles John's Town. It received its municipal constitution in 1842. The inhabitants, who according to the census of 1875 number 944, carry on a brisk trade and engage in ship-building. Since 1859 the town has been the seat of a meteorological station, which is one of the most valuable in Europe, not only because it lies so far north, but also because of its position at the head of the Gulf of Bothnia, and immediately to the south of the line of junction between the permanently open sea and the sea which is frozen during the winter months, or, in other words, in the region where at certain seasons there is an extraordinary crowding together of the isothermal lines.

HAPSBURG, or **HABSBURO** (originally *Habichtsburg*, that is, Hawkscastle), an old German family which has given sovereigns to Germany, Spain, and Austria, takes its name from the old Swiss castle of Habsburg, now in ruins, situated on the river Aar in the canton of Aargau. The first mention of the countship of Habsburg is in a document of 1099, where the name Werner, count of Habsburg, occurs in connexion with the consecration of the monastery of Muri as confirming the grants of the pious foundations

made by his ancestors. This Werner of Habsburg was a nephew of Werner, bishop of Strasburg, who built the castle of Habsburg about the year 1020. The succession of the family cannot be traced between this period and the time of the emperor Frederick Barbarossa, but in a document whose date is 30th May 1153, Werner II. and his son Albert the Rich are mentioned as counts of Habsburg. This Albert was by Frederick created landgrave of Upper Alsace, and received the countship of the district of Zürich and the protectorship of the monasteries of Seckingen and Murbach; and on the extinction of the house of Zähringen he also succeeded to a considerable portion of their territories. Albert died in 1199, and was succeeded by his son Rudolf the Old, who, as a reward for placing a large sum of money at the disposal of Frederick II., received from him the countship of Aargau. He held an influential position among the Swabian nobility, and so increased his possessions that they included the territories of the bishops of Strasburg, Constance, Basel, Coire, Ghent, and Lausanne, and of the abbot of St Gall, in addition to which he also obtained the countship of Frickgau. Rudolf left behind him two sons, Albert the Wise and Rudolf II., who shared the possessions between them, and founded respectively the lines of Hapsburg-Hapsburg and Hapsburg-Laufenburg.—Albert, besides the castle of Hapsburg, holding the lands in Aargau and Alsace, and Rudolf the countships of Klettgau, Rheinfeld, and Laufenburg, and the possessions in Breisgau. The Laufenburg line also divided into two branches, the former of which became extinct in 1408 and the latter in 1415. Laufenburg thereupon fell to Austria, and Klettgau, through the marriage of the female heiress of the line, to the counts Sutz, from whom it passed by marriage in 1687 to the house of Schwarzenberg. Albert the Wise of Hapsburg-Hapsburg was married to the countess of Kyburg, who was descended from the dukes of Zähringen, and related to the emperor Frederick II. From this union there was born on the 1st May 1218, Rudolf, the founder of the royal dynasty of Hapsburg. He was elected king of Germany in 1273, and after the defeat and death of Ottocar, king of Bohemia, in 1278, at Marchfeld on the Danube, he annexed to his possessions Austria, Styria, Carinthia, and Carniola. On the death of Rudolf in 1291 Adolf, count of Nassau, was elected his successor to the German crown, but although on the death of Adolf it again reverted to the Hapsburg line in the person of Albert I., it passed on his death to Henry, count of Luxembourg, and with the exception of the doubtful period when Frederick, eldest son of Albert, and Lewis, duke of Bavaria, divided the suffrages of the electors and were crowned, the one at Bonn and the other at Aix-la-Chapelle, the Hapsburg line remained excluded from its possession till the time of Albert II., who succeeded Sigismund as king of Bohemia and Hungary in 1437, and was chosen emperor of the Romans in 1438. The greater part of the original lands of the house were gradually lost by the victories of the Eidgenossen, who finally in 1474 obtained Aargau, in which the castle of Habsburg was situated. Philip, son of Maximilian I. and of Donna Juana of Spain, ascended the Spanish throne in May 1506, and on his death in September of the same year, he was succeeded by Charles I., who was chosen emperor in 1519, and was thenceforth known as Charles V. In 1521 Charles granted his Austrian possessions to Ferdinand I., who became the head of the Austrian dynasty. The Spanish branch became extinct in 1700 with the death of King Charles II., and the male line of the Austrian branch became extinct with the death of the emperor Charles VI. in 1740; but the Austrian house was continued in the female line by Maria Theresa, who by her marriage with Francis of Lotharinga, chosen emperor in 1745, founded

the line of Hapsburg-Lotharingia, from which the present imperial dynasty of Austria is descended.

The main facts of the history of the house of Hapsburg, from the time of Rudolf I., king of Germany, will be found in the articles AUSTRIA (vol. iii. p. 124), GERMANY (vol. x. p. 496), and SPAIN. See also Coxe's *House of Austria*, 2 vols., London, 1807; Herrgott's *Genealogia diplomatica augustæ gentis Habsburgicæ*, Vienna, 1737-38; Kopp's *Vindicia Actorum Murensium*, Leipsic, 1751; Röpell, *Die Grafen von Habsburg*, Halle, 1832; Eichnowski, *Geschichte des Hauses Habsburg*, 8 vols., Vienna, 1836-37; Huber in the *Annalen of the Vienna Academy* for 1873; Münch, "Die Münze zu Laufenburg, nebst einem Abriss der Geschichte der Grafen von Habsburg-Laufenburg," in *Argovia*, vol. vii., 1874; and the same writer's "Regesten der Grafen von Habsburg, laufenburgischer Linie, 1193-1408," in vol. x. of the same publication, 1879.

HÁPUR, or HAPOOR, an ancient town of India in the Meerut district, North-Western Provinces, 28° 43' 20" N. lat., 77° 49' 45" E. long., lies on the Meerut and Bulandshahr road, 18 miles south of the former city. During the mutiny, Walidád Khán of Málágarh threatened Hápur, but was obliged by the loyal Játs of Bhatona to retire. Several fine groves surround the town, but the wall and ditch have fallen out of repair, and only the names of the five gates now remain. It contains a *tahsil*, a police station, school-house, dispensary, 3 *saráis*, 28 mosques, and 25 temples. Considerable trade is carried on in sugar, grain, cotton, timber, bamboos, and brass utensils. Population (1872), 14,544, comprising 8696 Hindus, 5847 Mahometans, and 1 Christian. Municipal revenue (1875-76), £1208.

HARAN, or CHARRAN (Hebrew, *חָרָן*; LXX., *Χαρράν* or *Χαρρά*; Strabo, *Κάρραι*; Pliny, *Carræ* or *Carrhæ*; Arabic, *Harrân*) is the name of a fertile district in the north of Mesopotamia (Padan-aram or Aram-nabaram), and also of a town situated some 10 miles south-eastward of Edessa (Orfa), on the banks of the small river Belik about 50 miles to the north of its junction with the Tophrates. It thus lies immediately on the highway between Arrapachitis and Canaan, and at the point where that highway is crossed by the great western road connecting Media, Assyria, and Babylonia with the Cilician coast. For the Assyrians accordingly it became a strategic position of first-rate importance, and in this aspect it is mentioned in inscriptions as early as the time of Tiglath Pileser I., about 1100 B.C. (see Schrader, *Die Keilinschriften und das alte Testament*, p. 45; and compare 2 Kings xix. 12, Isa. xxxvii. 12). It also, for the same reason, ultimately became the centre of a considerable commerce (Ezek. xxvii. 23), one of the specialties particularly named being the odoriferous gum derived from the strobilus (Pliny, *II. N.*, xii. 40). It was here that Crassus in his eastern expedition was attacked and slain by the Parthians (53 B.C.); and here also the emperor Caracalla was murdered at the instigation of Macrinus (217 A.D.). Herodian (iv. 13, 7) mentions the town as possessing in his day a temple of the moon; in the Middle Ages it is mentioned as having been the seat of a particular heathen sect, that of the Haranite Sabæans. It retained its importance down to the period of the Arab ascendancy; but by Abulfeda it is mentioned as having before his time fallen into decay. It is now wholly in ruins. According to the patriarchal history (Gen. xi. 31), Haran was the first resting-place of Terah and his family after their migration from Ur of the Chaldees, and here Terah and Nabor remained when Abraham and Lot passed on to Canaan. According to Dr Beke, indeed, this Haran is not the well-known town on the Belik, but "a place of that name (Harrân el-Awamid) between Abana and Pharpar, the two rivers of Aram or Syria" (see *Journ. of Royal Geog. Soc.*, vol. xxxii.). His arguments, however, have not been generally accepted as sufficient to set aside the powerful evidence in favour of the Mesopotamian site.

HARAR, HERER, HURRUR, HARRAR-GAY, or ARARGE, a city of north-eastern Africa, in the country of the Gallas, at

one time the capital of the province of Hadiyuh in the Zayla empire, for a long period a small independent state under an emir of its own, and since 1876 subject to the Egyptian crown. The Somali call it Adari and the Gallas Adaray. According to Burton it stands in 9° 20' N. lat. and 42° 17' E. long, but the *Bulletin de l'état major général de l'armée égyptienne* makes the latitude 9° 26' and the longitude 42° 6'. The height above the sea is according to Burton 5500 feet, and according to the *Bulletin* 5580. A stone wall, pierced by five gates and flanked by 24 towers, encloses the city, which occupies an area of 128 acres on the irregular slope of a hill, and comprises 9560 houses and 346 huts, arranged in narrow streets that run up and down hill. There are five mosques within the walls, but only one, the *jami* (or cathedral, so to speak), is a building of considerable dimensions. The palace of the emir is a mere shed, long, single-storied, and windowless. Among the chapels to Mahometan saints it is enough to mention that of Sheikh Umar Abadir El Bakai, the patron of the city. Harar has long been the seat of a considerable commerce, though before the Egyptian conquests the merchants had to submit to the exorbitant exactions of their Galla neighbours, who had command of all the caravan routes. Slaves, ivory, coffee, tobacco, safflower, cotton cloths, mules, holcus, wheat, glue, honey, and gums are mentioned by Burton among their principal articles of trade, in return for which they brought back a great variety of wares for local consumption. The Harar coffee especially has a high repute, and the tobacco also is good. The *kât* or *gât* (*Catha edulis* of Forskal), the leaves of which are a favourite stimulant or narcotic in north-eastern Africa, grows abundantly in the neighbourhood; and the inhabitants often sit together reading the Koran and enjoying the drug for ten or eleven hours at a time. The rainy season at Harar begins about the 15th of March, and lasts for six months, the heaviest rains occurring about June. In the hot season the thermometer reaches 61° Fahr.; in March and April it is not more than 49°. According to Burton the population of the city was only 8000, of whom 2500 were Somali and 3000 Arabs; but the *Bulletin* states the total at 35,000.

The Harari proper are of a distinct stock from the neighbouring peoples, and speak a special language. A small glossary in Salt's *Abyssinia*, and another in the *Philological Journal* for 1845, were the only materials available for the investigation of the language previous to the publication of Burton's sketch in his *First Footsteps in North-Eastern Africa*. By him it is maintained that the Hararese is semi-Semitic or, like the Galla, Dankali, and Somali, "a Semitic graft inserted into an indigenous stock;" and his opinion is followed by Bleek and Lepsius. The older statement, strongly supported by Burton, that the language is fundamentally Semitic, and has a special affinity with Amharic, has in its favour no less authorities than Friedrich Müller (*Sitzungsbericht der Wiener Akademie*, Dec. 1863) and F. Prætorius ("Ueber die Sprache von Harar," in *Zeitschrift der deutschen Morgenländ. Gesell.*, 1869). The Harari are Mahometans of the Shafai or Persian sect; and they employ the solar year and the Persian calendar. Monogamy prevails, and the women exercise great social influence; but the moral character of the people is said to be very low. It was in 1521 that Harar became a Mahometan city. Burton, the first European to put foot within its walls, spent ten days there in 1854-55, but it was only under the guise of an Arab that he was able to do so. Mohammed Mokhtar, the Egyptian general, has drawn up a sketch of the history of Harar from the native manuscripts brought with him to Cairo, and in company with Abd' Allah Faouzi he has published a plan of the town in the *Bulletin* already quoted (Cairo, 1876).

HARBOURS AND DOCKS

I. HARBOURS.

ALL harbours may be classed either as havens for the protection of ships during storms, or as ports suited for commercial purposes. Of the first mentioned class, or those which are called harbours of refuge, some are natural and some artificial.

The designing of harbours constitutes confessedly one of the most difficult branches of civil engineering. In making such a design the engineer, of course, avails himself of the information which is derived from past experience, and endeavours, to the best of his power, to institute a comparison between the given locality and some existing harbour which he supposes to be similarly situated. Perfect identity, however, in the physical peculiarities of different localities seldom if ever exists, and all that can be done in deriving benefit from past experience is to select the harbour which seems most nearly to resemble the proposed work.

In order the better to understand the nature of the difficulties which beset the marine engineer, let us suppose that he is called upon to design works for the accommodation of shipping in a given locality. The questions which immediately press on his attention are—(1) What is the cheapest kind of design that is suitable for the place and sufficient for the class of shipping which has to be accommodated? and (2) What are the smallest sizes of materials and thickness of walls that are admissible in its construction? as on these the cost of the work will materially depend. Before considering how far it is possible to answer such questions, let us endeavour to define the varieties of design into which all sorts of harbours may, with propriety, be resolved.

In the first place they may be all classified under two main heads—viz., *interior works* and *exterior works*.

The interior works are provided for the accommodation and repair of vessels, while the exterior works may be conveniently enough divided into the following five classes.

1. *Harbours of Refuge and Anchorage Breakwaters*.—These consist of one or more breakwaters, so arranged as to form a safe roadstead, which shall be easily accessible to the largest vessels in all states of the weather and tide. A breakwater forms a barrier either complete or partial to the progress of the waves, and is intended for sheltering the anchorage ground under its lee. It is not used for commercial traffic as are piers or quays, and therefore a parapet is not necessarily required for preventing the waves from breaking over the top, although this may be useful as a protection against the wind.

2. *Deep-water and Tidal Harbours for Commercial Purposes* (fig. 1, *a, b*).—A harbour for commercial purposes is any arrangement of piers or breakwaters, or of both, which

Fig. 1.

encloses and so tranquilizes a sheet of water, that vessels may be moored at the quay walls or wharves which form the inner sides of the piers. Where the coast line lies open to

a very heavy sea it is often found necessary to make a double or compound harbour (fig. 1, *b*). In such a case the entrance to the inner basin is situated within the sheltered area formed by the outer works.

3. *Kanted or Curved Piers* (fig. 1, *c*).—Where there is a single pier of this kind vessels lie under the lee of the kant or kants, and the sheltered side of the pier is therefore finished as a quay. As the outer end of any such single pier is surrounded by the open sea, it may be convenient to call it a “free end” in contradistinction to the outer end of a close harbour, where the sea room in the fairway is limited to the breadth of the entrance which ought, for sheltering the basin, to be made as narrow as is consistent with the safe passage of vessels. Both extremities of all single insulated breakwaters are of course free ends, as are also the seaward ends of all single breakwaters which are connected with the land.

4. *Straight Piers* (fig. 1, *d*).—A straight pier generally projects at right angles to the coast line, with a free end at its seaward extremity; and, unless when the wind blows right in upon the shore, a straight pier will always afford some shelter on its lee side.

5. *Quay or Wharf* (fig. 1, *e*).—A quay wall is usually built parallel to the line of shore. It affords no shelter of any kind, and the only advantage which it possesses is that of enabling vessels to load and unload without their having to “beach,” or, where the shores are steep, even to take the ground.

It will be observed that all the kinds of piers or harbours just enumerated differ materially from each other in the amount of shelter which they afford, and are suitable for places having very different degrees of exposure. The first step to be taken, therefore, is to select from the different classes of designs which have been enumerated the one which is best adapted to the physical peculiarities of the situation. The engineer in order to make this selection judiciously must keep in view the essential elements of stability, economy, safety of ingress and egress, and convenient accommodation for the trade of the port. If the place be much exposed, he must therefore arrange the different parts of the work so as to produce a harbour which may be easily taken and left in stormy weather, without endangering the tranquillity of the internal area; for it is the combination of the qualities of an easy and safe entrance and exit, with a good “loose” and a smooth interior, which alone constitutes a good harbour. Lastly, he must fix the width of the piers and height of the parapets.

The local characteristics which at the outset demand our consideration are—(1) the geological and other physical peculiarities of the shore; (2) the exposure; (3) the force of the waves due to the exposure; (4) the strength, direction, and range of the tides; (5) the depth of the bay or sea in which the harbour is to be built; (6) the proximity of deep water to the works, or in other words, the slope of the foreshore; and (7) the angle at which the heaviest waves impinge on the coast line and on the works.

Before considering some of these questions the reader may refer to figs. 2 and 3, on which are marked the technical names of different parts of harbour works.

Generation of Waves.

Mistakes as to the level of the highest tides are sometimes made by drawing too hasty conclusions from the presence of vegetable life. In the Shetland Islands there may often be seen huge blocks of rock (and to these reference will afterwards be made), which during storms have

been driven over the land at heights much greater than that at which vegetation commences and far above the ordinary run of the surf.

The level below the surface of low water at which mud reposes will be found of very considerable value in judging of the exposure of a coast. It may appear unlikely that the disturbance of the surface of the sea occasioned by storms should be propagated to great depths, but there is no want of evidence on this head. Sir G. B. Airy, the astronomer-royal, has shown, on theoretical grounds, that at a depth equal to the length of the wave the motion is $\frac{1}{25}$ of that at the surface, and mentions that heavy ground swells break in a depth of 100 fathoms. Sir J. Coode found, from underwater examinations made with the diving dress, that the shingle of the Chesil Bank was moved during heavy winter storms at a depth of 8 fathoms; and Captain E. K. Calver, R.N., has seen waves 6 or 8 feet high change their colour

the sea—to the coasts of Holland, where the waves are much modified. Although it is no doubt true that the flat-bottom vessels of the Dutch are built purposely for resisting a heavy surf, still the fact of their being able to take the open beach in nearly all weathers without any protection from harbours proves that the waves are very much reduced before they reach the Dutch coast. Mr Hyde Clarke says —“On the coast of Zealand the Dutch reckoned $8\frac{1}{2}$ feet as the greatest height to which any wave would be thrown.”

In comparing an existing harbour with a proposed one, perhaps the most obvious element is what may be termed the *line of maximum exposure*, or, in other words, the line of greatest fetch or reach of open sea, and this can be easily measured from a chart. But though possessed of this information, the engineer still does not know in what ratio the height of the waves increases in relation to any given increase in the line of exposure.

In 1852, in the *Edinburgh New Philosopher, Journal*, Mr Thomas Stevenson stated as the result of experimental observation that the heights of the waves were most nearly “in the ratio of the square roots of their distances from the windward shore;” or, when h = height of wave in feet, d = distance in miles, and a a coefficient varying with the strength of the wind, then

$$h = a\sqrt{d}.$$

The truth of this law has since then been variously tested.¹ The accompanying table contains some of the observations made in 1850–52, as well as later observations on the effects of heavy gales which could only be made at long intervals of time:—

Law of ratio of square roots of the distances from the windward shore

Fig. 2.

Fig. 3.

from the abrasion of the bottom after passing into water of 7 or 8 fathoms. Captain Cialdi maintains that waves may excavate the bottom at a depth of 655 feet in the ocean, of 163 feet in the Mediterranean, and of 132 feet in the English Channel and Adriatic. From these statements it may easily be inferred that in exposed situations mud cannot repose near the surface. Applying such a test to the German Ocean, it is found that in Shetland mud lies in from 80 to 90 fathoms below low water, and its level gradually rises till, on the coast of Holland, it is found at a depth of from 16 to 12 fathoms at the mouth of the Elbe. Now, the violence of the waves upon the shores of the German Ocean certainly corresponds with the rise in the level of the mud, there being a gradual decrease as we come from Shetland and the north of Scotland—where, as will be afterwards shown, wonderful energy is displayed by

Some of these earlier results have also been laid down in fig. 4, so as to form a storm curve, but since the diagram was made many more observations have been obtained which corroborate the law.

The formula $h = 1.5\sqrt{d}$ is represented by the parabolic curve in the diagram, which indicates pretty nearly the height of waves during heavy gales, at least in seas which do not greatly differ in depth from those where the observations were made. This formula is of course inapplicable where the water is not of sufficient depth to allow the

¹ It follows from this law that the heights of embankments of reservoirs above the water surface should, *ceteris paribus*, be proportional to the square roots of the lengths of water over which the wind acts.

² *Cours de Construction des Ouvrages Hydrauliques*, Liège, 1852, p. 8.

³ Mr Mallet, who made these observations, said that the extreme waves appeared to be about twice this height.

waves to be fully formed, or where it becomes so shallow as to reduce their height after they are formed.

It must be observed that in short fetches, as in narrow lochs or arms of the sea, waves are raised higher during very violent gales than the formula indicates; though it does not appear that such waves go on progressing in height in the same high ratio for any considerable distance.

num effect, and which are due to the line of maximum effective exposure, α = azimuthal angle formed between the directions of pier and the line of exposure; then, when the force is resolved normal to the line of pier,—

$$x \propto h \sin^2 \alpha;$$

but if the force be again resolved in the direction of the waves themselves, the expression becomes

$$x \propto h \sin^3 \alpha.$$

It should not, however, be forgotten, in connexion with this subject, that in some cases there are modifying elements to which special attention requires to be given. The waves, for example, when approaching the land obliquely, alter their direction when they get close to the shore, in consequence of the change of depth, and from this cause they approach more nearly at right angles to the general line of the beach, and thus strike with greater force than the line of maximum effective exposure would lead us to expect.

Fig. 4.

For short reaches and violent squalls, the formula given in column 5 of the foregoing table will be found more suitable, viz. :—

$$h = 1.5 \sqrt{d + (2.5 - \sqrt{d})}$$

For all ordinary situations the results in the following table will be found sufficient as a general guide.

Table showing approximate Heights of Waves due to lengths of Maximum Fetch by the Formulae.

The Comte de Marsilli, in 1725, observed waves 14 feet 10 inches in height where the longest possible fetch is 600 miles. At Wick, with much the same exposure, waves of about 40 feet have been seen to strike the breakwater. But the highest which are known to have been accurately measured were by Dr Scoresby in the Atlantic, where they attained the height of 43 feet above the hollow. Cialdi gives observations of others which were from 60 to 108 feet high, but he does not state how the heights were ascertained.

It does not follow, however, that the line of the maximum exposure is in every case the line of maximum effective force of the waves, for this must depend, not only on the length of fetch, but on the angle of incidence of the waves on the walls of the harbour. What may be termed the line of maximum effective exposure is that which, after being corrected for obliquity of impact, produces the maximum result, and this can only be ascertained from the chart by successive trials.

Let x = the greatest force that can assail the pier, h = height of waves which produce (after being corrected for obliquity) the maxi-

um effect, and which are due to the line of maximum effective exposure, α = azimuthal angle formed between the directions of pier and the line of exposure; then, when the force is resolved normal to the line of pier,—

but if the force be again resolved in the direction of the waves themselves, the expression becomes

It should not, however, be forgotten, in connexion with this subject, that in some cases there are modifying elements to which special attention requires to be given. The waves, for example, when approaching the land obliquely, alter their direction when they get close to the shore, in consequence of the change of depth, and from this cause they approach more nearly at right angles to the general line of the beach, and thus strike with greater force than the line of maximum effective exposure would lead us to expect.

The extraordinary difference between waves which impinge at right angles and others which have even a very slight amount of obliquity has been shown in the most unmistakable manner at the Wick breakwater, where all attempts to make the work stand when exactly at right angles to the waves have hitherto been unsuccessful. It was found by observation that while waves coming from the direction of S. by E. struck the outer part at normal incidence, they struck the landward end of the same kant at an angle of 81°, giving 9° of obliquity. This small measure of relief was found to make a great difference in the impact upon the wall.

The value of the line of effective exposure varies in certain localities with the geographical configuration of the land, as in Loch Fyne, where the wind seems to alter its direction with the winding of the loch, so that the effective fetch is greater than the width of free water at the place. On the other hand, where the channel expands, the height of the waves is decreased, as at Craignure in Mull, where the highest wave observed during the winter of 1853-4 was very much less than the formula indicates.

In a case such as represented in fig. 5, the waves which enter the entrance channel or harbour mouth B, though generated apparently in the fetch AB, are largely due to the fetch CB. For the waves generated in the length CA pass round the point A, and are thereafter subject to the impulse of the wind along the line AB. The waves then which enter the harbour mouth, instead of having their point of genesis at A, really take their origin at C, and their height is due to the fetch CB, though reduced by a deflexion round the point A.

Fig. 5.

Lateral friction is due to the passage of the end of the wave along the face of a vertical wall, while lateral erosion is due to the end of the wave breaking as it passes along the face of long talus walls or sloping beaches.

Force of Waves.

Smeaton, in referring to the propriety of using joggles in the masonry of the Eddystone Lighthouse, says—"When we have to do with and to endeavour to control those

powers of nature that are subject to no calculation, I trust it will be deemed prudent not to omit, in such a case, anything that can without difficulty be applied, and that would be likely to add to the security." This statement of our greatest marine engineer indicates the propriety of carefully collecting any facts that may help us to a more accurate estimation of those forces which he regarded as being "subject to no calculation."

At the Bishop Rock lighthouse, a bell was broken from its attachments at the level of 100 feet above the high water mark during a gale in the winter of 1860, and at Unst, the most northern of the Shetland Islands, a door was broken open at a height of 195 feet above the sea. To these facts it may be added that, as proved by the testimony of an eye-witness, a block of 50 tons was moved by the sea at Barrahead, one of the Hebrides. But still more extraordinary effects have been observed at Whalsey in Shetland, where heavy blocks have been quarried, or broken out of their beds *in situ*, on the top of the Bonud Skerry at a great elevation above the sea. On the south-east side, about 370 feet from the low water mark, and at a height of 62½ feet above its level, there occurs a remarkable beach of angular blocks varying in size from 9½ tons downwards, which are huddled together just as one would have expected to find, had they been elevated only a few feet above the high water level. Towards the north-east at the level of 72 feet above the sea, in addition to many smaller blocks which had evidently been recently detached, there was one 5½ tons in weight. It presented the appearance of recent detachment, having a fresh unweathered look. Within 20 feet of the spot where it lay, there was a comparatively recently formed void in the rock, which upon examination and comparison by measurement was found to suit exactly the detached block. Here then was a phenomenon so remarkable as almost to stagger belief—a mass of 5½ tons not only moved but actually quarried from its position *in situ* at a level of 72 feet above high water spring tides; and higher up still there was another detached rock weighing no less than 13½ tons tilted up in a peculiar position, and underneath which numerous angular masses had been wedged, obviously by aqueous action.

But by far the most striking effects as yet recorded were at the harbour works of Wick, which were commenced in 1863, and consisted of blocks of from 5 to 10 tons set on edge, first built above high water neap tides with hydraulic lime, then with Roman and latterly with Portland cement. In October 1864, 300 feet of the contractor's staging were carried away; and greenheart were afterwards substituted for Memel piles, but these too were broken by the sea. The first portion of the wall was, in conformity with usual practice, founded at 12 feet below low water, but 18 feet was subsequently adopted, and the rubble has since been washed down to 15 feet below that level. In 1872 a huge monolithic block of concrete, weighing in all 1350 tons, was removed *en masse* out of its position and carried to leeward of the breakwater. Extraordinary as this may appear, it was surpassed in 1873, when another concrete mass which had been substituted for the one that was moved, was in like manner carried away, though it contained 1500 cubic yards of cement rubble, the weight of which was about 2600 tons.

Fig. 6.

The marine dynamometer was constructed by Mr T. Stevenson for the purpose of ascertaining the force of the waves against the obstacle. DEF (fig. 6) is a cast-iron cylinder, which is firmly bolted at the projecting flanges G to the rock where the experiments are to be made. This cylinder has a circular flange at D. L is a door which is opened when the observation is to be read off. A is a circular disk on which the waves impinge. Fastened to the disc are four guide rods B, which pass through a circular plate C (which is screwed down

to the flange D), and also through holes in the bottom of the cylinder EF. Within the cylinder there is attached to the plate C a very strong steel spring, to the other or free end of which is fastened the small circular plate K, which again is secured to the guide rods B. There are also rings of leather T, which slide on the guide rods, and serve as indices for registering how far the rods have been pushed through the holes in the bottom EF, or, in other words, how far the spring has been drawn out by the action of the waves against the disk A. These disks were from 6 to 9 inches in diameter.

The greatest result obtained by the dynamometer at Skerryvore Lighthouse, in the Atlantic, was during the heavy westerly gale of 29th March 1845, when there was registered a force equivalent to 6083 lb, or nearly 3 tons, per square foot, deduced from the area exposed. The next highest was 5323 lb. In the German Ocean the greatest result obtained at the Bell Rock was 3013 lb per square foot. But subsequent and much more extended observations at Dunbar, in the county of East Lothian, gave 3½ tons; while at the harbour works of Buckie, on the coast of Banffshire, the highest result of observations, extending over a period of several years, was 3 tons per square foot.

Mr David Stevenson, when referring, in 1835, to the lakes in North America, pointed out that the general depth of water must, in order to allow the waves to be fully formed, be considerable, and that the sea must be unobstructed by shoals, and also of sufficient area to admit of the wind acting fully on the water.

If in front of a harbour shoal water extends seawards for a considerable distance so as to form an extensive flat foreshore, the depth of water above it becomes the true limit of the maximum wave, whatever may be the general depth of the sea outside. But at Arbroath harbour and at Alne mouth, the heaviest waves are tripped up by the shoal water near the mouths of the harbours, and are not found so dangerous to the works inside as the smaller waves which reach the beach in an unbroken state.

Mr Scott Russell states that waves break when they come into water of the same depth as their height. At Wick, however, the height of the waves above the mean level was about two-thirds of their height. In 1870, at Scarborough, it was found that waves of from 5 to 6½ feet broke when the depth was 10 feet 3 inches below their troughs, and 6 feet waves broke in water 13 feet 8 inches deep, which would for waves of this class give $h = \frac{1}{2}d$, where d is depth below mean level, and h the height from hollow to crest.

The late Dr Macquorn Rankine has shown that, theoretically, the mean water level is not situated half way between the crest and trough of the sea. The following formulæ furnished by him give the mean level of the sea from the height and length of the wave. These formulæ are exact only for water of considerable depth as compared with the length of the wave. For shallower water they are only approximate:—

Let L be the length of a wave, H the height from trough to crest; then, diameter of rolling circle = $\frac{L}{3 \cdot 1416}$, radius of orbit of particle = $\frac{1}{2}H$, and elevation of middle level of wave above still water = $\frac{3 \cdot 1416 H^2}{4L} = \cdot 7854 \frac{H^2}{L}$.

Consequently—

$$\text{Crest above still water} = \frac{H}{2} + \cdot 7854 \frac{H^2}{L};$$

$$\text{Trough below still water} = \frac{H}{2} - \cdot 7854 \frac{H^2}{L}.$$

Deep-Water Harbours.

Harbours of refuge are distinguished from tidal harbours mainly by the superior depth of water which they possess and the larger area which they enclose. The requisites are—shelter during storms, good holding ground, and easy access for shipping at any time of tide and in all states of the weather. A breakwater, though a passive, is yet a real agent, having true work to do. During storms many thousand tons of water are elevated and maintained above

Depth in front of a harbour regulates the height of waves.

Depth, at which waves break.

the sea-level; and a breakwater has to stop their onward motion within a given space or else to change the direction of their movement. There are two ways in which this work can be performed. One is by means of a plumb wall to alter the direction of the moving water by causing it to ascend vertically, and then to allow it to descend vertically, by which process the waves are reflected and sent back seawards. Another mode is to arrest the undulations by a sloping wall of length sufficient to allow the mass of elevated water to fall down upon the slope. If, however, the slope is not long enough to enable the waves to destroy themselves, they will, though reduced in height, pursue their original direction and pass over the top of the breakwater. In this case the breakwater does not do its full amount of work, and imperfect shelter is obtained.

The principle asserted in favour of the vertical wall is that oceanic waves in deep water are purely oscillatory, and exert no impact against vertical barriers, which are therefore the most eligible, as they have only to encounter the hydrostatic pressure due to the height of the impinging billows which are reflected without breaking.

From the effect of winds and tide-currents already referred to, and perhaps from other causes, the action of which seems to have been overlooked by the advocates of the upright wall, we have good reason for believing that any form of barrier, in whatever depth of water it may be placed, must occasionally be subjected to heavy impact. The possibility of waves of translation being generated in the deepest water is established by the following facts:—*first*, that oceanic waves break, partially at least, long before they reach the shore, because (as admitted by the advocates of the purely oscillatory character of oceanic undulations) the depth of water is too small to admit of their being fully propagated; *secondly*, that waves in strong tides break in deep water during calm weather—a phenomenon which is apparent to the eye and familiar to all sailors; *thirdly*, and negatively, that to leeward of those races which produce broken water, and which certainly do not reflect the incoming waves, there is comparatively smooth water both at sea and on the adjoining shore until the strength of the tide is exhausted and the race has disappeared, after which violent action is again fully manifested on the shore. Even a vertical wall, if built of ordinary masonry in courses, must during its formation present to the action of the waves at its unfinished end a sloping or at least a stepped face like a talus wall, but which, unfortunately for its stability, possesses none of the advantages of such a finished work. In short, during the most critical period of the history of every built vertical wall, the face work and hearting are exposed, at the outer end, to the force of breaking waves. At Dunbar the force against the unfinished end of a nearly vertical wall was found by the marine dynamometer to be nearly six times greater than on the face of the finished wall, where the waves were at the time purely oscillatory.

An important advantage of the sloping wall is the small resistance which it offers to the impinging wave, but it should also be borne in mind that the weight resting on the face-stones in a talus wall is decreased in proportion to the sine of the angle of the slope. If we suppose the waves which assail a sloping wall to act in the horizontal plane, the component of their impulsive force at right angles to the surface of the talus will be proportional to the sine of the angle of inclination to the plane, while the effective force estimated in the horizontal plane will be proportional to the square of the sine of the angle of inclination. But if we assume the motion of the impinging particles to be horizontal, the number of them which will be intercepted by the sloping surface will be also reduced in the ratio of the

sine of the angle of inclination, or of the inclination of the wall to the vertical. Hence the tendency of the waves to produce horizontal displacement, on the assumption that the direction of the impinging particles is horizontal, will be proportional to the cube of the sine of the angle of elevation of the wall.

If it further happens that, owing to the relative direction of the pier and of the waves, there is an oblique action in azimuth as well as in altitude, there will be another similar reduction in the ratio of the squares or cubes of the angle of incidence, according as the component of the force is reckoned at right angles to the surface of the pier or in the direction of the waves.

Let f = force of the wave on unit of surface of wall for perpendicular incidence;

f' = force on unit of surface at vertical incidence ϕ and azimuthal incidence ψ ;

then

$$f' \propto f (\sin \phi \sin \psi)^2.$$

The amount of shelter which is produced by a breakwater must be measured by the length of the portion of wave which is either destroyed or reflected by it. The amount of work done by it decreases from the maximum, which is at normal incidence, to zero when the waves come upon it "end on," in which last case it ceases to act as a breakwater at all, unless to the extent due to lateral friction or erosion where there is a wall or a slope on which the end of the waves can break.

If a breakwater be so situated in relation to the coast line that waves may strike obliquely upon its inner or sheltered side, an extension of its length in the same direction will increase the amount of sea intercepted by it. The lengthening of a breakwater may therefore, during certain winds, increase the sea within the harbour instead of reducing it. In such a case the extension should, if possible, be made in a different direction, or a separate breakwater may be brought from the shore so as to shelter the inner side. If these works cannot be undertaken, then an addition to the sheltered space within must be provided in which the waves can spread, or additional slopes be provided on which they can break.

The table of the principal proportions of some of the most remarkable breakwaters given on p. 460 may be found useful as a guide in designing works of a similar kind.

The following costs of different breakwaters are from the minutes of the Institution of Civil Engineers and other sources:—

Name of Breakwater.	Depth of Water in Fathoms.	Cost per Lin. Foot.	Cost per Lin. Yard.	Remarks.
Joliette, Marseilles	5 to 6	72	215	Convict labour. No rubble, all large broken blocks.
Marseilles (new)...	5 to 6.6	109	328	
Portland.....	8 to 10	116 to 120	348 to 360	
Algiers.....	6 to 9	122	366	
Holyhead	3 to 7	about 163	480	
Alderney	3.3	170	510.	
Plymouth	6.6 to 7.5	200	600	
Dover.....	6.6 to 8.3	360	1080	

Although some of these prices have given rise to lengthened discussions as to the comparative economic advantages of the various designs, the results have not been of much value, on account of the different degrees of exposure and of depth of water at the various places. The economic values may perhaps be arrived at in a more satisfactory manner, although still but only very approximately, thus:—When x = the price per foot of depth, y = the

Table of principal Proportions of remarkable Breakwaters.

price per lineal foot, and d = the depth in feet at high water, then

$$x = \frac{p}{d}.$$

The results calculated in this manner are arranged in order of their costs in the following table, from which the plumb pier at Dover appears to be by far the most costly:—

Name of Harbour.	Depth in Feet at High Water.	$\frac{p}{d}$
Portland	62	£1.90
Joliette	35	2.06
Algiers	42	3.00
Marseilles (new)	35	3.10
Plymouth	53	3.45
Holyhead	36	4.40
Alderney	37	4.60
Dover	33	9.47

Minard allows for large merchant vessels in harbours of refuge one cable-length, which would give about four vessels per acre. Captain Calver allows three vessels per acre for a small sheltered harbour of refuge. At Cardiff Flats there were at one time 224 vessels anchored as close to each other as they could well be, in an open roadstead, and occupying a space of 560 acres, which would give 0.4 vessel per acre.

Tidal Harbours.

We have hitherto been considering outer breakwaters erected in deep water, and which are constantly exposed to the waves; we now turn to piers and sea-walls which are placed within the range of the breaking surf, and which are exposed to its force for a limited period only, being sometimes left nearly or altogether dry by the receding tide.

In dealing with waves which are admitted by all to exert a true percussive force, the question arises as to how this force may be best resisted—whether by opposing to it dead weight, or a comparatively light structure, the stability of which is dependent on strong fixtures connecting it with the bottom. On this subject the late Mr Alan Stevenson made the following remarks, in relation to lighthouse

towers, but his views are equally applicable to piers and breakwaters:—

“A primary inquiry in regard to towers in an exposed situation is the question whether their stability should depend upon their strength or their weight, or, in other words, on their cohesion or their inertia? In preferring weight to strength we more closely follow the course pointed out by the analogy of nature, and this must not be regarded as a mere notional advantage, for the more close the analogy between nature and our works the less difficulty we shall experience in passing from nature to art, and the more directly will our observations on natural phenomena bear upon the artificial project. If, for example, we make a series of observations on the force of the sea as exerted on masses of rock, and endeavour to draw from these observations some conclusions as to the amount and direction of that force as exhibited by the masses of rock which resist it successfully, and the form which these masses assume, we shall pass naturally to the determination of the mass and form of a building which may be capable of opposing similar forces, as we conclude with some reason that the mass and form of the natural rock are exponents of the amount and direction of the forces they have so long continued to resist. It will readily be perceived that we are in a very different and less advantageous position, when we attempt, from such observations of natural phenomena in which weight is solely concerned, to deduce the strength of an artificial fabric. Another very obvious reason why we should prefer mass and weight to strength as a source of stability is that the effect of mere inertia is constant and unchangeable in its nature, while the strength which results even from the most judiciously disposed and well-executed fixtures of a comparatively light fabric is constantly subject to be impaired by the loosening of such fixtures, occasioned by the almost incessant tremor to which structures of this kind must be subject from the beating of the waves. Mass therefore seems to be a source of stability, the effect of which is at once apprehended by the mind as more in harmony with the conservative principles of nature, and unquestionably less liable to be deteriorated, than the strength which depends upon the careful proportion and adjustment of parts.”

It is a remarkable fact that during a summer gale 14 blocks, each 2 tons in weight, which had been permanently fixed in the Dhu Heartach lighthouse tower by joggles and cement, at the level of 35 1/2 feet above the sea, were torn out and swept off the rock, while the thin panes of crown glass in the lantern of Winstanley's Eddystone tower, which were only about 5 feet higher, resisted the waves for a whole winter. The impact on marine masonry seems

¹ Account of the Skerryvore Lighthouse, by Alan Stevenson, LL.B., F.R.S.E., Edin., 1848, p. 49.

therefore to depend on the relation subsisting between the height of the waves at the place and the height and configuration of the rock itself above and below low water, and perhaps also on the configuration of the bottom of the sea near the rock.¹ While the rock at Dhu Heartach from its height above the sea forms a protection against the smaller waves, it operates as a dangerous conductor to the larger waves, enabling them to exert a powerful action at a much higher level than if the rock had been lower. It is of great importance that these facts should be kept in view, and that the Eddystone should not be regarded as a safe model for imitation at all rocks which are exposed to a heavy sea.

The impact of the waves against the outside of a sea-wall or pier gives rise to four distinct forces, namely—(1) the direct horizontal force, which tends to shake loose, or drive in, the blocks of which the masonry consists; (2) the vertical force acting upwards on any projecting stone or protuberance, as well as against the lying beds of the stones; (3) the vertical force acting downwards, which results either from the receding wave striking upon the toe of a talus wall, or from its passing over the parapet and falling upon the pitching behind, so as to plough it up; (4) the "backdraught," which tends by reaction from the wall to remove the soft bottom, and in this way to undermine the lower courses or to suck loose stones out of the work.

It may be concluded from the above that the points which require to be most attended to are—the contour and quality of masonry of the wall itself; the parapet, which if not of proper form, or of insufficient height, leads to damage in the pitching behind it; and lastly, the foundation-courses, in the design and construction of which, if similar precautions be not attended to, underwashing of the bottom may take place, so as to leave the lowest courses without protection.

Within the masonry, as well as without, the waves exert force in the following different ways:—(1) by the propagation of vibrations produced by the shock of the waves on the outer or sea-wall, through the body of the pier to the inner or quay-wall; (2) by the direct communication of the impulses through the particles of the fluid occupying the interstices of the hearing, so as to act against the back joints of the face stones of the inner quay; (3) by the sudden condensations and expansions of the air in the hearing, so as to loosen, and at last to blow out, the face stones of the quay; combined with (4) the hydrostatic pressure of the water, which is forced through the sea-wall, and, from want of free exit, is retained and acts as a head at the back of the quay, and which, however small in quantity, will, as in a Bramah press, act with equal force upon all surfaces exposed to its pressure, however large those surfaces may be. The last three causes are probably the most efficient agents in the work of destruction.

From a comparison of different piers in the German Ocean where we have most examples, and from careful consideration of the other data, it appears that vertical piers, fully exposed to the ordinary waves of that sea, should be not less than from 35 to 45 feet broad at the level of high water. Of course this remark does not apply to anomalous cases where waves are exceptionally high, but, as already stated, to works exposed to the ordinary waves.

The positions in which the piers are to be placed depend on the nature and configuration of the shore and of the

bottom. After a correct plan, with soundings, has been obtained, the next step is to lay down contour lines of the different depths which make the limits of the deep and shoal water at once obvious to the eye. The lines of the piers may then be sketched so as, without disregarding other conditions, to keep the works as much as possible on the shoal ground, while they at the same time enclose the greatest possible area of deep water.

The entrance should be fixed seaward of every part of the works; and its direction, unless where the internal area is small and the sea very heavy, should if possible be made to coincide with that of the heaviest waves, so that they may run along with and guide vessels into the harbour.

Fig. 7.

The outer pier should in such a case be extended sufficiently far seaward of the end of the inner pier head to give it a free end, as in fig. 7, thus allowing a ship plenty of sea room to shape an easy course before taking the entrance to the sheltered basin of the harbour.

There should be sufficient distance landward of a harbour mouth to allow a vessel, having full weigh on her, to shorten sail. For this Minard recommends that, where vessels of ordinary size require to alter their course in order to reach the inner basin, no circle with a less radius than 200 yards in smooth water should, if possible, be adopted, and it should not be forgotten that a vessel requires a larger radius in turning where the water is shoal than where it is deep.

If the beach consist of travelling detritus, the entrance must be so devised as not to form a trap for the passing shingle. This danger is most to be dreaded on the coasts where heavy waves strike obliquely upon the shore. Finally, there must be a good "loose," so that vessels on leaving the harbour shall be able to shape their course free of rocks or a lee-shore; and Minard very properly remarks that the mouths of harbours should be designed rather to suit the entering, which is far more important, than the exit of vessels.

Preference should generally be given to a pier of horizontal convex outline, or a polygonal form, than to one long straight pier. The principal objection to a straight pier does not, however, extend to cases where the heaviest waves strike upon it obliquely, and roll landwards along the sea-wall. Especial care, however, must in all cases be taken that a sea-work nowhere presents to the sea a surface of concave horizontal outline, or, what is still worse, abrupt faces which form a re-entrant angle, for the waves will then act with an almost explosive violence, the breaking of a free wave being a very different thing from the breaking of a wave confined by a barrier of masonry. While the first may be compared to the harmless ignition of a loose heap of gunpowder, the other resembles the dangerous explosion produced by the discharge of a cannon.

¹ Mr D. A. Stevenson has lately shown that a funnel-shaped depression in the sea-bottom extends from the ocean in the direction of, and nearly as far as, the Dhu Heartach rock, a geological formation which must certainly admit the heaviest class of waves to come nearest to the rock (*Min. of Proc. of the Inst. of Civil Engineers*, vol. XLV.).

It may in some cases be found better, in designing a sea-wall for protecting a sinuous coast, to carry the bulwark straight across ledges of rock which extend landwards, than to follow the line of the high water margin. For although with the straight wall we may have to encounter a greater depth of water and a heavier surf, still with the other we may have to oppose the waves with a wall which has at some places a concave horizontal curvature, by which the force is concentrated and rendered more destructive. Moreover, the straight wall may be considerably shorter than the curved.

The general gradient of a fragmentary beach depends upon the size and nature of the particles, and the force of the sea. The dissimilarity between its slopes near the levels of high and low water arises from a decrease in the force of the waves, caused by their being broken before they reach the high water mark. The great object, therefore, is to design the profile of the wall so as to alter as little as possible the symmetry of the beach. For the reasons already stated, it is plain that unless near high water mark a vertical wall is in most cases unsuitable for a sandy beach. Instead of altering the direction of the wave at a distance from its foundation, the whole change is produced at that very point; and, unless the wall be founded at a considerable depth, its destruction is all but certain. A curved profile will prevent to a considerable extent the danger of reaction, by causing the alteration in the direction of the wave to take place at that part where the wall is strongest, and which is also at the greatest possible distance from the toe or curb course. But a very serious objection to all forms of curved walls, unless the radius be large, is the weakness which results from the use of wedge-shaped facc-stones. The impact of the sea on materials of that form may be compared to a blow directed upwards against the intrados of a stone arch—the direction of all others in which the voussoirs are most easily dislocated. This action can only be resisted by very careful workmanship in the dressing and setting of the backing. Another objection, applicable to all except tideless seas, such as the Mediterranean, arises from the varying level of the surface of the water; for what may be best at one time of the tide cannot be equally suitable at another.

When a wave encounters an obstacle such as a breakwater, the portion which strikes it is either entirely destroyed or reflected seawards; while the portion which is not so intercepted passes onwards, and spreading laterally under lee of the barrier suffers a reduction of its height. From a very few observations in the sea under lee of the breakwater at Wick, and from some experiments made in a brewer's cooling vat by Mr Thomas Stevenson, it appeared that after passing an obstruction the reduction in the height of a wave varies as the square root of the angle of deflexion. When x represents the ratio of the reduced to the unreduced wave and α the angle of deflexion, the formula, which must however, be regarded as only approximate, is

$$x = 1.00 - .06\sqrt{\alpha}.$$

The measurements of the distances of high water mark from the centre of divergence, in sandy bays which are under lee of promontories, seem to show that this formula, or one for a logarithmic spiral, represents the effect of lateral divergence very fairly. Providing the materials of the beach are homogeneous and easily moved, the incursions of the waves into the land will be measured of the forces, all of which become *nil* at the high water mark. The following table shows measurements of the finely curved storm and tide marks traced out on the sandy beach under the lee of the promontory at North Berwick, and the results of the formula.

Angles of Deflexion.	Distances from centre of Divergence at end of Promontory to High Water Mark.	Ratios of Measurements.	Results of Formula.
0°	1150	1.00	1.00
10°	1000	.87	.87
20°	920	.80	.73
30°	810	.73	.67
40°	735	.64	.62
45°	700	.61	.60
50°	675	.59	.58
60°	600	.52	.53
70°	570	.50	.50
80°	555	.49	.46
90°	530	.46	.43

The tranquillity of close harbours with the same exposure depends on the relative widths of the entrance and the interior, the depth of water, and the form and direction of the entrance in relation to the line of maximum exposure. A formula for the reductive power of harbours has been given by Mr Thomas Stevenson (*Edin. Phil. Journal* for 1853).

Where the piers are high enough to protect the enclosed area from the wind, and the width of entrance not very great in comparison with the breadth of the wave, the quay walls nearly vertical, and the distance from the entrance to place of observation not less than 50 feet, then—

$$x = \Pi \frac{\sqrt{b}}{\sqrt{B}} - \frac{1}{50} \left(\Pi + \Pi \frac{\sqrt{b}}{\sqrt{B}} \right) \sqrt{D},$$

where Π = height of wave at entrance, b = breadth of entrance, B = breadth of harbour at place of observation, D = distance from month of harbour to place of observation, x = height of reduced or residual wave at place of observation,—all in feet. If Π be taken as unity, x will be a fraction representing the reductive power of the harbour.

Actual measurements at the harbours of Kingstown, Sunderland, Macduff, Fishercrow, and Buckie gave the mean of observations (which at Buckie alone numbered upwards of 2000) = 2.64 feet, while that of results calculated by the formula gave 2.62 feet.

The size as well as the ratio of widths of entrance and basin must also bear a proper relation to the height of waves to which the harbour is exposed. The formula for the reductive power assumes that the waves after being reduced by lateral expansion shall have time to sink and be ultimately destroyed. But if instead of this they are again reflected towards the entrance, such recoil will destroy the tranquillity of the basin and prevent vessels from answering their helm when taking the entrance. Also where a spending beach which is only partially effective in destroying the waves is formed very near the entrance, it may do little or no good by causing a back wash or recoil wave which will injuriously affect vessels when entering.

As before mentioned, it is essential when the exposure is great that there be either a considerable internal area, or else a separate basin opposite the entrance to the inner basin, for the waves to destroy or spend themselves. Such a basin should, if possible, enclose a portion of the original shore for the waves to break upon, and when circumstances preclude this there should be a flat talus wall of at least 3 or 4 to 1, as recommended by the late Mr Bremner of Wick. Mr Scott Russell has found that talus walls of 1 to 1, or steeper, will not allow the waves to break fully, but will reflect them in such a manner as might in some cases make the entrance difficult or even dangerous of access, and the berthage within unsafe.

The following cases in which traffic has been successfully carried on at quays unprotected by covering piers, may be found useful as a guide:—

At Scrabster the quay is at right angles to a fetch of 6 miles. At Invergordon there is a fetch of 5 miles; at Burntisland, 6; Kilcreggan, 4; Londonderry, 1½; Greenock, 6½; Albert Quay, Greenock, 7 miles. The last two are, however, somewhat sheltered by the low-water banks near Greenock.

Five miles is probably not far from the limit that should be observed, which by the ordinary formula, $h = 1.5\sqrt{D}$, gives a wave of

Reduction of waves by lateral deflexion.

Size of harbour must be proportionate to magnitude of waves

Places where unprotected quays may be used.

3-3 feet; but the formula for distances so short as these would give waves about a foot higher, and in heavy storms perhaps waves not much less than 5 feet may exist, but on such occasional vessels could not safely use the quay.

In order to tranquillize harbours of small reductive power, logs of timber called booms, having their ends secured by projecting into grooves cut in the masonry on each side, are placed across the entrance of the inner basin or dock. From 15 to 25 logs are usually dropped into those grooves, or as many more as will insure close contact of the lowest log with a sill-piece placed in the bottom of the harbour. They are also warped down or fixed with an iron hasp at the coping course, without which precaution the swell is found to enter the harbour from underneath. By this contrivance, which forms a temporary wall, the waves are checked, and completely prevented from spreading into the interior basin.

Twelve-inch booms of pine timber about 33 feet long have been broken at the small fishing village of Mousehole, near Penzance, and elm logs have in consequence been substituted. At Hynish in Argyllshire, booms of the same timber and scantling and 20 feet long have been very frequently broken. The marine dynamometer at this place give $1\frac{1}{2}$ ton per square foot:

Capacity of harbours for commerce. The capacity of commercial harbours for trade varies so much with the exposure and size of vessels, that it is difficult to approximate to the truth. At Ramsgate, for instance, there were found to be about 6 vessels to an acre in the outer harbour, while there were about 14 in the inner and better protected basin, where too there was perhaps a greater proportion of small vessels. In the Scotch fishing harbours the number of boats used to be reckoned at from 85 to 115 per acre; but of late their size has been much increased, and probably not more than from 80 to 90 could be accommodated. The Cornish boats at New Lynn, according to the Channel pilot, vary from 60 to 80 per acre.

Timber structures. The employment of timber in harbour works is of great antiquity. It seems first to have been used in forming boxes which were filled with stones, and at a more recent period in the formation of open frameworks through which the current could pass freely. Vitruvius mentions moles, consisting of timber filled with stones and cement, as having been used by the harbour-builders in his days.¹ The earliest drawing of timber piers that we have met with is that of the ancient port of Dunkirk in 1699, a cross section of which from Belidor's *Architecture Hydraulique* is given in Plate VIII., fig. 4. This kind of structure is still not uncommon on the coasts of the English Channel.

In sheltered bays where a deep-water landing-place is all that is required, and where the bottom is sandy or soft, timber may be employed with great advantage. Even in somewhat exposed situations it can also be used for tidal harbours; but the fatal evil in places where there is no admixture of fresh water is its rapid destruction by marine insects. In the Atlantic Ocean the *Teredo navalis*, and at many places in the German Ocean the *Limnoria terebrans*, which was first discovered by the late Mr. Robert Stevenson at the Bell Rock Lighthouse in 1810, are very destructive of most kinds of timber. Mr. Stevenson found that memel was destroyed by the *Limnoria* at the rate of about 1 inch inwards per annum. He found that greenheart, beefwood, African oak, and bullet tree were scarcely

¹ It was probably to some such work that Horace refers in Oda 1, Book iii.:—

"Contracta pisces æquora sentiant,
Jaculis in altum molibus; hæc frequens
Cementa dimittit redemptor."

A harbour contract dated 1394, in all probability the earliest which has been preserved, appears in the *Registrum Nigrum de Aberbrothoc*—a collection of ancient documents printed by the Bannatyne Club, and edited by the late Professor Cosmo Innes.

attacked, while teak stood remarkably well and locust tolerably well, though suffering at last. Greenheart timber, though not absolutely impenetrable, as appears from Mr. Stevenson's experiments, is the great specific in seas where the worms are destructive. But subsequent experience has proved that on the coasts of Scotland it is, in some cases, readily attacked, and at these places creosoting is of comparatively little use, as the worm manifests no repugnance to timber which has been even very recently impregnated.

In addition to the experiments on timber, twenty-five different kinds and combinations of iron were tried at the Bell Rock, including specimens of galvanized irons. All the ungalvanized irons were found to oxidize with much the same readiness. The galvanized specimens resisted oxidation for three or four years, after which the chemical action went on as quickly as in the others. Although the association of zinc with iron protects, so long as it lasts, the metal with which it is in contact, it must be remembered that this immunity is obtained at the expense of the zinc, the tendency of which to oxidation is proportionally exalted so soon as any part of the iron is exposed.

The important experiments of Mr. Mallet on specimens sunk in the sea showed that the amount of corrosion decreased with the thickness of the casting, and that from $\frac{1}{16}$ th to $\frac{1}{10}$ th inch in depth, in castings 1 inch thick, and about $\frac{1}{10}$ th inch of wrought iron will be destroyed in a century in clear salt water. But there is reason to believe from a cannon ball which was picked up on the shores of the island of Inchkeith that the decay was in that case $\frac{3}{4}$ th inch to the century. Cast-iron gratings periodically immersed by the tide at the Bell Rock lost at the rate of 1 inch in a century. Even when the castings were externally sound their strength was reduced one-half in about 50 years.

In judging of the qualities of different quarries for harbour purposes the importance of a high specific gravity ought not to be overlooked, as appears from the table given on page 464.

The superiority of granite to greenstone is proved by the following experiments on the times required to abrade $\frac{1}{16}$ th inch of each kind of stone, made with the same weights and grinding agents, and with equal cubes of each material:—30 minutes were required for Queensferry (Carlton Nose) greenstone; 40 minutes for greenstone from Barnton near Edinburgh; 60 minutes for Peterhead granite. Mr. Murray of Sunderland also established, many years ago, the superior power of resistance to attrition possessed by granite over greenstone.

Portland cement rubble and concrete, a most valuable material, now very commonly used in Britain as well as on the Continent, may be said to have to a large extent revolutionized harbour building; for it admits of being employed in many different ways, and can, if due care be taken as to the quality of the cement and purity of the sand and gravel, be used with perfect confidence.

The following specification has been followed extensively at different places:—

The Portland cement is to be obtained from the best manufacturers. It is to be ground extremely fine, and is to weigh not less than 115 lb per bushel; and each cargo will, on its arrival at the works, be tested in the following manner. The cement is to be made into small blocks 1 inch square and 8 inches long. After being made, these blocks are to be immersed in water for 7 days and then tested by being placed on two supports 6 inches apart, when they must stand the transverse strain produced by a weight of 70 lb placed in the centre. Slabs or cakes are also to be made and placed in water, and after immersion for 24 hours they are not to show any signs of cracking or any softness on the surface.

The cement is to be tested before any of it is used, and if it be found unsatisfactory it must be removed from the works. When a cargo is landed it must be tested from four different bags, and it must also be tested weekly as the works proceed, and the results forwarded to the engineers. The cement must be brought direct

NOTE.—This table is calculated for sea water of the specific gravity of 1.028 or 64½ lb to the cubic foot.

from the manufactory and kept at the works in a dry and well-ventilated storehouse with dry wooden floor and side walls, properly roofed in and completely protected from the weather.

The concrete to be used is to consist of one part of Portland cement, two of sand, and five of gravel, to be thoroughly mixed with a proper quantity of pure water; after it is deposited, large angular stones are to be added, care being taken that all the stones are completely surrounded by concrete for a thickness of not less than 4 inches. All stones to be clean and quite free from sea-weed or other vegetable matter likely to prevent the adhesion of the concrete. No concrete to be made during frost. The sand and gravel used must be sharp and clean, being perfectly free from clay or earthy matter.

There are different kinds of machines by which the concrete is thoroughly mixed, and a saving of cost effected. In that of Mr Messent the number of revolutions to mix the concrete thoroughly is twelve.

The walls of harbours may be constructed of continuous building of concrete and stones, protected by temporary pilings and close planking. The best mode of keeping out the water, as adopted by Mr Balmer at the duke of Richmond's harbour of Port Gordon, is to make a saw-draft in each plank, and to place a thin plate of iron between the planks. An example of this continuous or monolithic building is shown in Plate VIII., fig. 6.

Mr B. B. Stoney has deposited at Dublin the largest blocks that have as yet been attempted to be moved.

Each block is 27 feet high, 21 feet 4 in. in breadth at base, and 12 feet long in the direction of wall, contains nearly 5000 cubic feet, and weighs 350 tons; and when laid in place 12 lineal feet of the wall is finished at once up to ordinary low water level. No cofferdam, staging, or pumping is required. The superstructure is built in the ordinary method by tide work, and is faced with granite ashlars for the ships to lie against. The blocks are built on land, and after 10 weeks' drying are lifted by floating shears, the barge or pontoon of which is 120 feet long and 48 feet wide, and of this 120

feet 30 form a tank at the aft end; and when filled with water, this balances the weight of the block hanging from the shears at the other end. A block can be raised with the flood tide, and is generally set the following low water.

The late Mr J. M. Rendel introduced the improved and very valuable method of depositing the *pierres perdues* or rubble, which is now generally used in the construction of large breakwaters. This method he employed first at Millbay pier, near Plymouth, in 1838, in a depth of 38 feet, and afterwards, on a still larger scale, in the construction of the breakwaters at Holyhead and Portland.

The improvement consists in depositing the rough materials from stagings of timber, elevated a considerable height above high water. The stones are brought on the staging in waggons, through the bottoms of which they are discharged into the sea. The principle on which these stagings are designed is that of offering the smallest possible resistance to the sea the under structure consisting of nothing more than single upright piles for supporting each roadway. At Wick harbour works, as already stated, it was found that the piles of the staging for depositing the rubble required to be of greenheart timber; but even these were broken in large numbers. The piles were invariably broken by the waves at about the level of high water.

A depth of from 12 to 15 feet under low water was pointed out by Mr Rendel as the level below which the waves did little or no damage to *pierres perdues*. Sir John Rennie indeed considered that there was little or no effect at a fathom and a half. But at Wick, as already stated, the rubble was moved as low as 15 feet, and at Alderney 20 feet.

If the beds of the stones in a sea-wall were polished, the power of resistance would be reduced by about one-fourth, or in other words, roughly dressed materials of three-fourths the weight of polished materials will be equally safe.

There is also good reason to believe that slopes of large *pierres perdues* are preferable to slopes of dressed masonry. The great object to be attained is the maximum amount and uniform distribution of friction.

Piers of cast and of malleable iron are now frequently employed. Examples of these may be seen at Scarborough, Southport, Portobello, and at many other parts of the English coast, and have been found to answer even where there is a considerable sea.

The pier at Southport, described¹ by Mr H. Hooper, is of cast iron, and the mode of sinking the piles was peculiar. The piles proper or lowest lengths of the columns are cast in lengths of 8 feet and 10 feet, and are sunk into the sand to the depth of 7 feet and 9 feet respectively. They were provided with circular disks 1 foot 6 inches in diameter, to form a bearing surface; and, a small hole being left in the centre, a wrought-iron tube 2 inches in diameter was passed down the inside of the pile, and forced about four inches into the sand, a connexion being made by means of a flexible hose between the top of the tube and a temporary pipe connected with the Water Company's mains, and extended as the sinking of the piles proceeded. A pressure of water of about 50 lb per inch was thus obtained, and this was found to be sufficient to force the sand from under the disk. Each disk was provided on the lower side with cutters, which, on an alternating motion being given to the pile, loosened the sand. The piles were gradually lowered, and guided by a small ordinary piling engine. When the pressure of water had been removed about 5 minutes, the piles settled down to so firm a bearing that when tested with a load of 12 tons each no signs of settlement could be perceived. The cast-iron columns are 7 inches in external and 5½ inches in internal diameter. All the piles, to the number of 237, were sunk in six weeks, being at the rate of between 6 and 7 in twenty-four hours.

The Clevedon pier is of malleable iron. Mr J. W. Grover² states that each upright consists of two Barlow rails weighing 80 lb to the yard, riveted back to back, and having a total section for each 100 feet span of 64 inches. They are braced together by diagonal tie-rods from 1½ to 2½ inches in diameter. The lower portions of the piles below low water are of solid wrought iron 5 inches in diameter, shod with cast-iron screws 2 feet in diameter, and were screwed down till a 4½-inch rope passed round 6-foot capstan bars parted with the strain. They penetrated the ground to depths varying from 7 to 17 feet, and though made with a thread of 5 inches in pitch seldom descended more than 2½ inches or 3 inches in a turn. The solid pile-stems are connected with the Barlow rail piles by cast-iron shoes. Where rock occurred holes were jumped, and a 4-inch wrought-iron bar was inserted and secured by a jagged key. A shoe to receive the Barlow rail was fitted and keyed on this, and the remaining space was caulked with iron cement. The length of the longest pile is 76 feet. The level of roadway is 16 feet above extreme high water, and the height above the ground at the pier-head is about 68 feet.

Deposits and Scouring.

Deposits arise from two essentially opposite causes, viz., commotion and stagnation of the water. They are also of different kinds of material:—(1) those lighter matters, such as mud, silt, and fine sand, which are held for a time, in mechanical suspension, and which, as the water approaches stagnation, are gradually dropped in the order of their specific gravity and mass; and (2) those grosser matters, such as different kinds of sand and gravel, which are rolled along the bottom or driven forward with the water by the action of waves and currents. The first-named are deposited on the lee side of piers or groins which obstruct the progress of the waves or currents, while the second accumulate on their *weather* sides. But the amount and the positions assumed by the deposits of the second kind depend on the direction and force of the waves or currents in relation to the foreshore and to obstructions. The amount of deposits of the first kind are little dependent on the direction of the stroke of the waves outside of the basin or sheltered place in which they are deposited.

The preservation of the depth of harbours at a level lower than that of the original bottom involves both uncertainty and expense. Where the deposit is confined to the space between high and low water-marks, the scouring

by means of salt or fresh water is comparatively easy; but where it forms a bar outside of the entrance, the possibility of maintaining permanently a greater depth becomes very doubtful. The efficacy of the scour, so long as it is not impeded by enlargements of the channel, may be kept up for great distances, but it soon comes to an end after it meets the sea. When the volume of water liberated is great compared with the *alveus* or channel through which it has to pass, the stagnant water which originally occupied the channel does not to the same extent destroy the momentum as where the scouring has to be produced by a sudden finite impulse. In the one case the scouring power depends, *ceteris paribus*, simply on the relation subsisting between the quantity liberated in a given space of time and the sectional area of the channel through which it has to pass; while in the other it depends on the propelling head, and the direction in which the water leaves the sluice. Mr Rendel's scheme for Birkenhead was on the former principle, which it must be recollected is only applicable where the soil is easily stirred up.

The first example of artificial scouring in England seems to be due to Smeaton, who used it effectively at Ramsgate in 1779. At Bute Docks, Cardiff, designed by the late Sir W. Cubitt, the access to the outer basin is kept open most successfully by means of artificial scouring on a large scale.

Minard holds that when a channel has to be maintained by regular and habitual scouring, the whole effect is generally produced in the course of the first quarter of an hour. This was made the subject of particular investigation at Dunkirk, where sections of the channel were made before and during the scour, and it was found that there was no alteration in the sectional area after the first quarter of an hour.

Causes of Increase of Height of Waves.

The following causes increase the height of waves in a harbour:—(1) the removal of a spending beach either at the entrance channel or within the harbour by building a quay or talus wall across it; (2) deepening the entrance channel or the basin of the harbour itself,—thus the difficulty of keeping vessels to their moorings at the quays of a harbour increases during flood tide, just as the tide rises and the depth is thereby increased; (3) removal of an artificial breakwater or a protecting point of land or spit of gravel outside of the harbour; (4) filling up side creeks or lateral basins in a harbour or its entrance channel; (5) shortening the distance between the sea and the entrance to an inner basin or dock by projecting the basin or dock farther out from the shore-line so as to bring the gates nearer the sea entrance, or projecting the mouth of a harbour farther seawards; (6) removal of a jetty or filling up an artificial side chamber or converting talus into plumb walls; (7) straightening an entrance channel or an outer side breakwater or walls within a harbour; (8) widening the entrance or the entrance channel; (9) reduction of the area of the basin of the harbour; (10) making smoother the surface of a natural sloping beach either within or outside of a harbour by pitching its surface; (11) lowering the top of a protecting outside breakwater over which the sea breaks; (12) converting an open timber quay into a close quay; (13) lengthening a breakwater so as to intercept a greater portion of the waves which come in certain directions.

II. DOCKS.

Docks are of two kinds, viz., dry or graving docks, and wet or floating docks. The dry or graving dock is a small water-tight chamber, fitted with gates of timber or iron, which are shut against the rising tide after a vessel has

¹ *Min. Inst. Civ. Eng.*, vol. xx.

² *Min. Inst. Civ. Eng.*, vol. xxxii.

entered for the purpose of being repaired. The water below low tide level is pumped out generally by steam power.

The wet dock or tide basin is a large water-tight inclosure, usually several acres in extent, which is also fitted with gates which are closed, not, however, during the flowing but the ebbing tide, so that the vessels lying at the quays within the basin may remain constantly afloat and nearly at the same level while being loaded and unloaded.

In order to extend the time during which vessels can enter or leave a wet dock there are two additional works which are often connected with it: These are the entrance-lock and the outer or half-tide basin. The lock is a narrow chamber of just sufficient length and breadth to admit a ship of the greatest length and breadth of beam that is expected to frequent the port. Such a lock can, in absence of the largest class of ships, accommodate simultaneously three or four vessels of smaller tonnage. Locks are sometimes made with double gates, so that when only one vessel of small size has to enter, she is shut up within a compartment of the lock, by which means some of the water is saved which would have been expended had the whole of the chamber been filled. Shortly after the tide has begun to ebb, and when the gates of the wet dock have been shut, in order to prevent the water from falling too low in the dock, a vessel can still enter or leave by means of the lock. She is first passed into the lock from the sea; and, the lower or sea gates being closed, the sluices in the upper or dock-gates are opened, which raises the water in the lock chamber to the same level as the water in the dock, when the upper gates are opened to let the vessel pass in. Ships leaving the dock after the tide has begun to fall are passed into the lock chamber, when the upper gates are closed and the sluices in the lower gates are opened, until the water in the lock has fallen to the same level as the tide outside, when the lower gates are opened and the vessel goes out to sea. This system of locking is continued so long as the level of the dock is not so much depressed as to affect the loading or unloading of vessels lying at the quays, or until the tide has ebbed so far as to prevent vessels reaching the lock from the sea. At the West Dock, Cardiff, where the level is kept up by fresh water from the river Taff, the gates, in order to suit the rise and fall of the tide, are opened one hour before and about two hours after high water.

Tide basins. The tide basin may be described as a lock of very large dimensions capable of receiving at the same time a considerable number of vessels, which continue to run into it from the sea after the dock gates have been finally closed for that tide. Such vessels can run in, so long as they have sufficient water over the sill of the sea gates of the basin, or until the basin itself is filled with ships. The sea gates are then closed, and the sluices in the upper gates are opened till the water in the basin is on a level with the water in the dock. The ships are then passed continuously into the dock, in a string, one after the other. By means of this arrangement the traffic can be carried on to a far greater extent than is possible with a narrow lock, which has to be filled and emptied for each vessel that enters or leaves the harbour. The late Mr Jesse Hartley of Liverpool was the first to propose half-tide outer basins, as adjuncts to wet docks.

The peculiar advantages of docks are the following. Vessels can be accommodated in the smallest possible space, and are enabled to lie constantly afloat; whereas in tidal harbours, where they take the ground, they are apt to be strained or to have their floors broken. But there are other sources of mischief than this in open harbours, for often, when the tide is ebbing, vessels, unless watched, fall

against each other. In two instances where the bottom, which was muddy, had a considerable declivity, a ship which had taken the ground on the beach near low water mark was actually run down and damaged by another stranded vessel, the warps of which suddenly snapped and freed her from the moorings at the quay, thus causing a collision between vessels both of which were at the time high and dry. Then there is the chafing of the vessel's sides against the quays in exposed harbours where there is a run of sea, and the breaking of warps during stormy weather, or during land floods, where there is a river. The late Mr James Walker stated that at Sunderland damage to the extent of £40,000 was occasioned in a single day by large quantities of ice that came down the river Wear. When a vessel is in dock she can be easily and at all times moved from place to place, and the operation of discharging and loading can go regularly on during all times of tide. Her level, too, is never much affected, so that the cargo does not require, when being discharged, to be hoisted so high as would otherwise be necessary. Timber vessels can be unloaded through their ports into the water at all times of tide, while in harbours which are dry at low water the cargo receives injury by falling on the hard bottom.

From the general description which we have given the following conclusions may be drawn as to the best localities for docks:—

(1) Where the rise of tide is considerable, a dock is more required than where the rise is small. In rivers such as the Clyde and the Foyle, for example, where the tide rises only from 9 to 10 feet, the inducement to construct docks is not so great as at the Mersey or the Bristol Channel, where the tide rises from 20 to 50 feet.

(2) Where the nature of the trade requires ships of great length, which are therefore very liable to injury from taking the ground, a dock is more needed than at places where the vessels are of smaller size, and therefore less liable to be strained when not water borne.

(3) Where the bottom is soft and muddy, there is less need for a dock than where the bottom is hard and uneven, unless where strong currents are likely to burrow out the soft soil so as to make the bottom irregular by forming deep ruts.

(4) Where the harbour is open to the entrance of surface waves of considerable height, or of a ground swell, there is more need for a dock than where there is better protection.

(5) Where there is sufficient fresh water, free from mud or silt, for supplying the basin, a dock will be more suitable than where the supply is from the tide, especially if the sea at the place be much loaded with matter in mechanical suspension.

In designing a dock the first subject to which the engineer must give his attention is the seaward exposure of his proposed work. Of course no precaution is needed on this head if the place be a land-locked bay, or a narrow river or estuary. But if there be a considerable fetch of open sea, the waves generated during gales may be of such height as to endanger the sea gates or to interfere with their being worked in stormy weather. The formula already given at page 457 for short lengths of fetch will be the most suitable for calculating the exposure of docks, where the fetch ought never to be great.

Having calculated by means of this formula the height of waves that may be expected to reach the dock gates, the engineer must then determine whether such waves are too high for the strength of the gates, or for their being properly worked in stormy weather. Now we have unfortunately but few facts on this subject to guide us, and these not very consistent with each other.

Best localities for docks.

Do. South.....	60	2½	Do.
Silloth.....	60	2	Mr Boyd, C.E.

It might at first sight be expected that the strain would increase as the squares of the breadth of the gate, but, owing to the manner in which the forces are distributed, this does not seem to be the case.

Where b = the width of opening of the entrance in feet, and h = the height of the waves at the place, the formula $b = \frac{60}{h}$ may perhaps be regarded as safe; or, where h has not been observed, and D is length of fetch in miles,

$$b = \frac{60}{1.5\sqrt{D} + (2.5 - \sqrt{D})}$$

Should the calculation by the formula give higher waves than are compatible with safety or convenience, the proper course will be to provide an outer harbour or covering breakwater, so as to reduce the height of the waves. For this purpose the formula given at page 462 is applicable. In cases where the course now recommended cannot be adopted, from motives of economy or from other causes, recourse may be had to protecting booms such as are described at page 463. If the traffic be considerable and the interruption caused by the shipping and unshipping of the booms be regarded a formidable objection, the gates may in some cases be protected by fastening together the tops of the mitre posts by chains. Another mode of securing gates against the sea was adopted at Ramsgate by Mr Ramsay, and is stated by Sir John Coope to be perfectly satisfactory. It consisted of the following arrangement:—

“One end of a stout beam or stay of greenheart timber was connected, by means of a massive iron movable joint, to the fore part of each gate, near the middle posts on the inner or basin side, and at about the level of high water of equinoctial spring tides; the opposite end of this beam passed into an opening in the masonry of the side walls of the entrance. The inner end of this beam was supported by a small bogie truck running upon a pair of rails laid in a horizontal plane. On the vertical face of the beam nearest the gate there was a strong toothed rack working into a pinion at the end of a train of gearing, the first motion of which was a screw-and-worm wheel. By means of this gearing the power of the men was communicated to the gate through the beam or stay just described.”

After the engineer has succeeded in designing a dock which is sufficient in so far as the sea is concerned, it may after all not prove safe and convenient if it be exposed fully to the force of the wind, which, acting on the rigging and hulls of the shipping, causes vessels to break their moorings or produces a grinding action of the vessels against the quays. At Sunderland south dock and at the docks in the Tyne, for example, the gales of October 1863 occasioned very considerable damage, from vessels breaking adrift from their moorings and coming into collision with other vessels.

The number of vessels that can be accommodated in each acre of a harbour may be termed its “available capacity.” This must obviously vary with the sizes of the craft which frequent the port and with the ratio of sheltered to unsheltered acreage; or in other words, with the exposure, depth, and reductive power. It will therefore be highest for a dock with gates, less for a tide-basin into which the waves have access, and least of all for an anchorage breakwater or roadstead. But it also depends on the form of the basin and on its depth.

The following table contains the greatest number of vessels that can be accommodated at one time per acre for several docks:—

Name.	Tonnage of Vessels.	Number of Vessels per Acre.	Authority.
Ardrossan.....	100 to 1000	15	Mr Moffat, C.E.
Avonmouth.....	2000	0.75	Mr Brunkees, C.E.
King's Lynn.....	1500 aver.	6	Do.
Silloth.....	50 to 800	7.50	Mr Boyd, C.E.

If n represents the number of vessels per acre, and t their average tonnage, and a is a coefficient which may be taken at from 3 to 4 according to the tonnage inversely, the formula $n = \frac{1000}{t} + a$

may perhaps be convenient for showing, though necessarily in a very approximate way, the relative capacity for mixed shipping of proposed docks of symmetrical proportions. But the capacity will very largely depend on whether both large and small vessels frequent the port, or only vessels of one size.

The capacity for tonnage per acre is shown in the following table:—

Name	Depth of Water in Feet.	Tonnage per Acre at one time.	Tonnage shipped and unshipped per Acre per annum.	Authority.
Ardrossan....	18½	3400	90,000	Mr Moffat.
Belfast.....	22	3074	40,307	Mr Salmund.
King's Lynn	25	9000	22,650	Mr Brunkees.
Silloth.. ..	22	6000	40,719	Mr Boyd.

The general form of a dock will in most cases be dependent on local peculiarities. Where the nature of the ground and other circumstances admit of it, the width of the basin should, in order to provide for the largest amount of traffic, be greater near the entrance than at a distance from it. The diagram (fig. 8) may perhaps be regarded as an approach to the form of maximum capacity which should be kept in view as a general guide in making a design. But in most situations the form will, as we have said, be mainly if not entirely dependent on the outline of the land and depth of water, on the position of adjoining streets and buildings, and on the geological formation and nature of the subsoil. The serrated outline of the jetties shown in the diagram affords a larger amount of accommodation for

Fig. 8.

shipping than when the quays are continuously straight. Sir John Hawkshaw was, we believe, the first to adopt these indented jetties, which are specially suited for the coal trade; but the radiating form shown in the diagram has not, so far as we know, been adopted. Not only are numerous cross sections of the ground required for fixing on the best site for a dock, but borings of the subsoil are essential, as, upon a careful comparison of these, the position of the entrance must be determined. It is always of the greatest importance to place the foundations of the lock or entrance gates at a place where the bottom is rock, or, where that is not to be found, on the hardest and most impervious part of the subsoil, or, failing that, on a place where the bottom, though soft, is of uniform consistency.

Mr Ure, in a report on Glasgow harbour, gives the following table showing the amount of work per yard per annum:—

Port	Tonnage per Acre of Water.	Tonnage per Lineal Yard of Quay.	Remarks.
Glasgow, including steamers.	30,670	440	Fully worked.
Glasgow, excluding steamers.	20,361	293	
Southampton Tidal Harbour.	20,000	350	Could do more.
Liverpool Docks.....	21,200	185	Fully worked.
Hull Docks.....	19,000	143	During 9 months.
St Catherine's Docks.....	20,500	112	Fully worked.

A great increase in the amount of trade, with the same size of dock and length of quay, may be effected by Sir William Armstrong's patent hydraulic machinery. This principle of applying hydraulic pressure for opening gates, bridges, and sluices, or to the capstans for hauling vessels out and into dock and waggons on and off the coal tips, and for turning them on the turntables, the discharging of ballast and loading of coals, and the shipment and discharging of general cargoes, has now been successfully adopted at many harbours. Its use is, however, only warrantable where there is a great amount of traffic, and especially at places where the spring tides remain only a short time at the same level.

At the Victoria Docks, London, the late Mr Bidder mentions that 41 craft and 17 ships, or 11,711 tons, came in at one tide. In one month the number of craft entering the harbour was 1229; craft leaving, 1288; ships entering, 250; ships leaving, 258; or an aggregate of 2517 craft and 508 ships during the month. The gates, which are 80 feet span, are opened in less than 1½ minutes. At Sunderland the accumulators are equivalent to a head of 600 feet, and the engine is 30 horse-power. A wrought-iron bridge 16 feet wide, and including counterweights equal to nearly 200 tons, is raised vertically 18 inches, and drawn back in about 2½ minutes. At Swansea the accumulators are equivalent to an effective pressure of 750 lb per square inch, and there are three high-pressure engines of 80, 30, and 12 horse-power respectively. The time employed in either opening or closing the gates is about 2½ minutes, which is the shortest period consistent with safety. The wrought-iron swing-bridge can be opened or shut in 1½ minutes. The ballast cranes, which are distributed round the dock, can each discharge from 350 to 400 tons in the day. The quantity of coal that can be shipped is about 1000 tons per day, and the effective quantity of water required for the port is 21,050 cubic feet per week. The large new bridge at Leith, designed by Messrs Rendel & Robertson, and worked by the Armstrong apparatus, is 120 feet span,—length of girder 214 feet, weight moved 750 tons,—and is opened in 1½ minutes. The saving of time effected by this method is very great, for at Liverpool, according to Mr A. Giles, gates of 70 feet require 20 minutes, and six men on each side to open them.

The proportion of water area to length of quays will obviously depend on the form of the docks. The following table, deduced from information kindly supplied by Mr Lyster, C.E., gives examples on this head at Liverpool:—

Total Water Area and Quay Space at Liverpool and Birkenhead.

	Water Area.		Lineal Quayage.		Lineal Yards of Quay per Acre.	
	Acres.	Yards.	Miles.	Yards.	Yards.	
Liverpool Docks.....	252	1601	17	1472	124.4	
Liverpool Basins.....	16	4441	1	1088	168.3

Birkenhead Docks.....	159	4585	9	110	99.7	
„ Docks and Basins	164	2538	9	779	101.0	

In order to utilize the area of a dock to the best advantage, a certain amount of land space dependent on the kind of trade should be provided around it; for without this space, which is needed for giving room for railway sidings, warehouses, and the like, the traffic would be cramped. As an illustration of the large extent of railway which is required in a coal-port, we may refer to Cardiff, where Mr M'Connochie says, "The extent of sidings provided and maintained by

the Bute trustees, in connexion with the docks, amounts to 16 miles in length, the whole of which is at times fully occupied."

The proportion of the area of outer tide basin to that of the dock to which it forms the access varies necessarily with the requirements of the trade, as is shown in the following table:—

	Dock.		Outer Basin.		Ratio.
	Acres.	Acres.	Acres.	Acres.	
Bute Dock (East)	42.33	2.15	19.69	1	19.69 : 1
Bute Dock (West)	16.86	1.40	12.04	1	12.04 : 1
Penarth Dock	17.11	2.68	6.39	1	6.39 : 1
Tyne Dock	50.	9.50	5.27	1	5.27 : 1
Liverpool generally.....	107.	13.	8.23	1	8.23 : 1

The level of the bottom of a dock is always kept lower than that of the sill of the entrance gates, in order to admit of a certain amount of deposit taking place without injuriously affecting the depth of water in which the vessels lie, or interfering with the working of the gates. There should never be less than 1 foot of greater depth over the bottom of the dock than over the entrance sill.

The commercial advantage of a great depth of water over the sill has been well shown by Mr George Robertson in his report on the Albert Dock at Leith. By increasing the depth to the extent of 2 feet he found there would be 396 tides in the year giving a depth of 23 feet over the sill, as against only 102 tides in the year when that depth could be had if the sill were only 2 feet high. But besides the advantage of availing ourselves of a greater number of tides, Mr T. Stevenson found, from an examination of the draughts and tonnage of a large number of sailing vessels, that the commercial advantages in a navigable river, dock, or harbour are proportional to the cubes of the depths.

The relation subsisting between the depth of a dock or channel and the tonnage of sailing vessels which can use it is given by the formula $t = .13d^3$, or $d = \sqrt[3]{7.7t}$, from which the following table has been calculated:—

Feet.	Tons.	Feet.	Tons.	Feet.	Tons.
5	16	12	225	19	892
6	28	13	286	20	1040
7	44.5	14	357	21	1201
8	66.5	15	439	22	1384
9	95	16	532	23	1581
10	130	17	639	24	1797
11	173	18	758	25	2031

In fixing the minimum width that will admit vessels of the size which are expected to trade at the harbour, the engineer must take care to preserve a proper relation between the area of the dock and the width of the entrance for if this relation be neglected, a current may be generated through the entrance when the tide begins to ebb, which would be incompatible with the safe working of the gates. A very small current is sufficient to act injuriously in this way, especially if the gates be of great width. Whenever the internal area of the proposed basin is considerable, it will be a safe precaution to calculate the velocity of the outgoing current, at different periods of time, after the tide has begun to ebb; and for this purpose observations of the fall of the tide must be carefully made and compared with the proposed transverse sectional area of the passage through the lock chamber. If the velocity thus obtained be thought too great for the safe working of gates of the size required, the only alternative is to provide an additional lock. But a double outlet will at any rate be in all probability needed, or will at least prove a great convenience in all cases where a large internal basin is required.

The late Dr Rankine in his *Manual of Civil Engineering* gives the following table for the expenditure of water due to the passage of vessels through the lock :—

Let L denote a lockful of water, that is, the volume contained in the lock chamber between the upper and lower water levels, and B the volume displaced by a ship, then the quantities of water discharged from the dock are shown in the table. The sign — prefixed to a quantity of water denotes that it is displaced from the lock into the dock.

Single Lock.	Lock Found.	Water Discharged.	Lock Left.
A descending ship	Empty.	L - B	Empty.
Do. do.....	Full.	- B	Full.
An ascending ship.....	Empty or full.	L + B	Full.
2n ships descending and ascend- ing alternately.....	Descending full. ascend- ing empty.	$\left. \begin{array}{l} n L \text{ and} \\ (n+1)L \end{array} \right\}$	Descending empty, as- cending full.
Train of n ships descending.....	Empty.	$n L - n B$	} Empty.
Do. do.....	Full.	$\left\{ \begin{array}{l} (n-1)L \\ - nB \end{array} \right\}$	
Train of n ships ascending.....	Empty or full.	$n L + n B$	Full.
Two trains of n ships—the 1st descending, the 2d ascending	Full.	$(2n-1)L$	Full.

From these calculations it appears that ships ascending and descending alternately cause less expenditure of water than equal numbers of ships in train.

The level of the surface of the water in a dock will of course sink in proportion to the number of times the lock has to be filled during each tide, and may also be affected to a small extent by leakage. In order to provide for this depression of level, the old dock of Grimsby, and also the Bute Docks, Cardiff, are supplied by land streams, while at Penarth Sir John Hawkshaw was unable to get a supply of pure water, and the dock at that port is supplied from the tide water of the Bristol Channel, which holds in suspension a large amount of alluvial matter. In the old London docks the level is kept up by pumping.

If the masonry of the walls has been properly constructed, and if the gates and lock are kept in proper repair, and especially if the basin be of large area, the depression of the water level due to leakage, will, as appears from the following table, be comparatively trifling :—

Name of Dock.	Area in Acres.	Leakage.	Authority.
Ardrossan.....	4	18 in. per tide.	Mr Moffat, C.E.
Belfast.....	3½	$\left. \begin{array}{l} \text{At first 1 to 2 in.,} \\ \text{now 6 in. springs,} \\ \text{and 4 in. neaps.} \end{array} \right\}$	Mr Salmond, C.E.
Whitehaven....	4½	3 in.	Mr Brunlees, C.E.
Avonmouth....	16	¼ in. in 24 hours.	Do.
King's Lynn....	6½	1½ in.	
Silloth.....	4	12 in. per tide.	Mr Boyd, C.E.

The principal works required in the construction of docks are—*first*, cofferdams for excluding the tide, and pumps for keeping the basin dry while the works are going on; *second*, excavation of the basin and lock pit; *third*, piling for the foundations of quay walls and lock, where the bottom is soft; *fourth*, the building of the quay walls, lock, and outer tide basin; *fifth*, entrance gates, gangway, and dolphins in the channel outside of the dock for facilitating the entry and departure of vessels.

As to the *first* of these works, namely, the cofferdam and pumping apparatus, reference is made to the articles on these subjects in this work; and as to the *second* and *third*, there is nothing requiring special notice, as no peculiarity attaches to the mode of carrying on excavation or piling for docks more than for any other engineering undertaking where these are needed. It is only necessary to point out that when the bottom is soft a large amount of piling is required, more especially at the lock pit, where rows of sheeting piles should be driven across the lock, at least at the entrance, and in the lines of the dam or pointing sills against which the gates shut.

The *fourth* class of works, namely, quays and lock, are in all cases most important features in a dock. Dif-

ferent rules have been given by engineers for the proportions of quay walls. Mr A. Giles recommends that they should be made strong enough to resist the pressure of a head of water equal to their own height; and Minard recommends their thickness at bottom to be $\frac{1}{10}$ th of their height.

The recent use of Portland cement concrete in the construction of harbours has led to its introduction at dock works. In the small dock erected in 1875 at Berwick-on-Tweed, Messrs Stevenson had the dock walls and gate chamber constructed entirely of Portland cement concrete, excepting a small portion at and above the high water level, against which the vessels might rub; and Mr Rendel at the new Victoria Docks, London, which are the longest in the world, is making the whole masonry of cement concrete.

Graving docks are basins sometimes 600 feet long and 60 or 70 feet wide, fitted with gates, from which the tide-water which floats the vessel into the dock is pumped out, so as to let the carpenters get access to the ship's bottom. The sides of graving docks consist of a series of steps of masonry, called "altars," against which small timber props, generally of Gulf of Bothnia timber, are placed, for supporting the vessel's sides as she ceases to be water-borne. Her keel is supported on blocks, generally of hard wood, but of late years they have in some places been made of cast iron. The sides, in order to save pumping, are in some places made of a curved form, so as to suit the shape of the vessel's sides. The advantages are, however, more than counterbalanced by the undue contraction of the space allotted for the carpenters, who are unable to move about easily on the sloping surface of the masonry.

Of all the different kinds of masonry which enter into the construction of marine works, there is none which requires greater accuracy of workmanship, or more careful circumspection, than the graving dock. Leakage in a wet dock, provided it does not originate at a place where it is liable to increase through time, and is of no greater extent than to depress the surface of the water a few inches, cannot be regarded as a serious evil. But in a graving dock, where the requirements are different, there should be no leakage. A very little water, accumulating on the platform of a dry dock, interferes to a serious extent with the comfort and convenience of the carpenters. Although it may occasion considerable additional expense, there ought to be in all cases, especially where the soil is full of springs, an ample underground storage provided by a system of drains for receiving the leakage, which can then be pumped out periodically, as required, without ever allowing the water to rise above the platform.

Mr G. B. Rennie's docks are stated to be the first of the kind that have been made of iron. They consist of floating caissons for holding the vessel to be repaired. They are sunk by allowing them to fill with water, and are raised by pumping. The caissons are made with water-tight compartments, and they are carried up as high as the vessel's bulwarks, excepting that through which the vessel enters and leaves. Among several advantages that have been claimed for this kind of dock may be mentioned—its independence of the rise and fall of the tide, the power of applying breast shores as in an ordinary graving dock, and the stiffness produced by the side walls. As the upper parts of the side walls or altars are always full of air, this dock may be used in deep water, and is therefore independent of the nature of the bottom.

Mr Edwin Clark's hydraulic lift, at the Victoria Docks, London, consists of a pontoon which is filled with water and sunk between two rows of iron columns. After a vessel has been floated and steadied upon the pontoon, the whole is raised by twelve hydraulic force-pumps of 2 feet diameter, acting on the pontoon by means of chains. After the

Mr G. B.
Rennie's
floating
dock.

pontoon has been brought about the tide-level, the water is allowed to escape, when there is sufficient floating power to admit of the whole being removed to any place where the repairs can be conveniently made. The pontoons, which can accommodate vessels of a length of 350 feet, are about 320 feet long and 59½ feet broad. "The power of the hydraulic lift is 6400 tons. The largest pontoon will carry a dead load of 3200 tons in addition to its own weight."

Slips are the contrivance of the late Mr Thomas Morton of Leith, and consist of a carriage or cradle working on an inclined railway, falling generally at the rate of about 1 in 17, and extending above high water to a sufficient distance for the class of vessels which are expected to use them to several feet below the level of low water, and a truck or carriage which moves on it. When the carriage is let down under the water, the vessel is floated above the place, and the carriage is drawn up till the vessel catches it forwards. When the ship is placed truly above the line of the carriage, a powerful crab-purchase at the top of the slip, which is generally worked by steam, is set in motion, and raises the truck and ship out of the water.

The gridiron is a simple framework of timber placed at a level sufficient to admit of vessels being floated above it during the flood-tide, and grounded upon it during the ebb, and when thus left high and dry the vessel's bottom can be examined to ascertain if it be necessary to take her into the graving dock, and trifling repairs can also be made. The gridirons at Liverpool vary from 25 feet to 36 feet 3 inches in breadth, and from 228 feet 3 inches to 313½ feet in length.¹

Hydraulic and screw docks. The hydraulic and screw docks used in America are chambers into which vessels are floated during the flood-tide, above a cradle which is drawn up above the high water level, either by means of Bramah's press worked by a steam-engine, or by a powerful apparatus of screws.

Relative advantages of slips and graving docks. The patent slip possesses the following advantages over the graving dock. (1) The cost of its construction is less. (2) When the fall of tide is languid, a vessel can generally be more quickly laid dry. (3) When so laid dry she can be more easily examined, and, from the duration of the daylight being greater than in a deep graving dock, the time in which work can be done is considerably extended during winter. (4) There is more perfect ventilation, by which the vessel's sides are sooner dried, which is of some moment with an iron ship. (5) A vessel can be hauled up long before high water, and the repairs can be begun at once; whereas with a dock the pumping occasions considerable delay. (6) While the upper part of the slip is occupied, an additional vessel may be taken up for a shorter time than its predecessor, without interrupting the workmen.

The advantages afforded by a graving dock, on the other hand, are these. (1) Although its construction is more costly, it is nevertheless, if properly built, unquestionably a more durable structure—the rails, rollers, carriages, and chains connected with the slip being liable to derangement, which entails occasional repair. (2) The management of the graving dock is simple, and involves comparatively little superintendence; whereas that of a slip is intricate, and requires more than mere nautical skill. (3) The working of a graving dock is equally simple for large or small vessels, while it is undeniable that the raising of a large vessel on a slip is a delicate operation, and should be attempted only under the direction of persons thoroughly versed in such matters, and having ample mechanical resources at command. (4) The graving dock possesses the advantage, which is sometimes important, of affording the means of more easily filling a vessel with water, so as to detect leaks which may not be discoverable by other means. For this purpose a

¹ "Historical and Descriptive Sketch of the Mersey Docks and Harbour," by J. J. Rinckel, in the *Artisan* for 1864.

nozzle to receive a flexible tube should be fixed into the dock-gates. (5) Where double gates are provided the water contained in the dock affords a certain limited power of scouring the forebay and entrance, an advantage which is of course not possessed by a slip. (6) In any rapid land current, or strong tideway, it is a much easier process to dock a vessel than to land her safely on the cradle of a slip—an operation which, when incautiously gone about, has been in some cases attended with serious consequences even in sheltered situations. (7) The graving dock need not interfere with the set of the currents, whereas a slip which projects a long way seaward of low water may deflect them and produce shoals in the channel. (8) Mr Mallet has remarked that the strains on a ship's timbers are more direct than when she is on a slip, especially when she is leaving the cradle. The late Mr J. M. Balfour suggested, in order to meet this objection, that the cradle for a slip might be made of a wedge shape, so that its upper surface shall be parallel with the horizon, or that the back end should even be tilted slightly, so as to give a bite on the vessel and prevent her from slipping.

The relative advantages of the other contrivances for the repair of ships already described may be judged of by comparing them with each other in a similar manner.

Mr P. W. Barlow has given the following formulæ for the strength of dock-gates:—

Formula for Straight Gates.

If ϕ = horizontal angle (or "sally") between pointing sill and line joining heel-posts of the two leaves; W = pressure on the length of the gate with any head and for a given depth of the gate; and S = hole transverse strain at angle ϕ ; then

$$S = \frac{1}{2} W \sec \phi + \frac{1}{\sqrt{3}} \cos \phi.$$

From this Mr Barlow has deduced that the salient angle, where the strain is the minimum, is 24° 54', but as the length of the gate increases with the secant, the strength will not at this angle be the greatest with a given section of timber. The "sally" or angle which gives the greatest strength, with a given section of timber, is stated by him as 19° 25'.

Formula for Curved Gates.

When θ is the salient angle, or camber of the beam, formed by a chord line drawn from the heel to the mitre-post, with the tangent to the curve of the gate—

$$S = \frac{1}{2} W \left\{ 1 - \frac{\sin \theta}{\sin (2\phi - \theta)} \right\}.$$

There is great difference of opinion among engineers as to the strain to which dock gates are subjected, and the reader is referred for further information to the 18th and 31st volumes of the *Minutes of Proceedings of the Institution of Civil Engineers*. In these discussions Mr Brown pointed out an error in Mr P. W. Barlow's paper, which stated that the line of pressure at the mitre-posts would always be a tangent to the curve of the separate gates, whereas that line must always be at right angles to the centre line of the lock, and could only be a tangent to the curve when the two gates formed a segment of a circle, or, as Mr Bramwell says, at all events when their junction at the mitre-posts formed at that point part of a continuous curve. Mr Brown gives elaborate formulæ suited to meet a yielding or deflexion of the structure, which he alleges must always take place. Mr Bramwell states, and we think justly, that, when the gates form when closed a segment of a circle, they cannot be subject to transverse strain, and that the whole of the gates would be subjected simply to compression. Mr R. P. Brereton very properly suggests that when the gates are of malleable iron the boiler-plate should never be less than ¼ inch thick, whatever the formula may indicate.

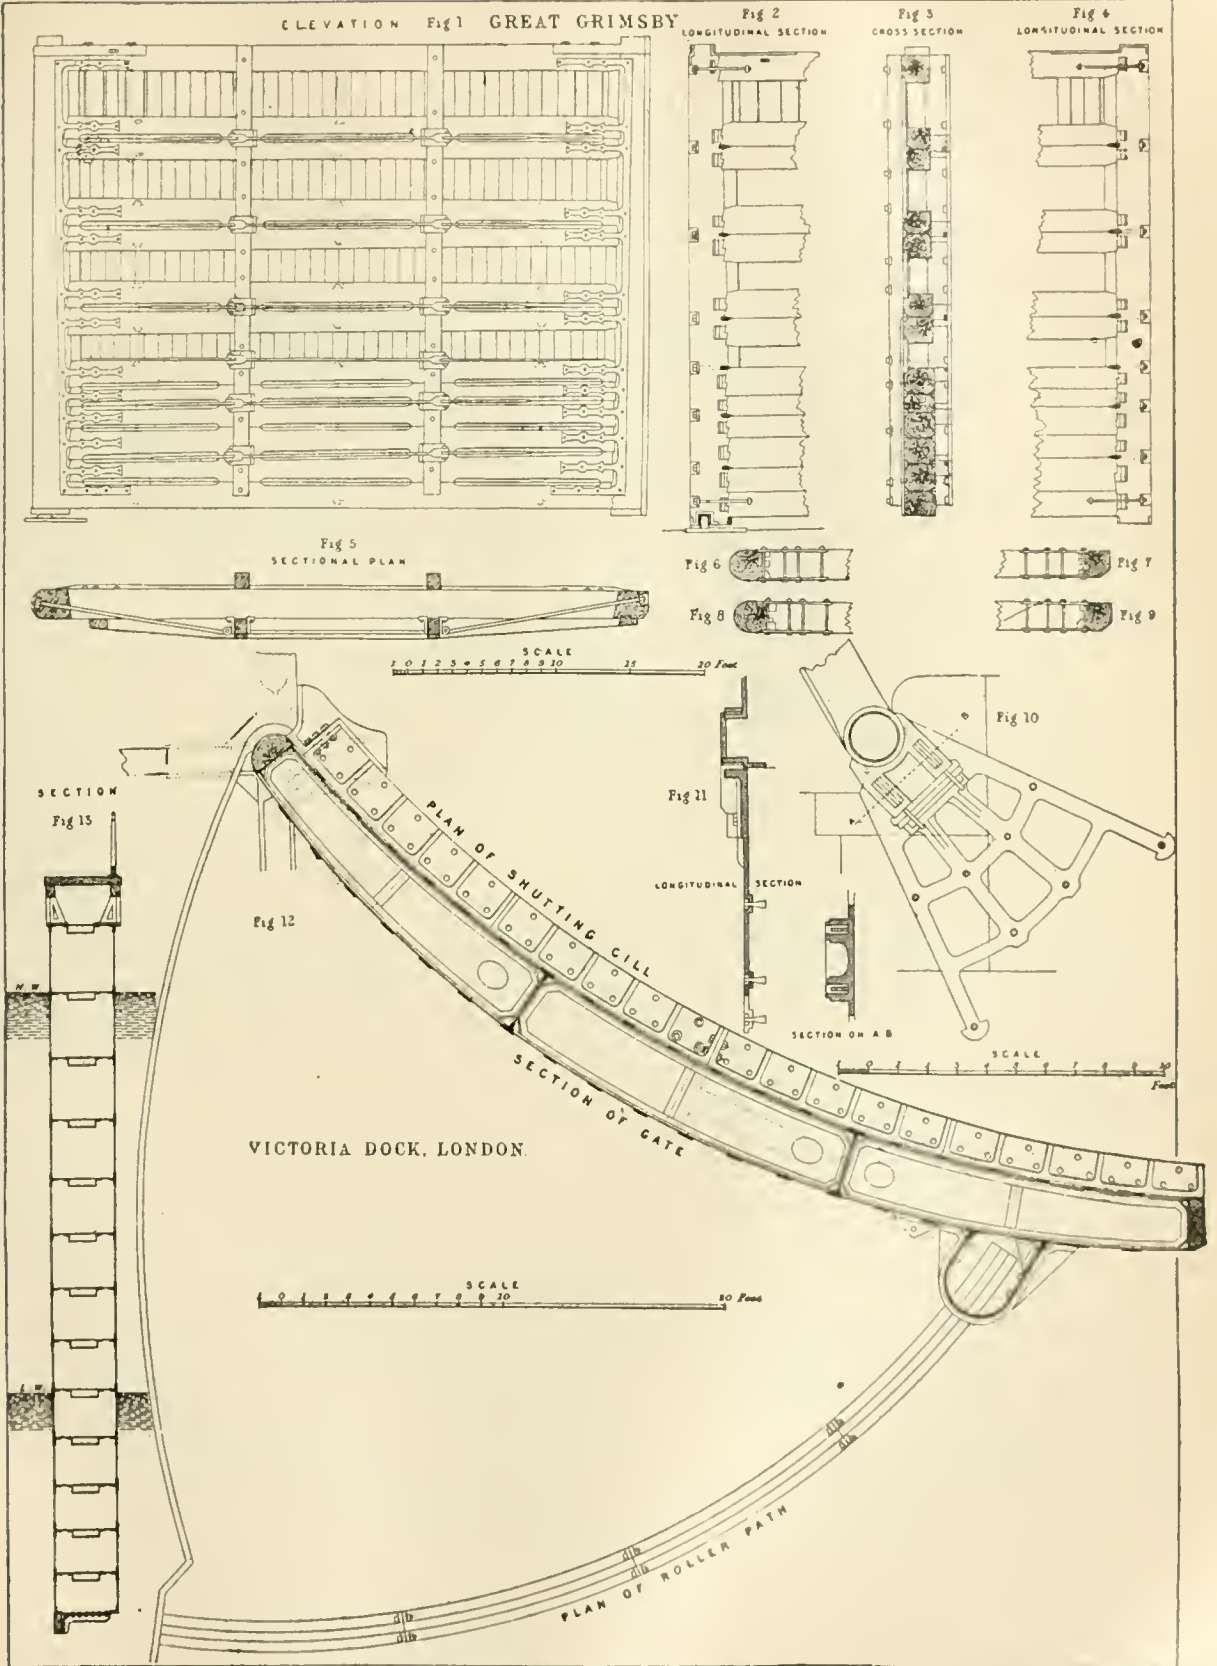

Where l represents the length of one-half of a straight or cambered malleable iron gate, w the distributed pressure over the length of the leaf taken on a given element of the gate, bounded by two horizontal planes 1 foot apart, t the thickness of framework of gate or distance between the two skins, s the transverse strain in middle of gate, θ half of the mitring angle—i.e., the angle formed by meeting of gates—all the dimensions being in feet, and weight in tons,—then

$$s = \frac{\frac{1}{2} w l}{4 t};$$

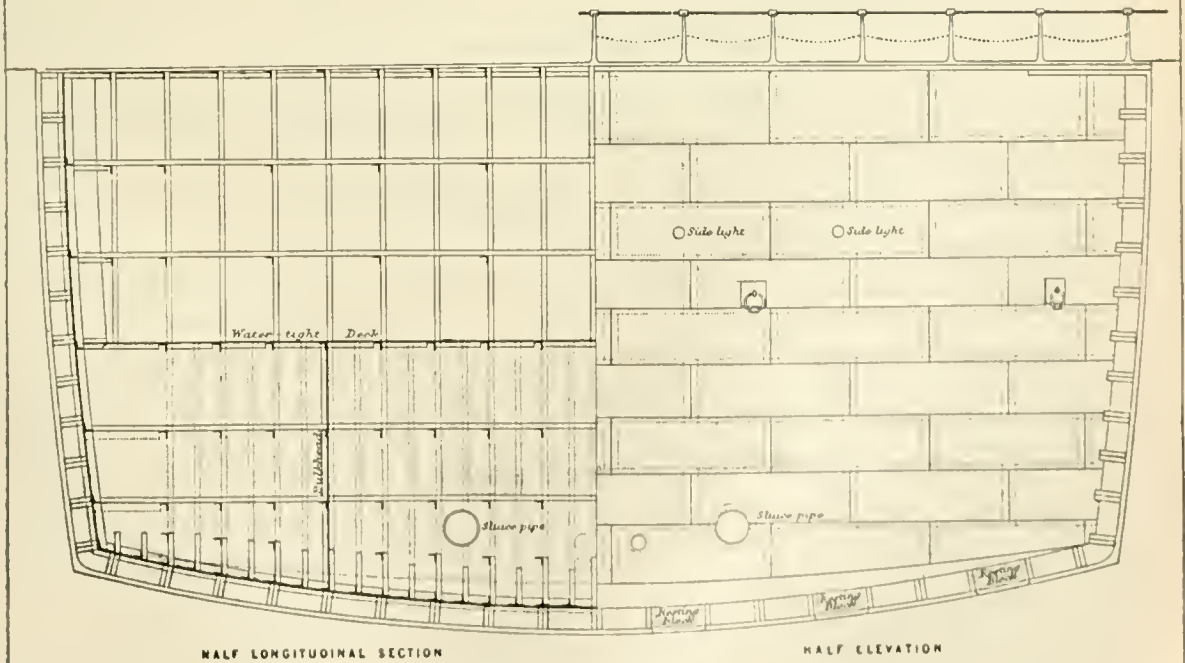

$\frac{1}{2} s$ = sectional area of metal on compressed side in inches;

$\frac{1}{2} s$ do do on extended side do;

$\frac{1}{2} w \tan \theta$ = compressive strain produced by other leaf of gate.

CARDIFF DOCKS
CAISSON FOR GRAVING DOCK

SCALE 1/8" = 10' 0"

Mr Kingsbury adds half of this compressive strain to the strain representing the compression due to the transverse pressure, and deducts it from the same amount for the extension; and these results being divided as before by 4 and 5 respectively, being the allowances per square inch of metal for compression and extension, give the areas for each. Ho, however, expresses a doubt whether the whole of the compressive strain from the other gate may not perhaps come upon the compressed section. The sections close to the posts he takes as requiring to resist the compression due to transmitted pressure only, or $\frac{1}{4} w \tan \theta$.

For cylindrical gates Mr Kingsbury gives the formula,—when p = pressure per unit of surface, and r = radius of curvature,—

$$\frac{pr}{4} = \text{sectional area of metal in square inches.}$$

It must be remembered in designing gates which are exposed to the waves that they should be made stronger than these formulae require. And the gates for graving or dry docks sustain a greater pressure with the same rise of tides than those of wet docks, and should therefore be made correspondingly stronger.

Caissons are sometimes employed instead of gates, and are the invention of the late General Bentham. They are constructed of malleable iron plates and are sometimes made in the form of a ship's hull, and sometimes have vertical sides. The caisson fits into checks made for its reception in the side walls of the entrance to the dock. They require to be very carefully ballasted, and to be most accurately fitted to the masonry on the sides and bottom, and even when they are faced with timber which has been finely dressed and fitted, coal cinders are often needed to make the joints water tight. At high water they are floated into the grooves, and are then scuttled by admitting the water into the interior chamber. When a vessel has to leave the dock, the water is again pumped out, and the caisson is then floated out of its place and taken into the river or harbour, so as to be out of the way of the vessel which is leaving. General Bentham says caissons are cheaper than gates, occupy less room, are more easily repaired, and the same caisson may be used for different places at different times, while they answer for roadways, and require less labour for opening.

The caisson at Keysham was designed by Mr Scamp, deputy-director of the Admiralty works, and is 80 feet wide and 43 feet deep, with an air-chamber at the bottom. When raised a few inches above the bottom, the caisson is drawn back into a recess or chamber in the side walls. The total weight is 290 tons, and the deflexion was $\frac{1}{4}$ inch near the bottom, when the pressure of the whole surface was 2000 tons. The time for opening and closing the entrance at Keysham is 10 minutes and 8 minutes respectively. The cost was about £10,000.

Mr M'Connochie says that the iron caisson at Cardiff is 60 feet long, 26 feet greatest width, and 30 $\frac{1}{2}$ feet deep, with a total weight of 152 tons.

The outer gangway at entrance to docks is generally a structure of open timber work, erected in the line which will best suit the entrance of vessels when under the influence of currents. This gangway is sometimes useful for a vessel discharging her passengers or completing her cargo while the gates are shut. Mr Redman remarks that "the practice in the port of London is to dock a ship upon the flood just before the high water, and to undock her at about the same period of tide. . . . The directions as apparently the most desirable are an angle of about 45° pointing up the streams for graving docks, an angle of about 60° in a similar direction for wet docks, and a right angle for building slips."

It is of importance in discharging coal into ships that the fall should be as small as possible.

At Bramley Moor Dock, Liverpool, the Wigan coal is discharged by railway 18 feet above the quay. At Sunderland Mr Meik finds that 20 feet above the quays, as at the south dock, is too small for the shoots, and prefers 36 feet. At Penarth the height is 23, and they are able to lift 180 tons per hour. At Greenock, where steam cranes are used, they load about 500 tons a day. At Middlesboro' they can discharge 150 tons per hour, but 100 tons are

as much as can be trimmed on board. At Cardiff, where there is no hydraulic machinery, they load 100 tons an hour. The distance between the staiths is 180 feet. At the Tyne Docks, Mr Harrison states that on one occasion, when a vessel had very long hatchways admitting of several waggons being simultaneously discharged, 420 tons of coal have been shipped in 55 minutes, a feat which shows the admirable mechanism employed.

At Swansen, with hydraulic machinery, they can discharge from 350 to 400 tons a day, and those at Penarth load at the rate of 60 tons an hour.

The Law of Harbours and Ports.

The power of appointing suitable places to be ports or havens in England is one of the ancient prerogatives of the crown, founded, as Blackstone thinks, partly upon the rights of the king as conservator of the kingdom, partly upon his interest in the marine revenues. "In England it hath always been holden that the sovereign is lord of the whole shore, and particularly is guardian of the ports and havens which are the inlets and gates of the realm, and therefore, so early as the reign of King John, we find ships seized by the king's officers for putting in at a place that was not a legal port." The right of the king to make a harbour, and to grant the dues arising from the use thereof, in any suitable place, although the ownership of the soil may be in another, is subject to any vested rights of harbour already existing; and in the recent case of *Foreman v. the Free Fishers of Whitstable*, it was said that the right of the public freely to navigate the high seas is a paramount right to which the right of the crown in the soil is necessarily subservient, and therefore, as the right of navigation must include the right of anchorage, the crown or its grantee could not impose a toll on this use of its soil. To justify such a toll some facts must be shown proving that the soil was originally within the precincts of a port or harbour, or that some service or aid to navigation was rendered, in respect of which the alleged right of toll was granted. The crown having once granted a harbour could not afterwards narrow its limits, but by 16 and 17 Vict. c. 107 the crown is enabled to ascertain the limits of all ports, and to assign quays thereon for the enclosure, loading, and landing of merchandize, so that frauds on the revenue may be prevented.

The Act 10 and 11 Vict. c. 27 consolidates the clauses usually inserted in private acts authorizing the construction of harbours; 24 and 25 Vict. c. 45 facilitates the formation and improvement of piers and harbours in Great Britain and Ireland; and 25 and 26 Vict. c. 69 and 28 and 29 Vict. c. 100 transfer from the Admiralty to the Board of Trade certain powers and duties relative to harbours. Besides these general Acts, there are many special Acts relating to particular harbours.

The gates figured in Plate XI. are those at Great Grimsby and Victoria Dock, London; and the caisson, Plate XII., is that in use at Cardiff Docks.

HARBURG, a seaport town of Hanover, Prussia, at the head of a circle in the district of Lüneburg, is situated on the left bank of the southern branch of the Elbe opposite Hamburg, which stands on the right bank of the northern branch of that river. The distance between the two towns is about $4\frac{1}{2}$ miles, and there is railway communication between them by means of a bridge over both rivers, completed in 1871. The town is also connected with Hanover by railway. It is the seat of a local court, a superintendent-general, a head custom house, and a chamber of commerce; and it possesses an old castle, which from 1524-1642 was the residence of the Hamburg line of the house of Lüneburg, a real-school of the first order, a commercial school, and a trade school. The industries include shipbuilding and the manufacture of india rubber and gutta percha wares, oil, soda, starch, alum, cigars, yarn, cast-iron, machines, and leather. There are also horse and cattle markets, and some shipping trade, which, however, has considerably declined since better communication was opened up with Hamburg. In 1878 there entered 469 sea-going vessels with a burthen of 38,110 tons, and 7677 iron vessels with a burthen of 175,643; while the corresponding averages during the previous twelve years (1866-1877) were 633 sea-going vessels and 7669 of iron craft, with burthens respectively of 43,036 and 168,082 tons. Harburg belonged originally to the bishopric of Bremen, and received town rights in 1297. In 1376 it was united to the principality of Lüneburg, along with which it fell in 1705 to Hanover, and in 1806 to Prussia. In 1813 and 1814 it suffered considerably from the French, who then held Hamburg, and who built a bridge between the two towns, which remained standing till 1816. The population in 1875 was 17,131.

HARDENBERG, FRIEDRICH VON (1772-1801), German poet and philosopher, best known as Novalis, was born on his father's estate in the county of Mansfeld, in Prussian Saxony, May 2, 1772. He was of a shy, retiring, and thoughtful disposition, and was deeply influenced by his parents, who were strict members of the sect of Moravian Brethren. After attending the gymnasium of Eisleben he went as a youth of eighteen to the university of Jena, where he studied philosophy, mathematics, and the natural sciences. There he was treated with great kindness by Schiller, of whom he was a warm admirer. He studied law in Leipzig and Wittenberg, and in 1794 settled for a time in Teunstädt in order to perfect himself in the practical work of the legal profession. During his residence in Teunstädt he formed a passionate attachment to Sophie von Kühn, a beautiful but delicate girl of thirteen, and with her consent obtained a promise from her parents that when she reached womanhood she should become his wife. In 1795 he was made auditor at the salt-works of Weissenfels, where his father was director. Two years afterwards his betrothed died, and for some time he seemed to be broken-hearted and to have lost all interest in life. In a few months, however, he went to the academy of mines at Freiberg, where he studied with a view to a higher appointment in connexion with the salt-works; and in the midst of his studies he became engaged for a second time, and was again able to look forward to a happy and useful career. He returned to Weissenfels in 1799, and was associated as assessor with the directorate of the salt-works. As he was preparing for his marriage in the autumn of 1800 he was alarmed by the sudden appearance of blood from the lungs. The wedding was postponed, and although he believed to the end that his recovery was certain, the disease made rapid progress, and he died on the 25th of March 1801. He was of a tall, slight, and graceful figure, with light brown hair and hazel eyes, and a face expressive of a calm, gentle, and meditative spirit. After his death his

writings were issued in two volumes by his friends Ludwig Tieck and Friedrich Schlegel, and were rapidly recognized as important contributions to German literature. They are for the most part composed of fragments, of which the chief is *Heinrich von Ofterdingen*, an unfinished romance. Hardenberg is often spoken of as "the prophet of the Romantic school;" and the phrase sufficiently marks his leading peculiarities. He took no part in the literary warfare carried on by his friends, but he shared to the full their strongest sympathies. Like them he intensely disliked those "enlightened" writers of the 18th century who had claimed to say the last word about human life through mere logic; he was penetrated by the conviction that there are elements in the world which cannot be grasped by the understanding, and which must be felt rather than reasoned about. Although he was fond of science and history, he moved most freely in the borderland between religion, philosophy, and poetry; and his prose writings are full of sayings which, although not easily intelligible, are impressive and stimulating. His diction is often simple and unostentatious, but it is rendered difficult both by the abstruseness of his themes and the remoteness of his allusions. As a poet he lacked definiteness of conception; his lyrics, however, especially those of a religious nature, have a certain tender beauty which gives them high rank in the serious literature of Germany. They are marked by deep feeling and by sweetness and grace of expression. He himself regarded a series of *Hymns to Night* as his best achievement, but it is in *Heinrich von Ofterdingen* that the majority of his admirers find the fullest utterance of his mystic aspirations, his passion for spiritual beauty, and his idealist philosophy.

See his *Schriften* (5th ed., Berlin, 1837; vol. iii., 1846), and R. Hayn, *Die Romantische Schule* (1870), and *Friedrich von Hardenberg* (1873).

HARDENBERG, KARL AUGUST (1750-1822), Prussian statesman, was born at Esselroda in Hanover, May 31, 1750. Having studied at Leipsic and Göttingen, he entered the Hanoverian civil service as chamber councillor (Kammerath) in 1770, and afterwards spent some time in Wetzlar, Ratisbon, Vienna, and Berlin, and travelled in France, Holland, and England. He was made privy chamber councillor (Geheim-Kammerrath) and raised to the rank of count in 1778; but a private quarrel with the prince of Wales compelled him four years afterwards to give up his appointments in Hanover and seek a new career. In 1787 he received the office of president of the board of domains (Kammercollegium) in Brunswick; and he was entrusted with the duty of delivering to Frederick William II. of Prussia the will of Frederick the Great, who had deposited it with the duke of Brunswick. Frederick William II. was so impressed by Hardenberg's appearance and character that in 1790 he recommended him as a minister to the margrave of Anspach and Baireuth. These principalities being united to Prussia in 1791, Hardenberg was appointed a Prussian cabinet minister, but continued to perform his duties as chief administrator of the new province. In the war with the French republic he acted as minister of war, and in 1795 signed on behalf of Prussia the treaty of peace concluded at Basel. When Frederick William III. mounted the throne in 1797, Hardenberg was transferred from Anspach-Baireuth to Berlin, where he received high offices in the cabinet, being also soon afterwards nominated chief of the departments for Magdeburg and Halberstadt, for Westphalia, and for Neuchâtel. At this time the foreign policy of Prussia was determined by Haugwitz, who was on all occasions subservient to Napoleon. When in 1803 Prussian interests seemed to be threatened by the French occupation of Hanover, Haugwitz fell into disrepute, and in the following year his place at the head of the cabinet was

taken by Hardenberg. The latter was anxious to maintain peace, but when in 1805 Napoleon's troops marched through Anspach he strongly protested, and entered into a convention with Russia. The victory of the French at Austerlitz, however, made it difficult for Prussia to proceed to hostilities; and on the 15th December 1805 Haugwitz signed a convention with Napoleon, whereby in return for Hanover Prussia conceded Anspach, Cleves, and Neuchâtel to the French. Hardenberg then retired, and Haugwitz returned to power. The policy of Haugwitz was exceedingly unpopular, and led to the war in which his country was prostrated at the feet of Napoleon. After the battle of Jena Hardenberg undertook the office of foreign minister; but when the treaty of Tilsit was signed he withdrew and watched from a distance the vigorous and enlightened efforts of Stein to restore new life to the fallen and humiliated state. Stein being compelled to retire in 1810, Hardenberg was recognized as the only possible successor of the great minister; and he amply justified the confidence with which he was honoured. The circumstances of the time did not admit of his pursuing an independent foreign policy; but he steadily prepared for the inevitable struggle with France by carrying out Stein's far-reaching schemes of social and political reorganization. The military system was completely reformed, serfdom was abolished, municipal institutions were fostered, the civil service was thrown open to all classes, and great attention was devoted to the educational needs of every section of the community. In the war of liberation Hardenberg was one of those who did most to stimulate the patriotic enthusiasm not only of the Prussians but of all Germans; and so important were his services that on the 3d June 1814, after he had signed the first treaty of Paris, he was raised to the rank of a Fürst or Prince. He accompanied the allied sovereigns to London, was one of the chief plenipotentiaries at the congress of Vienna, and took a leading part in the negotiations which led to the second treaty of Paris. After the restoration of peace he retained his place at the head of the Prussian cabinet, but his conduct of affairs was no longer marked by energy and foresight. He was accused of being too submissive to the papacy, and, although a man of liberal sentiments, he had not the courage to resist his royal master's dislike of constitutional government. He died at Genoa, November 26, 1822.

Hardenberg wrote memoirs of the time between 1801 and the conclusion of the treaty of Tilsit, and entrusted them before his death to his friend Schöll, a councillor of state. They were sealed by Frederick William III. and placed in the state archives, with directions that they should not be published until after the lapse of fifty years. At the end of this time they were entrusted by Prince Bismarck to Leopold von Ranke, who issued them accompanied by a biography of the author (*Denkwürdigkeiten des Staatskanzlers Fürsten von Hardenberg*, 4 vols., 1877). See also Klose, *Leben Karl August's, Fürsten von Hardenberg*, 1851; and Seeley, *Life and Times of Stein*, 1879.

HARDERWIJK, a town of the Netherlands, in the province of Guelderland, on the coast of the Zuyder Zee, about 28 miles N.E. of Utrecht. Its principal buildings are the town-house, the Reformed church rebuilt in the 15th century, the Nassau-Veluwe gymnasium, the colonial dockyard depôt, formerly the mint, and the municipal orphanage. Agriculture, fishing, and a few trifling domestic industries form the sole employment of the inhabitants, who in 1872 numbered 5041.

Formerly the town was much more important. Having been surrounded with walls by Count Otto II. in 1229, and gifted with municipal privileges in 1231, Harderwijk rapidly extended its commerce till it dealt directly not only with Holstein and Hamburg but with England, Denmark, and Sweden. In 1522 the town was captured by Charles V.; in 1672 it became subject to the United Netherlands; and in 1672-73 it was besieged for seventeen months by the bishop of Munster and his French allies.

HARDICANUTE, HARTHACNUT, or HARDICNUT (c. 1018-1042), the last of the Danish sovereigns of England, son of Canute king of England, and his wife Alfgiva Emma, the sister of Richard duke of Normandy, and widow of King Ethelred, was born most probably in 1018 or 1019. When Canute died in 1035 Hardicanute was ruler of Denmark, and Swend, the elder reputed son of Canute by Alfgiva of Northampton, one of his concubines, was ruler of Norway. It is said to have been the wish of his father that Hardicanute should be ruler of both England and Denmark, but his connexion with Denmark seems to have been prejudicial to his English interests; and though his claims were supported by Godwine and the West Saxons, the witenagemot which met at Oxford decided that his government should not extend further north than the Thames, and that Harold, Canute's younger son by Alfgiva of Northampton, should reign over the northern provinces, being also in all probability overlord of the whole kingdom. Hardicanute refused, however, to come to England on such conditions, and in 1039 the witan of Wessex deposed him, and chose Harold also for their king. On the death of Harold in 1040, Hardicanute, who was about to invade England, had his hostile intentions disarmed by the message which reached him at Bruges, making him an offer of the crown for which he was preparing to do battle. The witan's choice of him seems to have been spontaneous, and not at all due to the threatening attitude he had assumed; but apparently he had not forgotten the former slight he had received, and his short reign was marked by great oppression and cruelty. He caused the dead body of Harold to be dug up from its place of sepulture at Westminster, and thrown into a marsh or, according to another account, into the Thames; he exacted so heavy a *danegeld* for the support of his foreign fleet that great discontent was created throughout the kingdom, and in Worcestershire a general uprising took place against the earls sent to collect the tax, upon which he burned the city of Worcester to the ground and devastated the surrounding country; in 1041 he permitted Eadwulf, earl of Northumbria, to be treacherously murdered after having granted him his full friendship. It would appear that Hardicanute was greatly given to excess in eating and drinking; and while carousing at the marriage feast of one of his thegns he was suddenly seized with an epileptic fit, from which he died a few days afterwards, June 8, 1042. He had no children, and though the line of Danish sovereigns might have been continued by Swend, the choice of the kingdom was unanimous for Edward Atheling, son of Ethelred.

See Freeman's *Norman Conquest*, vol. i.; Palgrave's *History of the Anglo-Saxons*; and Green's *History of the English People*, vol. i.

HARDING, JAMES DUFFIELD (1798-1863), a landscape painter, was the son of an artist, and took to the same vocation at an early age, although he had originally been destined for the law. He was in the main a water-colour painter, but he produced various oil-paintings both at the beginning and towards the end of his career. He frequently contributed to the exhibitions of the Water-Colour Society, of which he became an associate in 1818, and a full member in 1822. He was also very largely engaged in teaching, and published several books developing his views of art,—amongst others, *The Tourist in Italy*, 1831; *The Tourist in France*, 1834; *The Park and the Forest*, 1841; *The Principles and the Practice of Art*, 1845; *Elementary Art*, 1846; *Scotland Delineated in a Series of Views*, 1847; *Lessons on Art*, 1849. He died at Barnes on 4th December 1863. Harding was noted for facility, sureness of hand, nicety of touch, and the various qualities which go to make up an elegant, highly trained, and accomplished sketcher from nature, and composer of picturesque landscape material; he was particularly skilful in the treatment of

foliage, and had for many years a leading position among those landscapists who carry on the miscellaneous work of the art to the satisfaction of their own generation, without establishing an ultimate claim to the higher kind of posthumous renown.

HARDING, JOHN. See HARDYNG.

HARDINGE, HENRY HARDINGE, VISCOUNT (1785-1856), field-marshal and governor-general of India, was born at Wrotham in Kent, March 30, 1785. After passing a short time at Eton college, he entered the army in 1798 as an ensign in the Queen's Rangers, with whom he served in Canada. In the Peninsular War he served for a time on Wellington's staff, and received an appointment as deputy-quartermaster-general in the Portuguese army from Marshal Beresford, whose approval and subsequent influence he had won by his gallantry at Corunna in 1809. Hardinge was present at nearly all the battles of the campaign; he was wounded at Vimiera and Vittoria. At Albuera he saved the day for the British by taking the responsibility at a critical moment of ordering General Cole's division to advance. When peace was again broken in 1815 by Napoleon's escape from Elba, Hardinge hastened into active service, and was appointed to the important post of commissioner at the Prussian headquarters. In this capacity he was present at the battle of Ligny, June 16, 1815, where he lost his left hand by a shot, and thus was not present at Waterloo fought two days later. For the loss of his hand he received a pension of £300; and in the same year was made a K.C.B. In 1820 and 1826 Sir Henry Hardinge was returned to parliament as member for Durham; and in 1828 he accepted the office of secretary at war in Wellington's ministry, a post which he also filled in Peel's cabinet in 1841-43. In 1830 and 1834 he was chief secretary for Ireland. In 1844 he succeeded Lord Ellenborough as governor-general of India, a position which he retained till January 1848. During his term of office the Sikh War broke out; and the governor-general after the battle of Mudki magnanimously offered to serve as second in command under Lord Gough. He manifested all his old courage and skill, and at the peace, for his services in the campaign, he was created Viscount Hardinge of Lahore, and of King's Newton in Derbyshire, with a Government pension of £3000 for three lives; while the East India Company voted him an annuity of £5000. He returned to England in 1848, and in 1852 succeeded the duke of Wellington as commander-in-chief of the British army. While in this position he had the home management of the Crimean War, which he endeavoured to conduct on Wellington's principles—a system not altogether suited to the changed mode of warfare. In 1855 he was promoted to the rank of field-marshal. Viscount Hardinge resigned his office of commander-in-chief in July 1856 owing to failing health, and died on September 24th of the same year at his house near Tunbridge Wells.

HARDOI, a British district of Oudh, India, under the jurisdiction of the lieutenant-governor of the North-Western Provinces, lying between 26° 53' and 27° 47' N. lat., and between 79° 44' and 80° 52' E. long, with an area in 1878 of 2285.64 square miles. The district is an irregular parallelogram between the Gumti and Ganges; its greatest length from north-west to south-east is 78 miles; and the average breadth is 46 miles. It is bounded on the N. by Sháhjahánpur and Kheri; E. by Sitápur, the Gumti forming the boundary-line; S. by Lucknow and Unáo; and W. by Farrukhábad, the Ganges marking the boundary. It is a level district watered by the Ganges, Rám-gangá, Garra, Sukhetá, Sáí, Baita, and Gumti,—the three rivers first named being navigable by boats of 500 maunds, or about 17 tons burden. Towards the Ganges, the land is uneven, and often rises into hillocks of sand cultivated at

the base, and their slopes covered with lofty *manj* grass. The soil of Hardoi is lighter than that of perhaps any other district of Oudh, 27 per cent. being sand, 56 per cent. loam, and 17 per cent. clay. Several large *jhils* or lakes are scattered throughout the district, the largest being that of Sándi, which is 3 miles long by from 1 to 2 miles broad. These *jhils* are largely used for irrigation, 126,000 acres being watered from them. Large tracts of forest jungle still exist. Leopards, black buck, spotted deer, and *nilgái* are common; the mallard, teal, grey duck, common goose, and all kinds of waterfowl abound.

The inhabitants of Hardoi district in 1869 numbered 931,517, of whom 500,994 were males and 430,523 females (Hindus, 845,293; Mahometans, 85,824; Christians, 48; "others," 352). The nine largest towns are,—Sháhábád, 18,254 inhabitants; Sandíla, 15,511; Bilgrám, 11,534; Mallánwán, 11,670; Sándi, 11,123; Pihánt, 7582; Hardoi (the administrative headquarters of the district), 7156; Gopáman, 5949; and Páli, 5122. The principal religious fairs are the following:—At Bilgrám, in September, on the occasion of the *Rám Lítá* festival, lasting ten days and attended by about 40,000 persons; at Hattia Haran, during the whole month of Bhádra (August and September), attended by 100,000 persons; at Barsáya, in April and November, the *Pramhansa Samádh* festival, lasting for only a single day on each occasion, and attended by from 15,000 to 20,000 persons. These, together with several other smaller fairs, are held for religious purposes, and have no commercial importance. Rice, wheat, and other food-grains form the great staples of agriculture. The area under crops is 844,560 acres or 1319 square miles, being more than one-half the entire area. The Oudh and Rohilkhand Railway from Lucknow to Sháhjahánpur runs through Hardoi for a distance of 62 miles. There are also 329 miles of raised and bridged roads, and 73 miles of minor roads, intersecting the district. The principal imports are cotton, salt, country cloth, and European piece-goods; the chief exports,—food-grains, sugar, tobacco, horned cattle, and hides. The value of the imports in 1875 was £102,952; of the exports, £62,977. The gross revenue of the district in 1875 amounted to £170,952, the expenditure to £18,478. The regular police (1873) consisted of 436 officers and men, costing £6610. The number of schools in 1875 was 142, with 5877 pupils. The average rainfall for the ten years ending 1872 was 32 inches. Malaria fevers, epidemic cholera, and smallpox prevail.

History.—The first authentic records of Hardoi are connected with the Mussulman colonization. Báwan was occupied by Sayyid Sálár Masáid in 1028, but the permanent Moslem occupation did not commence till 1217. Owing to the situation of the district, Hardoi formed the scene of many sanguinary battles between the rival Afghan and Mughal empires. Between Bilgrám and Sándi was fought the great battle between Humáynu and Sher Sháh, in which the former was utterly defeated. Hardoi, along with the rest of Oudh, became British territory under Lord Dalhousie's proclamation of February 1856.

HARDOUIN, JEAN, was a classical scholar of the 17th century, at once singularly learned and learnedly singular. He was born at Quimper in Brittany in 1646, and died at Paris in 1727. Having acquired a taste for literature in his father's book-shop, he sought and obtained about his sixteenth year admission into the learned society of the Jesuits. In Paris, where he went to study theology, he ultimately became librarian of the Collége Louis le Grand. The life of laborious authorship inaugurated by his edition of Themistius (Paris, 1684), which included no less than thirteen new orations, was continued with wonderful perseverance and success. At the advice of Garnier he undertook to edit the *Natural History* of Pliny for the Delphin series, and five years saw the completion of a task which, in the opinion of Huet, would have taken any ordinary scholar fifty years. His attention having been turned to numismatics as auxiliary to his great editorial labours, he published several learned works in that department, marred, however, as almost everything he did was marred, by a determination to be at all hazards different from other interpreters. It is sufficient to mention his *Nummi antiqui populorum et urbium illustrati* (Paris, 1684), *Antirrheticus de nummis antiquis coloniarum et municipiorum* (Paris, 1689), and *Chronologia Vet. Test. ad vulgatum versionem exacta et nummis illustrata* (Paris, 1696). By the ecclesiastical authorities Hardouin was appointed to supervise

the *Conciliorum collectio regia maxima* (Greek and Latin, Paris, 1715, 12 vols.); but he was accused of suppressing important documents and foisting in apocryphal matter, and by order of the parliament of Paris the publication of the work was delayed till some of its deficiencies were remedied. It is, however, as the originator of a variety of paradoxical theories that the learned father is now best remembered. The most remarkable, contained in his *Chronologie expliquée par les médailles* (Paris, 1696), was to the effect that, with the exception of the works of Homer, Herodotus, and Cicero, the *Natural History* of Pliny, the *Georgics* of Virgil, and the *Satires* and *Epistles* of Horace, all the ancient classics of Greece and Rome were spurious, having been manufactured by monks of the 13th century.

In 1709 Jean Louis de Lorme published at Amsterdam an edition of Hardouin's *Opera Selecta*, and though he made many corrections at the author's suggestion, he refused to admit the wholesale cancelling of the passages condemned by the Jesuits. Details in regard to Hardouin's labours, controversies, and whimsies may be found in Bayle and Moreri; in Lacombe, *Dict. des portraits historiques; Lambert, Hist. litt. du règne de Louis XIV.*; Dupin, *Bibliothèque des auteurs ecclésiastiques*; Levot, *Biographie bretonne* (Vannes, 1852-57); and, more particularly, Augustin and Alois de Becker, *Bibliothèque des Écrivains de la Comp. de Jésus* (Liège, 1853).

HARDT, HERMANN VON DER (1660-1746), Orientalist, descended from an old Dutch family, was born at Melle, in Westphalia, on 15th November 1660. His father, who was treasurer of the county of Tecklenburg, appreciating his son's abilities, gave him a good education at Osnabrück, and sent him afterwards to Jena and Leipsic. Young Hardt, gifted with a quick disposition and a powerful memory, soon gained renown for his fluency in carrying on learned discussions in Latin; but the study of the Oriental languages diverted him from all other pursuits, and in no long time he made himself master of Hebrew, Syriac, and Chaldee. The duke of Brunswick, hearing of Hardt's fame, appointed him his librarian shortly after the Orientalist had founded at Leipsic a philobiblical society, with the object of determining the sacred text. In 1690 Hardt was called to the chair of Oriental languages at Helmstädt; and his late master was prevailed upon to present to that university his valuable library, of which Hardt was again appointed to take charge in 1702. Seven years later he was named rector of the gymnasium of Marienburg, a post which he held till his death on 28th of February 1746.

Among his numerous writings, the following deserve mention:—*Autographa Lutheri aliorumque celeberrimorum Virorum, ab anno 1517 ad annum 1546, Reformationis Ætatem et Historiam cœcile illustrantia*, 1690-91; *Magnum Œcumenicum Constantiense Concilium*, 1697; *Hebrææ lingue Fundamenta*, 1694; *Syriacæ lingue Fundamenta*, 1694; *Elementa Chaldaica*, 1693; *Historia Litteraria Reformationis*, 1717; *Enigmata prisæ orbis*, 1723. The last is a collection of pieces previously published separately, all of which had been condemned by the church. This republication was ordered to be suppressed. Hardt left a *History of the Reformation* in manuscript, which is preserved in the Helmstädt Juloum.

HARDWAR, or HURDWAR, an ancient town of India and place of pilgrimage, in Saharanpur district, North-Western Provinces, situated on the right bank of the Ganges at the foot of the Siwalik Hills, in 29° 57' 30" N. lat., 78° 12' 52" E. long. Population (1872), 4800. The town is of great antiquity, and has borne many names. It was originally known as Kapila from the sage Kapila. Hwen Tshang, the Chinese Buddhist pilgrim, in the 7th century A.D. visited a city which he calls Mo-yu-lo, the remains of which still exist at Mayapur, a little to the south of the modern town. Among the ruins are a fort and three temples, decorated with broken stone sculptures. The great object of attraction at present is the Hari-ke-charan, or bathing ghât, with the adjoining temple of Gangadwâra. The charan, or foot-mark of Vishnu, is imprinted on a stone let into the upper wall of the ghât, and forms an object of

special reverence. A great assemblage of people takes place annually, and every twelfth year a feast of peculiar sanctity occurs, known as a *Kumbh-mela*. The ordinary number of pilgrims at the annual fair amounts to 100,000, and at the *Kumbh-mela* to 300,000. The Hardwar meeting also possesses considerable mercantile importance, being one of the principal horse-fairs in Upper India. Commodities of all kinds, Indian and European, find a ready sale, and the trade in grain and food-stuffs forms a lucrative traffic. The Ganges canal draws its supply of water from a branch channel close to the town. Hardwar is a police station, with post and telegraph offices.

HARDY, ALEXANDRE (1560-1631), the most fertile of all dramatic authors, next to Lope de Vega and Calderon, merits a place in dramatic literature on that account alone. He is said to have written upwards of six hundred plays, of which forty-one were printed in his own edition of 1624-28, and may still be read. It cannot be charged upon modern writers that they are slow to see merit in early French authors, but it has been found impossible by any to admire the hasty works of a man who wrote a tragedy in eight days, and did not scruple to borrow situations from any quarter where he could find them. He at first followed a strolling company as its author, and ended by becoming the dramatist of the Théâtre du Marais. He knew how to make the most of his situations; he, evidently by constant practice, became a master of stage business and stage effects; he knew the kind of dialogue—coarse and rough—which would please his audience; his art, compared with that of Molière, his successor, is the art of a carpenter compared with that of a sculptor. To the student of the drama Hardy will always be an interesting figure, appearing as he does between the degraded morality and the modern comedy, an imitator alike of Italian pastoral and Spanish tragedy. He had no sympathy with the classical pretensions of Jodelle; he gave little heed to art; he thought entirely of what would succeed for the moment. One piece alone of Hardy's has succeeded in arresting the attention of critics, the tragedy of *Mariamne*. Hardy lived long enough to witness the first successes of Corneille.

HARDYNG, or HARDING, JOHN, an English rhyming chronicler of the 15th century, was born in 1378. Having been admitted at the age of twelve to the household of Henry Hotspur, son of the earl of Northumberland, he was afterwards present with his patron at the battles of Homildon (1402) and Cokelawe, and saw him fall in the fatal field of Shrewsbury (1402). He next entered the service of Sir Robert Umfraville, and held for some time the post of constable of the castle of Warkworth. In the beginning of the reign of King Henry V. he was commissioned to recover as many as possible of the deeds connected with the homage of the Scottish kings to the English crown: and we find him some time after presenting the results of his search to Henry at Bois de Vincennes. In recognition of his exertions he was promised the manor of Gedyngton in Northamptonshire (worth in the money of the time from £32 to £36), but the king dying before he obtained possession he was left, as he tells us, "without reward or lyfelode any wise." Beyond a stray notice in the Lansdowne MS. of his chronicle, to the effect that Hardyng was in 1424 at Rome consulting and transcribing the chronicle of Troguus Pompeius, there is little trace of his proceedings till 1434, when he received a safe conduct from James of Scotland, that he might bring with him "the thyngs which we spake to you at Coldingham of, for which we binde us by this letters to pay you a thousand marks of English nobles." A contract preserved in the Exchequer bears that in 1457 he delivered to the earl of Shrewsbury the letters in which David and Robert of Scotland recognized the English supremacy, and a number of less important documents of similar

tendency; and in the same year letters patent were issued granting him a pension of £20 per annum for life. The leisure of his old age appears to have been occupied with a revision of his chronicle, which he presented to Edward IV. It could not have been finished before 1465, but it only comes down to the flight of Henry VI. to Scotland. The purpose of the writer being "that Englishe men might have understanding of all affairs touching their own countree Even to his dayes from all antiquitee," he starts his narrative with Brutus the Trojan, and details the history of all the mythical kings. When he comes down to his own time a considerable part of the material is derived from his own experience. The Scottish portions are animated by strong national hostility: "unto the Scots he could never be friend."

The most important MSS. of Hardyng's Chronicle are the Lansdowne (20) and the Harleian (661) in the British Museum, the Bodleian (*Archiv. Seld.*, B 10), and the Ashmolean. Richard Grafton printed two editions in January 1543, which differ in almost every page from each other. Grafton's abridgment was printed by Tottel in 1562, and again in 1564. Mr Ellis in 1812 edited the work from the Lansdowne MS., and prefixed a life of the author.

HARE, the common name of all the species, excepting the rabbit, of *Leporidae*, a family of rodent mammals, distinguished from the rest of that order by the possession of four incisor teeth in the upper jaw, two in front, which are well developed and longitudinally grooved, and two exceedingly small ones behind. The molars are formed for the mastication of vegetable food, an uneven surface being produced by the presence of transverse enamel plates which are worn down more slowly than the intermediate dentine. The teeth are without permanent roots, and thus the constant waste at the surface is compensated for by continuous growth at the opposite extremity. Hares all possess long ears, and in most species the hind legs are much longer than those in front. They are without exception timid, defenceless animals, although during the breeding season two males have been known to fight together for possession

FIG. 1.—Common Hare.

of the female until one was killed; while all the species are protectively coloured. They form a single genus (*Lepus*), containing from thirty-five to forty species according as certain forms are regarded as independent species, or merely as geographical varieties. They occur in all the great zoological regions of the world, but are especially characteristic of the northern and temperate areas of both hemispheres.

The common hare (*Lepus timidus*, fig. 1) is a typical example of the family. The ears in this species are longer than the head, and its hind legs are so long in comparison with those in front, that it is only by descending a hill diagonally that it can avoid overbalancing itself. It is found in all parts of Europe except the north of Russia, the Scandinavian peninsula, and Ireland, and is specially abundant in those countries in which it enjoys the protection of game laws. Its fur is usually of a tawny grey colour above and white

beneath, with the upper surface of the short tail and the tips of the ears black. The colour of the fur, however, differs considerably in different latitudes and at different seasons of the year, showing, for example, a tendency to become white during winter in northern countries, while assuming a reddish-yellow hue in the more genial climate of southern Europe. On the strength mainly of such outward differences various species have been described, but these have been found to be so linked together by intermediate forms as to satisfy most naturalists that they are merely climatal varieties of one species. The hare is a night-feeding animal, remaining during the day on its "form," as the slight depression is called which it makes in the open field, usually among grass. This it leaves at nightfall to seek the fields of young wheat and other cereals whose tender herbage forms its favourite food. It is also fond of gnawing the bark of young trees, and thus often does great damage to plantations. In the morning it returns to its form, where it finds considerable protection in the close approach which the colour of its fur makes to that of its surroundings; should it thus fail, however, to elude observation it depends for safety on its extraordinary fleetness. On the first alarm of danger it is said to sit erect and to reconnoitre, when it either seeks concealment by clapping close to the ground, or takes to instant flight. In the latter case its great speed, and the cunning endeavours it makes to outwit its canine

FIG. 2.—Mountain Hare.

pursuers, form the chief attractions of coursing. The hare takes readily to the water, where it swims well; and Yarrell records an instance in which one was observed crossing an arm of the sea about a mile in width. Hares are remarkably prolific. They pair when scarcely a year old, and the female brings forth several broods in the year, each consisting of from two to five leverets (from the French *lièvre*), as the young are called. These have their sight at birth, and after being suckled for a month they are able to look after themselves. In Europe this species has never been known to breed in confinement. The hare was well known to the ancient Greeks and Romans.

In those parts where the common hare does not occur, its place is taken by the varying or mountain hare (*Lepus variabilis*, fig. 2). It is found throughout the entire northern portion of the great Palæartic region, from Ireland eastward to Japan, while it also occurs on the Pyrenees, the Alps, the highlands of Bavaria and the Caucasus, although altogether absent in the less elevated regions which connect those mountain ranges. Its presence in such isolated situations in company with many truly arctic plants is regarded as one of the many proofs of a former glacial epoch, during which boreal plants and animals were spread all over southern and central Europe. On the advent, however, of milder climatic conditions, this northern flora and fauna retired towards the Arctic Circle, leaving a few species, such

as the varying hare, behind on the various mountain ranges, where by ascending to a sufficient altitude the necessary boreal conditions could be obtained. The mountain hare differs from the preceding species in its ears being shorter than its head, and in its fur becoming in most cases white in winter,—a change of colour which renders it almost invisible in the snow. Along the southern limit of its range, or in districts where the temperature is from any cause exceptionally mild, this change of colour either does not take place at all, as in Ireland, or is only partial, as in many parts of Scotland. In this respect it resembles the ermine, which it further resembles in having a part of its fur always remaining black; in the hare, however, it is the tips of the ears, and not the point of the tail, which thus remain unaltered. In Scotland, where it is known as the “blue hare,” it occurs plentifully throughout the hilly regions north of the Forth, where it descends to the low grounds in winter; while in Ireland it is the only hare found. Owing to the mildness of the climate, however, in the “Green Isle,” the colour of the fur undergoes little or no alteration in winter, and on this account it was until recently regarded by many as a distinct species (*Lepus hibernicus*). Throughout the Arctic regions of North America a closely allied species, the polar hare (*Lepus glacialis*), occurs. Naturalists have hitherto had considerable difficulty in distinguishing this from the preceding species, the chief difference being in the colour of the fur, which in the Polar hare is white all the year round, with the exception of the tips of the ears. Considerable light has, however, been thrown on this point by the observations of the naturalists attached to the late Arctic Expedition under Sir George Nares, who found this species inhabiting the shores of Grinnell Land, and obtained evidence in foot-prints on the snow of its existence in latitude 83° 10', about 20 miles north of the nearest land. Unlike all other hares, and resembling in this respect the rabbit, the polar hare would seem to occupy a burrow—“a hole,” says Captain Feilden, “4 feet in length, scraped horizontally into a snow drift.” “I have no doubt,” he continues, “the same burrow is regularly occupied, as this one was discoloured by the feet of the animal, and a quantity of hair was sticking to the sides.” Another point of importance in establishing the specific distinctness of this species from the former lies in the difference in the number of young composing a brood in each of these species. The number of young found in gravid females by the naturalists already referred to varied from seven to eight, while in the varying hare of Europe the number does not exceed five. According to Captain Lyon, the polar hare is by no means a shy animal, as during his cruise in the Arctic seas hares were in the habit of coming out on the ice to his ships to feed on the tea leaves which were thrown overboard. This species has thus been found inhabiting the highest northern lands yet visited by man, where it also attains its normal weight of from 8 to 10 lb., subsisting on the stoneworts and other hardy plants which form the scanty vegetation of circumpolar valleys. The American varying hare (*Lepus americanus*) is one of the most widely distributed species of this family, extending, in one or other of its four geographical varieties, from the borders of the Arctic barren grounds southwards to New Mexico. It differs from the mountain hare of Europe in its smaller size and relatively smaller ears, but resembles it in the change of colour in the fur, especially of the northern varieties, during winter. It is exceedingly abundant on the banks of the Mackenzie River, where it is killed in great numbers by the Hare Indians. A favourite device among the Indians for catching it, according to Darwin, is to walk spirally round and round it, when on its form, especially at midday when the shadow of the hunter is shortest. It has still more implacable enemies, however, in the wolves,

gluttons, and lynxes of those regions, of the last of which it is said to form the principal food. The fur of this species is imported into Great Britain, but it is of little value. In the swampy district of the south-eastern portion of the United States, the swamp hare (*Lepus aquaticus*) and the marsh hare (*Lepus palustris*) occur. These take readily to the water, and are said to dive for some distance, their legs being less thickly clothed with hair than are those of the less amphibious species. They feed chiefly on aquatic plants. Only one species of hare (*Lepus brasiliensis*) occurs in South America. It is found throughout Brazil, and on various parts of the Andes in Bolivia and Peru. Fossil remains of several species of *Leporidae* have been found in the Post-Glacial deposits and the bone-caves of Europe, while the remains of many extinct species have been lately discovered in the Miocene deposits of Dakota and Colorado. (J. G.)

HARE, JULIUS CHARLES (1795–1855), theological writer, was born at Valdagno, near Vicenza, in Italy, on the 13th of September 1795. He came to England with his parents in 1798, but in 1804–5 spent a winter with them at Weimar, where he met Goethe and Schiller, and received a bias to German literature which influenced his style and sentiments throughout his whole career. On the death of his mother in 1806, Julius was sent home to the Charterhouse in London, where he remained till 1812, when he entered Trinity College, Cambridge. There he became fellow in 1818, and after some time spent abroad he began to read law in London in the following year. In 1822 he was appointed assistant-tutor at Trinity College, which position he retained for ten years. Turning his attention from law to divinity, Hare took priest's orders in 1826; and, on the death of his uncle in 1832, he succeeded to the rich family living of Hurstmonceaux in Sussex, where he accumulated a library of some 12,000 volumes, especially rich in German literature. Before taking up residence on his parish he once more went abroad, and made in Rome the acquaintance of the Chevalier Bunsen, who afterwards dedicated to him part of his work, *Hippolytus and his Age*. In 1840 Hare was appointed archdeacon of Lewes, and in the same year preached a course of sermons at Cambridge (*The Victory of Faith*), followed in 1846 by a second, *The Mission of the Comforter*. Neither series when published attained any great popularity. Archdeacon Hare married in 1844. In 1851 he was collated to a prebend in Chichester; and in 1853 he became one of the queen's chaplains. He died January 23, 1855.

Julius Hare belonged to what has been called the “Broad Church party,” though some of his opinions approach very closely to those of the Evangelical Arminian school, while others again seem vague and undecided. He was one of the first of his countrymen to recognize and come under the influence of German thought and speculation, and, amidst an exaggerated alarm of German heresy, did much to vindicate the authority of the sounder German critics. His writings, which are chiefly theological and controversial, are largely formed of charges to his clergy, and sermons on different topics; but, though valuable and full of thought, they lose some of their force by the cumbersome German structure of the sentences, and by certain orthographical peculiarities in which the author indulged. In 1827 *Guesses at Truth by Two Brothers*¹ appeared. Hare assisted Thirlwall, afterwards bishop of St David's, in the translation of the 1st and 2d volumes of Niebuhr's *History of Rome* (1828 and 1832), and published a *Vindication of Niebuhr's History* in 1829. He wrote many similar works, among which is a *Vindication of Luther against his recent English Assaults*, 1854. In 1848 he edited the *Remains of John Sterling*, who had formerly been his curate. Carlyle's *Life of John Sterling* was written through dissatisfaction with the “Life” prefixed to Archdeacon Hare's book. *Memorials of a Quiet Life*, published in 1872, contain accounts of the Hare family.

¹ Julius Hare's co-worker in this book was his brother Augustus William Hare (1792–1834), who, after a distinguished career at Oxford, was appointed rector of Alton Barnes, Wiltshire. He died prematurely at Rome in 1834. He was the author of *Sermons to a Country Congregation*, published in 1837.

HAREBELL, or, as the name is often written, HAIRBELL, known also as the Blue-bell of Scotland, and Witches' Thimbles, a well-known perennial wild flower, *Campanula rotundifolia*, L., a member of the natural order *Campanulaceæ*. The harebell has a very slender slightly creeping root-stock, and a wiry, erect stem. The radical leaves, to which the specific name refers, have long stalks, and are roundish or cordate, crenate or serrate; the lower stem leaves are ovate or lanceolate, and the upper ones linear, subsessile, acute and entire, rarely pubescent. The flowers are slightly drooping, arranged in a panicle, or in small specimens single, having the calyx-tube glabrous, with subulate and erect segments, the corolla campanulate, with slightly recurved segments, and the capsule nodding, and opening by pores at the base of the calyx-tube. There are two varieties:—(a) *genuina*, with slender stem leaves, and (b) *montana*, in which the lower stem-leaves are elliptical-oblancoate. The plant is found on heaths and pastures throughout Great Britain and North America, and flowers in late summer and autumn. The harebell has ever been a great favourite with poets, and on account of its delicate blue colour has been considered as an emblem of purity.

Harebell (*Campanula rotundifolia*)

HAREM, or less frequently HARAM, the recognized European title for that portion of a polygamist's house which is devoted to the exclusive occupancy of his wives and their attendants, or, by a simple metonymy, for the female portion of his household. The word *harem* is Arabic for anything forbidden or not to be touched. It is generally applied in Moslem law to such things as games of chance, draughts, chess, witchcraft, and portrait-taking, which are inconsistent with the religious code, and under the form of *haram* it is well known even to Europeans as designating the sacred enclosure of the principal mosque at Cairo and at Jerusalem (*Haram esch-Scherig*). The word *seraglio*, which is not unfrequently employed as equivalent to *harem*, is an Italian modification (usually spelled *serraglio* from assimilation to *serrare*, to shut in) of the Persian term *serai*, which simply means a palace or large building, as in the familiar compound *caravanserai*. Wherever polygamy is maintained in the midst of a developed social life, the *harem* appears to be an almost inevitable institution. We consequently find it after a more or less rigid type among the Jews, the Babylonians, the Siamese, the ancient Persians, the Peruvians, &c. But it is among the modern Mahometan peoples that it has attained its most perfect development; and the harems of the sultan of Turkey and the shah of Persia may be taken as the most elaborate and best-known specimens of the type.

According to the Koran, the Mussulman is required to satisfy himself with four wives, but the sultan may possess as many as seven. Each of these has her own suite of apartments, her own garden and bath-room, and her own body of servants, male and female. They are not called by their names, but distinguished as *Kadin* (or Lady) Number One, *Kadin* Number Two, and so on. The title of *sultana* is bestowed only on the mother, the sister, or the daughter of a sultan; and consequently it is the *kadin* who first gives

birth to an heir to the empire who alone can have this distinction. She further obtains the title of *hasseky* or *kasseki*, but this is lost if the child dies. All the female slaves, or as they are called *odalisks* (a European corruption of the word *odalik*, from *oda* a chamber, and *lik* belonging to), are at the absolute disposal of the sultan, and if, in spite of the natural endeavours of the *kadins* to prevent such a contingency, one of them becomes the mother of her lord and master's first-born, she is advanced to the rank of *sultana hasseky*. It is contrary to etiquette for the sultan to select his own favourites among the *odalisks*; he is expected to accept the choice made for him by his mother, who bears the title of *validé*, and exercises great influence not only in the affairs of the harem but even in political matters. Every *odalisk* who has been promoted to the royal couch is henceforth considered sacred from all meaner patronage, and receives apartments and attendants of her own; but she has no further claim to the sultan's attention, and may have to console a life-long widowhood with the memory of the honour which was once bestowed on her. The ranks of the *odalisks* are ever and anon recruited by slaves presented to the sultan by his female relatives or the state officials. The latter, for example, are accustomed to make acknowledgment of their allegiance in this way every year on the evening before the 15th of Ramazan. An old and devoted favourite of the sultan occupies the post of *kehaya chatun*, or lady superintendent of the harem. A large body of eunuchs, both black and white, are employed as guards and gate-keepers. The white eunuchs have charge of the outer gates of the *seraglio*, but they are not allowed to approach the women's apartments, and obtain no posts of distinction. Their chief, however, the *kapou aghassi*, or master of the gates, has part control over the ecclesiastical possessions, and even the vizier cannot enter the royal apartments without his permission. The black eunuchs have the right of entering the gardens and chambers of the harem. Their chief, usually called the *kizluer aghassi*, or master of the maidens, though his true title is *darus scadet aga*, or chief of the abode of felicity, is an official of high importance. His appointment is for life. If he is deprived of his post he receives his freedom; and if he resigns of his own accord he is generally sent to Egypt with a pension of 100 francs a day. His secretary keeps count of the revenues of the mosques built by the sultana. He is usually succeeded by the second eunuch, who bears the title of treasurer or *khaznahdar*, and has charge of the jewels, &c., of the women. The number of eunuchs is always a large one. The *sultana validé* and the *sultana hasseky* have each fifty at their service, and others are assigned to the *kadins* and the favourite *odalisks*.

Further details on the Sultan's harem will be found in an anonymous paper in the *Revue d'Orient* (London, 1861), in the elaborate article by Hoffmann in Ersch and Gruber's *Encyclopædie*, and the *Serraglio del gran signore descritto* (Venice, 1865) by Ottaviano Bon, Venetian ambassador in 1608. An account of a visit to the harem of the Persian prince Melek Kasim Mirza was given by M. Flandin in the *Revue des Deux Mondes* (1852), and at the time created a great sensation in Persia. Sketches of harem interiors are common in our popular literature from Lady Mary Wortley Montagu's *Letters and Lempiere's Tour to Morocco* (1793) down to Mrs S. Harvey's *Turkish Harems and Circassian Homes* (Lond., 1871). The Count de Beauvoir gives a picture of the harems of the sultan of Java and the Siamese mandarins in his *Voyage round the World* (Lond., 1870). Much interesting information on harem life in general is supplied by Dr Häntzsche (who as a physician was *mehrem* or admissible to the harem) in *Zeitschrift für allgemeine Erdkunde* (Berlin, 1864).

HARFLEUR, the Harfleur of our older historians, a maritime town of France in the department of Seine Inférieure and arrondissement of Havre, about 6 miles E. of Havre on the railway between that city and Rouen. It lies in the fertile valley of the Lézarde, at the foot of wooded hills not far from the northern bank of the

Seine; and the steeple of St Martin's, 289 feet high, forms an excellent landmark for the pilots of the river. Its old ramparts are now replaced by bleach-works, chemical factories, and other industrial establishments, and the fosses are transformed into vegetable gardens. St Martin's is the most remarkable building in the town, and ranks as an "historical monument." It dates from the 15th and 16th centuries, but the great portal is the work of the 17th, and the whole has undergone the process of modern restoration. Of the old castle there are but insignificant ruins, and the present castle, situated in a fine park to the northward, is a building of the 18th century. The hôtel de ville belongs to the 16th. In 1872 the population was only 1966, and though for its size Harfleur is still a busy place with its fishers and traders, it has greatly fallen from its ancient importance.

In the Middle Ages, when its name, Herosfloth, Harosfluet, or Hareflot, was still sufficiently uncorrupted to indicate its Norman origin, it was the principal seaport of north-western France. In 1415 it was captured by Henry V. of England, but when in 1435 the people of the district of Caux rose against the English, 104 of the inhabitants opened the gates of the town to the insurgents, and thus got rid of the foreign yoke. The memory of the deed was long perpetuated by the bells of St Martin's tolling 104 strokes. Between 1445 and 1449 the English were again in possession; but the town was recovered for the French by Dunois. In 1562 the Huguenots put Harfleur to pillage, and its registers and charters perished in the confusion; but its privileges were restored by Charles IX. in 1568, and it was not till 1710 that it was subjected to the "taille." By common consent Harfleur is now identified with the Caracotinum of the *Itinerary* of Antoninus.—M. Falluc's explorations since 1839 having proved conclusively that the neighbourhood is rich in Roman remains.

Falluc's papers in *Archives du Havre*, 1840, *Mém. de la Soc. des Antiquaires de la Normandie*, and *Revue Archéologique*, 1856-57; Abbé de Cochet, *La Seine Inférieure*, Paris, 1864; E. Dumont and A. Léger, *Hist. de la ville de Harfleur*, 1868.

HARGREAVES, JAMES. See COTTON, vol. vi. p. 490.

HARIÁNÁ, or HURREANAH, a tract of country in the Punjab, India, consisting of a level upland plain, interspersed with patches of sandy soil, and largely overgrown with brushwood. The Western Jumna Canal now fertilizes the grounds of a large number of its villages. Since the 14th century Hissár has been the local capital. During the troublous period which followed on the decline of the Mughal empire, Hariáná formed the battlefield where the Marhattás, Bhattás, and Sikhs met to settle their territorial quarrels. The whole surrounding country was devastated by the famine of 1783. Since the conquest of the Punjab, Hariáná has been broken up into the districts of Hissár, Rohtak, and Sirsa.

HÄRING, WILHELM (1797-1871), German novelist, known as Wilibald Alexis, was born at Breslau, June 23, 1797. He attended the Werder gymnasium in Berlin, and served as a volunteer, in the campaign of 1815. On his return he studied law for some time at the universities of Berlin and Breslau, but he soon gave up the legal profession and devoted himself to literature. He made some attempt to add to his income by practical undertakings, but they were rarely successful. He was fond of travel, and happened to be in Italy with his wife during the Revolution of 1848, the progress of which he had an opportunity of watching in Rome, Florence, and Naples. In 1852 he transferred his residence from Berlin to Arnstadt in Thuringia. Here he was laid low by paralysis of the brain, and after many years of suffering died on the 16th September 1871. Häring began his literary career in 1823 with a historical romance, *Walladmor*, which was given out as the work of Sir Walter Scott.¹ It rapidly became popular, and was translated into several languages, including English. He next published *Schloss Avalon*, which he

attributed to the same author. Soon afterwards he issued a number of very successful short stories and several books of travel, and for a time he indicated a preference for the polemical tendencies of the school of Young Germany. In *Cabanis*, however, which appeared in 1832, he entered the special field of historical romance in which he was destined to achieve his highest fame. From 1840 onwards he published at short intervals a series of romances, each of which deals with some particular epoch in the history of Brandenburg. Among them may be named *Der Roland von Berlin* (1840), *Der falsche Waldemar* (1842), *Der Werwolf* (1848), *Ruhe ist die erste Bürgerpflicht* (1852), *Isegrimm* (1854), and *Dorothea* (1856). These tales are not only full of patriotic feeling, but in all of them the interest is well-sustained and the characters are drawn with a bold and firm hand. His *Gesammelte Werke* have been issued in Berlin in 20 volumes.

HARINGTON, SIR JOHN (1561-1612), was the son of Mr John Harington, of Kelston, near Bath, who had been imprisoned in the Tower by Queen Mary for forwarding a letter to Elizabeth. Harington, born in 1561, was Elizabeth's godson. He studied at Eton and at Christ's College, Cambridge, where he took the degree of M.A., his tutor being Bishop Still, the famous author of *Gammer Gurton's Needle*. He came up to London about 1583 and studied law, but Queen Elizabeth seems to have removed him to a place at court. Tradition relates that it was at her command that he undertook the translation of Ariosto's *Orlando Furioso*, a work that saw the light in 1591 and was reprinted in 1607 and 1634. Soon after this first date Harington retired to the family mansion at Kelston. In 1596 he published in succession *The Metamorphosis of Ajax*, *An Apology*, and *Ulysses upon Ajax*, the three forming collectively a very absurd and indecorous work of a Pantagruelistic kind. In 1599 he served in Ireland under Essex, and was knighted on the field, to the annoyance, it is said, of Elizabeth. He married a lady of title, who bore him eight children, and who survived until 1634. In 1608 he wrote a personal satire against the bishops, which he read to James I., but which was first published, by a Presbyterian printer, as late as 1653, under the title of *A Brief View of the State of the Church*. This is a somewhat scandalous production. In the spring of 1612, Harington was suffering heavily from the dropsy, and in December of that year he died. In 1613 his *Epigrams*, which had circulated widely in MS., were printed in a collection of the verse of various writers entitled *Alcilia*, and separately in 1615. They became very popular, and were often reprinted. The miscellaneous writings of Harington existing in MS. in his family were first collected by the Rev. Henry Harington in 1779, in 2 volumes, under the title of *Nugæ Antiquæ*. The *Nugæ* include some very elegant pieces of the poet's father.

The translation of the *Orlando Furioso* was a very important labour, and it was carried out with skill and perseverance. Harington, however, was neither a very exact scholar nor a very poetical translator, and he cannot be named in the same breath with Fairfax. The *Orlando Furioso* was a sumptuous book, illustrated in the best taste of the day, and to it were appended a prose critique of the poem, and a life of Ariosto compiled by Harington from various Italian sources. Harington's Rabelaisian pamphlets show that he was almost equally endowed with wit and indelicacy, while of his epigrams little can be said but that they are sometimes smart and always easy.

HARIRI. Abu Mohammed al Kasim ibn 'Alī Ibn Mubammed ibn 'Othman, surnamed al Hariri, was born at Bassorah 1054-55 A.D. and died in 1121 or 1123, being therefore contemporary with the first crusade. His native city was renowned for its school of grammar, a most im-

¹ One of the interlocutors in the focalar "Introduction" to Scott's *Barrothed* (1825) supposes *Walladmor* "to have been the work of Dousterswivel, by the help of the steam-engine."

portant science amongst a people whose every rule of religion and of life depended upon the accurate interpretation of some word or passage of the Koran, or some saying of the prophet. The rival school of Kufa was the only one that approached it in fame or glory, and in all the numerous disputes that took place between the two academies Bussorah is generally allowed to have had the advantage. His name Hariri signifies silk-merchant, and was probably derived from his father's occupation, as, in spite of the assertion of his biographers to that effect, he appears not to have ever engaged in trade, but to have devoted himself exclusively to literary pursuits. His great object was to investigate the niceties of the Arabic language, and he composed several treatises on the subject, amongst which the best known are *Molhat el 'Arab* (Beauties of Desinential Syntax) and *Durrat el Ghawwás* (The Diver's Pearl), in which he criticizes certain common faults of language in vogue amongst the educated. Portions of both these works have been published by De Sacy in his *Chrestomathie*, and the *Durrat el Ghawwás* has been edited by H. Thorbecke (Leipsic, 1871). But his great work is the *Makámát*, or "Assemblies," in which a series of anecdotes of a very slight character in the career of an imaginary learned vagabond afford the opportunity for the display of vast philological and literary learning. The plan was not original, having been already invented and used by Badí' az Zamán el Hamadáni, who died about 1008. The composition of Hariri's own *Makámát* is attributed to the following circumstance. Being one day in the mosque of the Beni Haram, in the quarter of Bussorah in which he resided, he noticed an old man enter, shabby and worn with travel, who in answer to the questions of the persons present gave his name as Abu Zeid, and said that he came from Serúj, a city near Edessa, which had recently been devastated by the crusaders. The old man related the incidents of the destruction of his native city and his own domestic losses and exile in so eloquent a strain as to excite general admiration and compassion. On reaching his home Hariri wrote out the incident in the form of a makámeh or assembly, in the style of El Hamadáni's work, and it now forms the 48th of his book. When subsequently elaborating the idea he modelled the successive chapters on the same theme; a simple-minded Arab gentleman, El Harith ibn el Hammám, on his travels constantly meets with a vagabond old improvisatore, Abu Zeid, who, under different characters and disguises, always succeeds in eliciting the sympathy and alms of his audience and the approbation of El Harith himself. Abu Zeid is always poor, ill-dressed, and crafty, but eloquent in the extreme, and his fraudulently-obtained gains are always spent in some forbidden enjoyment; yet there is ever a good side to his character, and he is not without an exhibition of true feeling, especially when he alludes to the circumstances of his expulsion from his home, and the loss of his daughter, who had been made captive by the marauding Franks. The improvised speeches of Abu Zeid are masterpieces of Arabic learning, every sentence being made to introduce some allusion to Arab history, poetry, or tradition, or the discussion and elucidation of some difficult point of rhetoric or grammar. It is this that gives the value to the book and makes it with its commentary a complete encyclopædia of classical Arabic literature and philology. It is written in rhymed and rhythmical prose, such as is used in the Koran itself, interspersed with verses of poetry of which the merit is more often in the language than the thought.

The *Makámát* have been edited by Silvestre de Sacy, with a select Arabic commentary (Paris, 1822), and a new edition of this edition, with numerous French notes, was issued by MM. Reinaud and Derenbourg (Paris, 1853). An English translation of some select "Assemblies" was made by Theodore Preston for the Oriental Translation Fund (London, 1850), and an admirable translation of

the first twenty-six assemblies by T. Chenery (London, 1867), containing an introduction and notes, and a resumé of all the literature of the subject. Of the numerous imitations of the *Makámát* of Hariri, the best known are the *Machberoth Ithiel*, a Hebrew work by Yehudah ben Shelomoh al Kharizi, edited by T. Chenery (London, 1872), and the *Majma' at Bahrain* (Confluence of the Two Seas), by Nasyf el Yaziji (Beyrout, 1853), an excellent work in Arabic, displaying an immense acquaintance with the ancient literature of the language. HARLEQUIN. See PANTOMIME.

HARLEY. See OXFORD, EARL OF.

HARLINGEN, or HAARLINGEN, in Frisian *Harns*, an important trading town and seaport in the province of Friesland in the Netherlands, is situated 17 miles W. of Leeuwarden with which it has been connected by rail since 1863. Besides its dilapidated fortifications, and the town-house, which was erected between 1730 and 1732 and is adorned with a statue of the historian Simon Stijl, the only noteworthy buildings are the Great or New church, the West church, which was formerly part of the castle, the Roman Catholic church, and the Jewish synagogue. The school of navigation and school of design may also be mentioned. Harlingen is the seat of the Frisian Navigation Company, and it has regular steam communication, not only with Amsterdam and Nieuwe Diep, but also with London and Hull. Besides an inner harbour protected from the high tides by powerful sluices, it has an outer harbour of modern construction for the accommodation of large vessels. One of the chief departments of its trade is the export to England of Frisian produce—corn, cattle, butter, cheese, and flax. Wharves, saw-mills, anchor forges, rope-yards, and a canvas factory represent the auxiliary industries of the place. In the middle of the last century, Harlingen had 7000 inhabitants, which increased in the course of the next hundred years to about 8000. In 1860, before the new harbour works, they numbered 9800, and in 1878 they were 10,800.

Originally Harlingen was only a part of the village of Almenum, and lay at some distance inland, but the Zuyder Zee, which had already in 1134 destroyed an intervening town, made another inroad in 1566 and attained its present limits. The Spanish lieutenant Caspar Robles de Bely, whose monument, the "Man of Stone," now stands on the sea-dyke, took care to protect the site of the town by further embankments. In 1579 it was surrounded by walls and fosses; a new castle had been built in 1502. During the civil broils of 1787 Harlingen was blockaded by the patriots of Franeker. In November 1776 and February 1825 it suffered from severe inundations.

HARMODIUS, a beautiful Athenian of the tribe Gephyraei, was the intimate friend of Aristogiton, a citizen of the middle rank. Hipparchus, younger brother of the tyrant Hippias, was also a lover of Harmodius. He tried to attract Harmodius to himself, and failing in the attempt, revenged himself by putting a public affront on his sister at a solemn festival. Thereupon the two friends conspired with a few others to murder both the tyrants during the armed procession at the Panathenaic festival (514 B.C.). But in a sudden alarm they prematurely attacked and slew Hipparchus alone. Harmodius was cut down on the spot by the guards, and Aristogiton was soon captured and tortured to death. When Hippias was expelled (510 B.C.), Harmodius and Aristogiton became the most popular of Athenian heroes; their statues were set up in the agora, their descendants were exempted from public burdens, and their names were celebrated in popular songs and scolia as the deliverers of fair Athens. Thucydides (vi. 54) alludes to the falseness of the popular belief about them, and gives the story in detail.

HARMONIA, wife of Cadmus. The Theban legends (see CADMUS) have been so modified and systematized by poets and logographers that we must look to Samothrace with its old religious rites for an explanation of the myth. There Harmonia is said to have been the daughter of Zeus and Electra, while her brother Iasion was the founder of

the mystic rites which were celebrated annually on the island. When Cadmus came to Samothrace, and was initiated, he received Harmonia as his wife. The gods honoured the wedding with their presence, Athene presented the bride with a peplos and necklace, Electra gave the mystic rites of the mother of the gods. According to the scholiast on Euripides (*Phœn.*, i.) Cadmus with the aid of Athene carried off Harmonia; and in the mysteries the lost Harmonia is regularly sought for. We have here an exact parallel to the Eleusinian legends. Electra and Harmonia are mere varieties of Demeter and Core. Cadmus like Pluto carries off the bright daughter of the goddess to the world below to spend there the dreary winter. Hence in the Theban tale Cadmus and Harmonia leave Thebes to go away among the Encheleis, the snake people, are themselves changed into serpents, and are finally translated to the Elysian fields. We then understand, too, why (according to Pausanias, ix. 16, 5) Cadmus dwelt at Thebes in the temple of Demeter Thesmophoros. The necklace, wrought by Hephæstus, which Harmonia received as a marriage gift, may be compared with the cestus of Aphrodite; for it is impossible to draw a fast line between Harmonia or Core and Aphrodite. Then it is seen to be the mythic representative of some phenomenon like the halo of dawn or the rainbow. Like the works of the German dwarfs, this necklace carried with it ill-luck, and the legends give it a history of woe. With it Polynices bribed Eriphyle to betray her husband Amphiaræus. It brought death at last to her son Alcæmon. Dedicated in the temple of Athene Pronoia at Delphi, it was given by the tyrant Phayllus (352 B.C.) to his mistress; her son going mad set fire to the house, and she perished in the conflagration.

HARMONICA is the technical name for the "musical glasses" with the learned conversation about which the pseudo-ladies from town astonish the simple-minded vicar of Wakefield. An instrument for producing musical sounds by means of drinking glasses touched with the moistened fingers was, however, known 100 years before Goldsmith's novel. What its exact nature may have been cannot now be ascertained, but its mode of playing must have been far from perfect; for as late as the middle of the 18th century the musical glasses played by Mr Puckeridge were placed on a table and their pitch was fixed by the quantity of water they contained, naturally a very uncertain mode of determination. It was to this instrument that the great Benjamin Franklin applied his improvements described in his letter to Father Beccaria of Turin. Instead of fixing the glasses he made them rotate round a spindle set in motion by the player's foot by means of a treadle. The edge of the glasses by the same means passed through a basin of water, the pitch henceforth being determined by the size of the glasses alone. The player touched the brims of the revolving glasses with his finger, his task being further facilitated by the scale of colour which Franklin adopted in accordance with the musical gamut. Thus C was red, D orange, E yellow, F green, G blue, A indigo, and B violet. The black keys of the piano were represented by white glasses. The instrument thus improved became very fashionable in England, and a Miss Davis, a relation of Franklin's, became a celebrated harmonica player, who performed at numerous concerts with great applause. It is interesting to know that the great composer Gluck was a virtuoso on the musical glasses in their earlier form, which he played, according to a contemporary advertisement, at the Haymarket Theatre, April 23, 1746. He even seems to have claimed the instrument as his own invention, and promises to "perform upon it whatever may be done on a violin or harpsichord." Nowadays the idea of a composer of repute—for such Gluck was at the time—playing on the

musical glasses would appear grotesque. But the notions of artistic dignity were different in the 18th century. Many attempts have been made to increase the power and flexibility of the harmonica, and also to avoid the nervous irritability said to be caused by the friction of the vibrating glasses. Thus harmonicas played with the bow or by means of a keyboard, like that of the pianoforte, have been invented. But none of these has met with permanent success, and in all essential points the modern harmonica is such as Franklin left it.

HARMONIC ANALYSIS is the name given by Sir William Thomson and Professor Tait in their treatise on *Natural Philosophy* to a general method of investigating physical questions, the earliest applications of which seem to have been suggested by the study of the vibrations of strings and the analysis of these vibrations into their fundamental tone and its harmonics or overtones.

The motion of a uniform stretched string fixed at both ends is a periodic motion; that is to say, after a certain interval of time, called the fundamental period of the motion, the form of the string and the velocity of every part of it are the same as before, provided that the energy of the motion has not been sensibly dissipated during the period.

There are two distinct methods of investigating the motion of a uniform stretched string. One of these may be called the wave method, and the other the harmonic method. The wave method is founded on the theorem that in a stretched string of infinite length a wave of any form may be propagated in either direction with a certain velocity, V , which we may define as the "velocity of propagation." If a wave of any form travelling in the positive direction meets another travelling in the opposite direction, the form of which is such that the lines joining corresponding points of the two waves are all bisected in a fixed point in the line of the string, then the point of the string corresponding to this point will remain fixed, while the two waves pass it in opposite directions. If we now suppose that the form of the waves travelling in the positive direction is periodic, that is to say, that after the wave has travelled forward a distance l , the position of every particle of the string is the same as it was at first, then l is called the wave-length, and the time of travelling a wave-length is called the periodic time, which we shall denote by T , so that

$$l = VT.$$

If we now suppose a set of waves similar to these, but reversed in position, to be travelling in the opposite direction, there will be a series of points, distant $\frac{1}{2}l$ from each other, at which there will be no motion of the string; it will therefore make no difference to the motion of the string if we suppose the string fastened to fixed supports at any two of these points, and we may then suppose the parts of the string beyond these points to be removed, as it cannot affect the motion of the part which is between them. We have thus arrived at the case of a uniform string stretched between two fixed supports, and we conclude that the motion of the string may be completely represented as the resultant of two sets of periodic waves travelling in opposite directions, their wave-lengths being either twice the distance between the fixed points or a submultiple of this wave-length, and the form of these waves, subject to this condition, being perfectly arbitrary.

To make the problem a definite one, we may suppose the initial displacement and velocity of every particle of the string given in terms of its distance from one end of the string, and from these data it is easy to calculate the form which is common to all the travelling waves. The form of the string at any subsequent time may then be deduced by calculating the positions of the two sets of waves at that time, and compounding their displacements.

Thus in the wave method the actual motion of the string is considered as the resultant of two wave motions, neither of which is of itself, and without the other, consistent with the condition that the ends of the string are fixed. Each of the wave motions is periodic with a wave-length equal to twice the distance between the fixed points, and the one set of waves is the reverse of the other in respect of displacement and velocity and direction of propagation; but, subject to these conditions, the form of the wave is perfectly arbitrary. The motion of a particle of the string, being determined by the two waves which pass over it in opposite directions, is of an equally arbitrary type.

In the harmonic method, on the other hand, the motion of the string is regarded as compounded of a series of vibratory motions which may be infinite in number, but each of which is perfectly definite in type, and is in fact a particular solution of the problem of the motion of a string with its ends fixed.

A simple harmonic motion is thus defined by Thomson and Tait (§ 53):—When a point Q moves uniformly in a circle, the perpendicular QP, drawn from its position at any instant to a fixed diameter AA' of the circle, intersects the diameter in a point P whose position changes by a *simple harmonic motion*.

The amplitude of a simple harmonic motion is the range on one side or the other of the middle point of the course.

The period of a simple harmonic motion is the time which elapses from any instant until the moving-point again moves in the same direction through the same position.

The phase of a simple harmonic motion at any instant is the fraction of the whole period which has elapsed since the moving point last passed through its middle position in the positive direction.

In the case of the stretched string, it is only in certain particular cases that the motion of a particle of the string is a simple harmonic motion. In these particular cases the form of the string at any instant is that of a curve of sines having the line joining the fixed points for its axis, and passing through these two points, and therefore having for its wave-length either twice the length of the string or some submultiple of this wave-length. The amplitude of the curve of sines is a simple harmonic function of the time, the period being either the fundamental period or some submultiple of the fundamental period. Every one of these modes of vibration is dynamically possible by itself, and any number of them may coexist independently of each other.

By a proper adjustment of the initial amplitude and phase of each of these modes of vibration, so that their resultant shall represent the initial state of the string, we obtain a new representation of the whole motion of the string, in which it is seen to be the resultant of a series of simple harmonic vibrations whose periods are the fundamental period and its submultiples. The determination of the amplitudes and phases of the several simple harmonic vibrations so as to satisfy the initial conditions is an example of harmonic analysis.

We have thus two methods of solving the partial differential equation of the motion of a string. The first, which we have called the wave method, exhibits the solution in the form containing an arbitrary function, the nature of which must be determined from the initial conditions. The second, or harmonic method, leads to a series of terms involving sines and cosines, the coefficients of which have to be determined. The harmonic method may be defined in a more general manner as a method by which the solution of any actual problem may be obtained as the sum or resultant of a number of terms, each of which is a solution of a particular case of the problem. The nature of these particular cases is defined by the condition that any one of them must be conjugate to any other.

The mathematical test of conjugacy is that the energy of the system arising from two of the harmonics existing together is equal to the sum of the energy arising from the two harmonics taken separately. In other words, no part of the energy depends on the product of the amplitudes of two different harmonics. When two modes of motion of the same system are conjugate to each other, the existence of one of them does not affect the other.

The simplest case of harmonic analysis, that of which the treatment of the vibrating string is an example, is completely investigated in what is known as Fourier's theorem.

Fourier's theorem asserts that any periodic function of a single variable period p , which does not become infinite at any phase, can be expanded in the form of a series consisting of a constant term, together with a double series of terms, one set involving cosines and the other sines of multiples of the phase.

Thus if $\phi(\xi)$ is a periodic function of the variable ξ having a period p , then it may be expanded as follows

$$\phi(\xi) = A_0 + \sum_1^{\infty} A_i \cos \frac{2i\pi\xi}{p} + \sum_1^{\infty} B_i \sin \frac{2i\pi\xi}{p} \dots (1).$$

The part of the theorem which is most frequently required, and which also is the easiest to investigate, is the determination of the values of the coefficients A_0 , A_i , B_i . These are

$$\begin{aligned} A_0 &= \frac{1}{p} \int_0^p \phi(\xi) d\xi; \\ A_i &= \frac{2}{p} \int_0^p \phi(\xi) \cos \frac{2i\pi\xi}{p} d\xi; \\ B_i &= \frac{2}{p} \int_0^p \phi(\xi) \sin \frac{2i\pi\xi}{p} d\xi. \end{aligned}$$

This part of the theorem may be verified at once by multiplying both sides of (1) by $d\xi$, by $\cos \frac{2i\pi\xi}{p} d\xi$, or by $\sin \frac{2i\pi\xi}{p} d\xi$, and in each case integrating from 0 to p .

The series is evidently single-valued for any given value of ξ . It cannot therefore represent a function of ξ which has more than one value, or which becomes imaginary for any value of ξ . It is convergent, approaching to the true value of $\phi(\xi)$ for all values of ξ such that if ξ varies infinitesimally the function also varies infinitesimally.

Sir W. Thomson, availing himself of the disk, globe, and cylinder integrating machine invented by his brother, Professor James Thomson, has constructed a machine by which eight of the integrals required for the expression of Fourier's series can be obtained simultaneously from the recorded trace of any periodically variable quantity, such as the height of the tide, the temperature or pressure of the atmosphere, or the intensity of the different components of terrestrial magnetism. If it were not on account of the waste of time, instead of having a curve drawn by the action of the tide, and the curve afterwards acted on by the machine, the time axis of the machine itself might be driven by a clock, and the tide itself might work the second variable of the machine, but this would involve the constant presence of an expensive machine at every tidal station.

It would not be devoid of interest, had we opportunity for it, to trace the analogy between these mathematical and mechanical methods of harmonic analysis and the dynamical processes which go on when a compound ray of light is analysed into its simple vibrations by a prism, when a particular overtone is selected from a complex tone by a resonator, and when the anormously complicated sound-wave of an orchestra, or even the discordant clamours of a crowd, are interpreted into intelligible music or language by the attentive listener, armed with the harp of three thousand strings, the resonance of which, as it hangs in the gateway of his ear, discriminates the multifold components of the waves of the aerial ocean. (J. C. M.)

HARMONIUM. Perhaps no musical instrument ever became in a few years so widely known and used as the harmonium. The reasons for this may at once be found in the facilities it offers for playing easy music, and, when simply constructed, its comparatively low price, which renders the purchase of a tolerable harmonium possible when the cheapest pianoforte fairly playable would be unattainable, and the real organ, although of chamber size, quite out of the question. Besides being a convenient makeshift for an organ, the harmonium can also be used in domestic concerted music, to play all or any of the wind band parts of the orchestra; it may even be employed as a substitute for the violin, and in such vicarious uses it is past all question one of the handiest of deputies.

It is true the tone of the harmonium is not in itself beautiful; the prominence in sounds from reeds of certain overtones is irreconcilable with pleasure to the ear unless by convention of habit, and the necessity of tuning according to equal temperament all major thirds too sharp leads through this harmonic peculiarity in the chords to an abnormally disagreeable quality, from which those whose nerves are very sensitive or weak are not unfrequently painfully affected. The American organ, a kind of harmonium of late years much in vogue, owes its popularity to its being less pronounced and reedy in timbre (its softer tone being nearer to that we are familiar with in the church organ), and to its being easier to play for simple domestic use. Yet the real harmonium has more independent character as an instrument, and is capable of higher treatment in performance than the American organ.

Both are known as "free-reed" instruments, the musical tones being produced by tongues of brass, technically "vibrators," set in oblong frames; the sides of these they do not quite touch, but pass, when in movement, freely downwards,—the "beating reeds" used in church organs covering the entire orifice. A reed or vibrator, set in periodic motion by impact of a current of air, produces a corresponding succession of air puffs, the rapidity of which determines the pitch of the musical note. There is an essential difference between the harmonium and the American organ in the direction of this current; in the former the wind apparatus forces the current upwards, and in the latter sucks it downwards, whence it becomes desirable to separate in description these varieties of free-reed instruments.

The *Harmonium* has a keyboard of five octaves compass when complete, from C to C, and a simple action controlling the valves, &c. The necessary pressure of wind is generated by bellows worked by the feet of the performer upon footboards or treadles. The air is thus forced up the wind-trunks into an air-chamber called the wind-chest, the pressure of it being equalized by a reservoir, which receives the excess of wind through an aperture, and permits escape, when above a certain pressure, by a discharge valve or pallet. The aperture admitting air to the reservoir may be closed by a drawstop named "expression." The character of the instrument is then entirely changed from a mechanical response to the player's touch to an expressive one, rendering what emotion may be communicated from the player by increase or diminution of sound through the greater or less pressure of wind the reeds may be submitted to. The drawstops bearing the names of the different registers in imitation of the organ, admit, when drawn, the wind from the wind-chest to the corresponding reed compartments, shutting them off when closed. These compartments are of about two octaves and a half each, there being a division in the middle of the keyboard scale dividing the stops into bass and treble. A stop being drawn and a key pressed down wind is admitted by a corresponding valve to a reed or vibrator. Above each reed in the so-called sound-board or pan is a channel, a small air-chamber or cavity, the shape and capacity of which have greatly to do with the colour of tone of the note it reinforces. The air in this resonator is highly compressed at an even or a varying pressure as the expression-stop may not be or may be drawn. The wind finally escapes by a small pallet-hole opened by pressing down the corresponding key. In Mustel and other good harmoniums, the reed compartments that form the scheme of the instrument are eight in number, four bass and four treble, of three different pitches of octaves and double octave dis-

tance. The front bass and treble rows are the "diapason" of the pitch known as 8 feet, and the bourdon (double diapason), 16 feet. These may be regarded as the foundation stops, and are technically the front organ. The back organ has solo and combination stops, the principal of 4 feet (octave higher than diapason), and bassoon (bass) and oboe (treble), 8 feet. These may be mechanically combined by a stop called full organ. M. Mustel, the French maker, whose pre-eminence is universally acknowledged, has added other registers for much admired effects of tone, viz.,—"harpe éolienne," two bass rows of 2 feet pitch, the one tuned a beat too sharp, the other a beat too flat, to produce a waving tremulous tone that has a certain charm; "musetto" and "voix celeste," 16 feet; and "baryton," a treble stop 32 feet, or two octaves lower than the normal note of the key. The "back organ" is usually covered by a swell box, containing louvres or shutters similar to a Venetian blind, and divided into fortes corresponding with the bass and treble division of the registers. The fortes are governed by knee pedals which act by pneumatic pressure. Tuning the reeds is effected by scraping them at the point to sharpen them, or near the shoulder or heel to flatten them in pitch. Air pressure affects the pitch but slightly, noticeable only in the larger reeds, and harmoniums long retain their tuning, a decided advantage over the organ and the pianoforte. Mechanical contrivances in the harmonium, of frequent or occasional employment, besides those already referred to, are the "percussion," a small pianoforte action of hammer and escapement which, acting upon the reeds of the diapason rows at the moment air is admitted to them, gives prompter response to the depression of the key, or quicker speech; the "double expression," a pneumatic balance in the wind reservoir of great delicacy exactly maintaining by gradation equal pressure of the wind; and the "double touch," by which the back organ registers speak sooner than those of the front that are called upon by deeper pressure of the key, thus allow prominence or accentuation of certain parts by an expert performer. "Prolongement" permits selected notes to be sustained after the fingers have quitted their keys. Dawes's "melody attachment" is to give prominence to an air or treble part by shutting off in certain registers all notes below it. This notion has been adapted by inversion to a "pedal substitute" to strengthen the lowest bass notes. The "tremolo" affects the wind in the vicinity of the reeds by small bellows which increase the pulsation in rapidity according to pressure; and the "sourdine" diminishes the supply of wind by controlling its admission to the reeds.

The *American Organ*, as already said, acts by wind exhaustion. A vacuum is practically created in the air-chamber by the exhausting power of the footboards, and a current of air thus drawn downwards passes through any reeds that are left open, setting them in vibration. This instrument has therefore exhaust instead of force bellows. Valves in the board above the air-chamber give communication to reeds, made more slender than those of the harmonium and more or less bent, while the frames in which they are fixed are also differently shaped, being hollowed rather in spoon fashion. The channels, the resonators above the reeds, are not varied in size or shape as in the harmonium; they exactly correspond with the reeds, and are collectively known as the "tube-board." The swell "fortes" are in front of the openings of these tubes, rails that open or close by the action of the knees upon what may be called knee pedals. The tone of the American organ is softer than that of the harmonium; this is sometimes aided by the use of extra resonators, as, for instance, in Clough and Warren's latest instruments (of Detroit, Michigan, U.S.), which they call pipes or qualifying tubes. The blowing being also easier, ladies find it much less fatiguing. To these differences we may attribute its increasing popularity. The expression stop can have little power in the American organ, and is generally absent; the "automatic swell" in the instruments of Mason and Hamlin (of Boston, U.S.) is a contrivance that comes the nearest to it, though far inferior. By it a swell shutter or rail is kept in constant movement, proportioned to the force of the air-current. Another very clever improvement introduced by these makers, who are the originators of the instrument itself, is the "vox humana," a smaller rail or fan, made to revolve rapidly by wind pressure; its rotation, disturbing the air near the reeds, causes interferences of vibration that produce a tremulous effect, not unlike the beatings heard from combined voices, whence the name. This vibrato stop has found general adoption. The arrangement of reed compartments in American organs does not essentially differ from that of harmoniums; but there are often two keyboards, and then the solo and combination stops are found on the upper manual. The diapason treble register is known as "melodia"—different makers occasionally vary the use of fancy names for other stops. The "subbass," however, an octave of 16 feet pitch and always apart from the other reeds, is used with great advantage for pedal effects on the manual, the compass of American organs being usually down to F (FF, 5 octaves). In large instruments there are sometimes foot pedals as in an organ, with their own reed boxes of 8 and 16 feet, the lowest note being then CC. Blowing for pedal instruments has to be done by hand a

lever being attached for that purpose. The "celest" stop is managed as in the harmonium, by rows of reeds, tuned not quite in unison, or by a shade valve that alters the air-current and flattens one row of reeds thereby.

Harmoniums and American organs are the results of many experiments to play upon free reeds by a keyboard, initiated by the "orgue expressif" of Grenié, a Frenchman. During nearly the first half of this century various tentative efforts in France and Germany, and subsequently in England, came to nothing more valuable than the Viennese "physharmonica" of Häckel, the Parisian "melophone," and our own "seraphine." The inventor of the harmonium was indubitably Alexandre Debain, who took out a patent for it in Paris in 1840. He produced varied timbre registers by modifying reed channels, and brought these registers on to one keyboard. Unfortunately he patented too much, for he secured even the name harmonium, obliging contemporary and future experimenters to shelter their improvements under other names, and the venerable name of organ becoming impressed into connexion with an inferior instrument, we have now to distinguish between reed and pipe organs. The compromise of reed organ for the harmonium class of instruments must therefore be accepted. Debain's harmonium was at first quite mechanical; it gained expression by the expression-stop already described. The Alexandres, well-known French makers, by the ingenuity of one of their workmen, Martin, added the percussion and the prolongement. The melody attachment was the invention of an English engineer; the introduction of the double touch, now used in the harmoniums of Mustel, Bauer, and others—also in American organs—is due to Mr Tamplin, an English professor. Reference has already been made to the improvements of M. Mustel, a maker imbued with true artistic devotion.

The principle of the American organ originated with the Alexandres, whose earliest experiments are said to have been made with the view of constructing an instrument to exhaust air. The realization of the idea proving to be more in consonance with the genius of the American people, to whom what we may call the devotional tone of the instrument appealed, the introduction of it by Messrs Mason and Hamlin in 1861 was followed by remarkable success. They made it generally known in Europe by exhibiting it at Paris in 1867, and from that time instruments have been exported in large numbers by different makers. Harmoniums are not entirely, although chiefly, of French make. Mr Bauer, one of the best English makers, learned the trade in Paris, and employs chiefly French workmen. As keyed instruments, reed organs of either principle cannot be expected to compete musically with the older organ and pianoforte, yet the harmonium, studied for itself with something like the devotion that is given to the other keyed instruments, might be made more important than it is at present. Excepting from a few isolated students who may be told upon the fingers, it has received no true cultivation. Whether it will ever get this is a question that remains to be answered. Commercially the harmonium and American organ have taken a much more important place, although of course one not equal to that of the pianoforte. For some years the Alexandres were sending annually 7000 harmoniums to England. This afterwards, from various causes, diminished; the number, however, of their instruments made up to 1879 has reached 110,000. A general estimate of harmoniums made annually in France, Germany, and England is not forthcoming; but the yearly production of American organs in the United States has been stated at the large total of 40,000.

HARMONY. See ACOUSTICS and MUSIC.

HARO, said to be the ancient *Castrum Bilium*, a town of Spain, is situated in the province of Logroño, and the bishopric of Calahorra, 12 miles S.E. of Miranda, and 58 miles N. of Madrid. It occupies a beautiful site near the Ebro, in a fertile plain, bounded by a range of mountains. The town contains a fine parish church, a theatre built in 1841, a hospital, and other public buildings. Various unimportant manufactures are carried on by the inhabitants; but the chief source of wealth is the red wine produced in great abundance from the vines of the surrounding plain. There are some copper mines in the neighbourhood. Haro was the birthplace of Diego de Leyva, the celebrated painter, about 1580. The population was estimated for 1870 at 6594.

HAROLD I., surnamed Fairhaired (Harald Haarfager) the founder of the old royal dynasty of Norway, succeeded his father, Halfdan the Black, as jarl about the year 863. His ambition to become king is said to have been awakened by the refusal of Gyda, daughter of Eric of Hadaland, to marry him until he had made himself ruler of all Norway, as Gorm had of Denmark, and Eric of Sweden; and he vowed that he would never clip nor comb his hair until he had fully achieved his task. After he had subdued all the jarls, he sent for Gyda and made her one of his wives, and had his hair cut at a feast in Möre by Jarl Rögnwald, who then gave him the name of *Haarfager*. During the wars of Harold with the jarls many of the Norsemen left their country and settled in Iceland, the Faroe Islands, the Orkney and Shetland Islands, and even in the Hebrides of Scotland, from whence they returned and committed many sea robberies in Norway. Harold therefore fitted out a great expedition, conquered and slew the vikings, and made himself ruler over all these Norse settlements. During his absence on another expedition against Jarl Einar of Orkney his sons made war on one another, and also committed many acts of violence against his jarls. Accordingly on his return, finding it difficult to keep them in check, Harold resolved to give them separate provinces to govern, and about the year 893 called together a great "thing," at which he conferred on each the title of king, with a seat higher than that of the jarls, he himself retaining the sovereignty of the whole country. He also made Eric Bloodyaxe his heir, and took him to live with him; and about his eightieth year, when he found himself no longer able to discharge his kingly duties, he transferred the whole government to Eric and gave him the royal seat. Harold died three years afterwards about the year 933.

HAROLD II. surnamed Greyskin (Harald Graafel), son of Eric Bloodyaxe, succeeded Haco the Good in the government of Norway about the year 960, having bribed his other brothers to be satisfied with reigning as under kings in the other provinces. It would appear that Harold himself was disposed to govern peacefully and well, but his brothers now resolved to take vengeance on the friends of the late King Haco, and murdered among others Jarl Sigurd. They, however, failed of their purpose on Haco, his son, who after for some time resisting their attacks fled to Denmark, where he obtained the assistance of King Harold Bluetooth, with whose help he defeated and slew Harold Greyskin, upon which, under Harold Bluetooth, he became ruler of Norway with the title of jarl, according to some in the year 965, to others in 969, and to others in 975.

HAROLD III. surnamed Stern in Council (Harald Haardraade or Hardrada), son of Jarl Sigurd, half-brother of King Olaf the Holy, and descended by his father from Harold I., was one of the most distinguished warriors among the old Norse kings. About his fifteenth year he made his escape wounded from the battle of Stiklestad (1030), where his half-brother Olaf was killed; and after staying till he was cured of his wounds with a "bonde" in a

forest, he made his way to Sweden, whence after the winter was over he went to Russia, where he was kindly received by King Yaroslaf of Novgorod. He remained in Russia for several years, but, being refused the hand of a Russian princess, he betook himself with several companions to Constantinople, and became chief commander of the famous Byzantine life-guards known as Varangians, and consisting almost wholly of Norsemen. At the head of these warriors he gained many victories over the Saracens in Sicily and Italy. It is even said that in a crusade against the infidels he penetrated as far as Jerusalem, but most probably if he entered that city it was in the peaceful character of a pilgrim. Returning after his exploits to Constantinople, he was refused the hand of a niece of the empress Zoe, because, according to the legend, the empress herself was enamoured of him; and offended at the refusal he one night made his escape with two galleys, carrying with him all his treasures, and also it is said the princess whose hand had been denied him, whom, however, he put on shore after he had passed the Bosphorus, with a message to the empress that, if he had so willed, her power would have been vain against his strategy and skill. He now set sail for Russia, where he was warmly welcomed by King Yaroslaf; and as he was now a man of great fame and wealth Yaroslaf gave him in marriage his daughter Ellisof or Elizabeth, whose hand he had formerly asked in vain. Soon after his marriage he resolved to return home and if possible to win the crown of Norway from his nephew Magnus the Good. With that purpose he about the year 1045 came to an agreement with his relative Swend of Denmark, who had been driven by Magnus into exile in Sweden; but Magnus, having obtained news of the intended joint expedition against him, entered into communication with Harold, and agreed to share with him the government of Norway, each ruling over a separate division. They now turned their united forces against Swend, drove him from Denmark, and completely prostrated his power; but just when he had resolved finally in despair to give up the contest, Magnus about the year 1047 took suddenly ill and died, bequeathing on his death-bed the whole of Norway to Harold and Denmark to Swend. Such a bequest did not however coincide with the desires of Harold, and between him and Swend a constant warfare raged for several years, until in 1064 they agreed to a peace by which each retained his dominions according to the old established boundaries. The chief motive of Harold in consenting to this arrangement was probably that he might be free to embark on a purpose of wider ambition, namely, to revive in his own person the old Scandinavian sovereignty of England which had ended with the death of Hardicanute. The story goes that he was instigated to the enterprise by a visit from Tostig, the exiled earl of Northumbria; but whether that be so or not, he in 1066 set sail for England with an immense fleet, which carried his wife Ellisof, his son Olaf, his treasures, and more than half of all his fighting men. After touching at Orkney, where he left his wife, he proceeded southwards to the Tyne, and was there joined by Tostig and by a contingent of troops from Malcolm of Scotland. From the Tyne they sailed southwards along the coast of Yorkshire, stopping at intervals to ravage the country for provisions, and after proceeding up the Humber east anchor on the left bank of the Ouse near the village of Riccall. Leaving a detachment under his son Olaf to guard the fleet, Harold along with Tostig marched with a great force towards York, and, defeating the Northumbrians with heavy loss at Fulford on September 20th, received the surrender of the city on September 24th. Meanwhile Harold of England, having heard of the Norse invasion, was marching northwards from London day and night with an immense army; and passing through York on the day after its surrender, he

appeared suddenly on the afternoon before the Norsemen encamped at Stamfordbridge. Taken by surprise, the Norsemen fought nevertheless with stubborn courage and fierce energy, but though the battle was for some time doubtful it ended at nightfall in their total overthrow, with a slaughter so enormous that the great majority of them lay dead upon the field. Tostig was slain and also Harold Hardrada himself, who, towering head and shoulders above all his warriors, was inflicting death on all who dared to meet him, till struck by an arrow in the windpipe he received the wound which laid him low. According to some writers his body ultimately found burial in Norway.

HAROLD IV., king of Norway, surnamed Gille,—said to be the short form of Gylle Kirst, that is, Servant of Christ,—came about the year 1127 to Norway with his mother, an Irishwoman, and claimed to be recognized as the son of King Magnus Barefoot and half-brother of the reigning Sigurd. Sigurd consented to acknowledge the relationship on condition that Harold did not claim any share in the government during his lifetime or that of his son Magnus. This agreement Harold honourably kept during the lifetime of Sigurd, but after his death in 1130 he got himself chosen king of the half of the country, and after several battles took Magnus prisoner, put out his eyes, and confined him in a convent. Harold now reigned as sole king till 1136, when he was murdered in his sleep by Slembi-diakn, another bastard son of Magnus Barefoot.

For the Norwegian Harolds, see the *Heimskringla* of Snorro Sturleson, translated into English by Samuel Laing, London, 1844; *Sturlunga Saga*, 2 vols., Oxford, 1878; Carlyle's *Early Kings of Norway*, London, 1875; and also, for Harold Hardrada, Freeman's *Norman Conquest*, vols. ii. and iii.

HAROLD I., surnamed Harefoot, king of England, illegitimate son of Canute and Alfgiva of Northampton, was on the death of Canute in 1035 chosen by the witan overlord of England and king of the provinces north of the Thames; and in 1037 he became king of England, when the people of Wessex offered him their crown on Hardicanute refusing to come to England to accept it. In the beginning of Harold's reign Alfred, son of Ethelred, landed in Wessex, with the purpose it is said of asserting his claims to its sovereignty; but, either without the knowledge of Earl Godwine, or with his connivance, he was seized by the agents of Harold and put to death with cruel tortures. Harold also banished Queen Emma from the kingdom. The only other events of importance in his reign are inroads of the Welsh and Scots, which were, however, without effectual results, and in the case of the Scots who laid siege to Durham ended in defeat with heavy loss. Harold died at Oxford, March 10, 1040. It is affirmed by some that Harold made no pretensions to a Christian belief, but this seems an exaggeration, for, whatever may have been his own private opinions, he appears to have conformed generally to the recognized religious customs, and there is one instance at least in which he redressed a wrong done by others to the church.

HAROLD II., king of the English, was the second son of Earl Godwine and his Danish wife Gytha, the sister of Earl Ulf. The year of his birth is not accurately fixed, but it must have been about 1022. The choice of his name, like that of some others of his brothers and sisters (see GODWINE), witnesses to the influence of his Danish mother. Both he and his elder brother Swegen were appointed to earldoms while still very young, seemingly about 1045. Harold's earldom was that of the East-Angles. In 1046 Swegen, having carried off Eadgifu, abbess of Leominster, and not being allowed to marry her, threw up his earldom in disgust, and his possessions were divided between his brother Harold and his cousin Earl Beorn, the nephew of Gytha. In 1049 Swegen came back and sought the recovery of his lands, which was refused by

Harold and Beorn. Harold now appears for the first time in command, holding a ship in the fleet commanded by his father. For some unknown cause his ship was transferred to Beorn, which most likely saved Harold's life; for Swegen presently came and entrapped and slew Beorn, who was buried by Harold. We next hear of Harold in 1051 as accompanying Godwine when he appeared in arms in Gloucestershire. He shared his father's outlawry and banishment in that year, but he chose a different place of shelter, going with his brother Leofwine to Ireland, while Godwine went to Flanders. In 1052 Harold and Leofwine came back. They were opposed by the men of Somerset and Devonshire, whom they defeated at Porlock, and plundered the country. Then they joined their father, and were with him at the assembly which decreed the restoration of the whole family. Harold was now restored to his earldom of the East-Angles, and, on his father's death in 1053, he succeeded him in the greater earldom of the West-Saxons.

Harold was now the chief man in the kingdom, and when the older earls Leofric and Siward died, his power increased yet more, and the latter part of Eadward's reign was virtually the reign of Harold. But he was the minister of the king rather than his personal favourite. This last place rather belonged to his younger brother Tostig, who on the death of Siward in 1055 received the earldom of the Northumbrians. Two other of Godwine's younger sons, Gyrth and Leofwine, also received earldoms in 1057. This last date would seem to have been about the time when the prospect of the crown began to open to Harold. The Ætheling Eadward, the son of Eadmund Ironside, who had been brought home from Hungary as the intended successor, died that year. So did Eadward's nephew Ralph, who, though not really of the kingly house, might possibly have been looked to for lack of a nearer candidate. There was now no one of the old stock but Eadgar son of Eadward and his sisters. If then the king should die while Eadgar was still a child, there would be no qualified candidate in the royal house. It would seem as if, from this time, men began to look to Earl Harold as a possible successor to the crown. He is spoken of in a way, and his name is joined with that of the king in a way, which is unusual in the case of an ordinary earl.

The chief events in which Harold appears personally during this time are the wars with the Welsh under their king Gruffydd ap Llywelyn. In 1055, in alliance with the banished Earl Ælfgar of Mercia, Gruffydd defeated Earl Ralph and burned Hereford. Harold now drove back the Welsh and restored Hereford, but allowed the restoration of Ælfgar to his earldom. In 1058 he made the pilgrimage to Rome; in 1060 he completed the building of his church at Waltham, and completed the foundation of the college in 1062. In 1063 came the great Welsh war, in which Harold, with the help of his brother Tostig, crushed the power of Gruffydd, who was killed by his own people. Harold now gave Wales to two vassal kings, Bleddyn and Rhiwallon. Both of his wars were accompanied by an extension of the English frontier toward Wales. In 1065 the Northumbrians revolted against their earl Tostig, and chose in his place Morkere, the son of Ælfgar. Harold now acted as mediator between the king and the insurgents, and at last, as the Northumbrians were fully prepared not to receive Tostig again, he agreed to their choice of Morkere and to the banishment of his brother.

Besides these there is one very important event in Harold's life the date of which can only be guessed at. At some time or other between William's visit to England in 1051 and Eadward's death at the beginning of 1066, Harold was the guest of Duke William in Normandy, and took some kind of oath to him. This oath the Normans

represented as an act of homage, with a further oath to procure William's succession to the English crown. The tale is told only by the Norman writers, and it is told by them with such contradictions of every kind that no reliance can be placed on any detail. But that there is some truth in the story is proved by the strongest negative evidence. While the contemporary English writers take care, directly or indirectly, to deny all those Norman charges against Harold which were sheer invention, they say not a word as to his alleged oath to William. It seems on the whole most likely that Harold was wrecked on the shore of Ponthieu, imprisoned by its Count Guy, and released by the interference of William. He then helped William in a war with the Bretons, and promised to marry one of his daughters. This was most likely accompanied by an act of homage, such as was often made to any superior or benefactor. Such an oath might, in the ideas of the times, be made to mean a great deal or very little, according to circumstances. The most likely date is 1064. But there is a remarkable statement that Harold took a journey in Gaul with a political object, seemingly that of making alliances with some of the princes of the country, most likely William's enemies in France, Anjou, and Aquitaine. This was in the year of his Roman pilgrimage. And, as there is no direct evidence for the date of the oath, it is open to any one to put the two things together.

At the beginning of 1066 Eadward died. His last act was to recommend Harold for election to the crown. He was accordingly chosen on the day of Eadward's death, January 5th, and crowned the next day by Ealdred, archbishop of York. But, though he was crowned by the Northumbrian primate, the men of Northumberland at first refused to acknowledge him. They were won over by the new king, who went to York, accompanied by Saint Wulfstan, bishop of Worcester. To secure Eadwine and Morkere, he married their sister Ealdgyth, the widow of the Welsh king Gruffydd. He thus put it out of his power to comply with that part of his engagement to William which is best attested, namely, to marry one of William's daughters. The rest of Harold's reign was taken up with preparations against the attacks of two enemies at once. William challenged the crown, alleging both a bequest of Eadward in his favour and the personal engagement which Harold had contracted towards him. This was of course a mere matter of form, and William began to make ready for the invasion of England. Meanwhile the banished Tostig was trying all means to bring about his own restoration. He first, seemingly in concert with William, came in May, and attacked first the Isle of Wight and then Lindesey, but was driven to take shelter in Scotland. From May to September the king kept the coasts with a great force by sea and land; but at last provisions failed, and the land army was dispersed. Harold then went to London, ready to meet whichever enemy came first. By this time Tostig had engaged Harold Hardrada of Norway to invade England. He accordingly sailed up the Humber, defeated Eadwine and Morkere (September 20th), and received the submission of York (September 24th). Harold of England was now on his march northward; on September 25th he came on the Northmen at Stamfordbridge beyond York, and won a complete victory, in which Tostig and Harold Hardrada were slain. But two days later (September 27th) William of Normandy landed at Pevensey and (September 29th) occupied Hastings, and laid waste the land. Harold had then to march southward as fast as possible. He gathered his army in London from all southern and eastern England, but Eadwine and Morkere kept back the forces of the north. The king then marched into Sussex, occupied the hill of Senlac, now Battle, and awaited the Norman attack. After a vain exchange

of messages, the decisive battle was fought on October 14th. As the English were wholly infantry, while the Normans were strongest in cavalry and archers, Harold's object was simply to hold the hill against all attack. As long as he was obeyed, his tactics were completely successful. But a part of his troops, disobeying his orders, left the hill to pursue, and the English array was broken. The Normans could now get up the hill, and, after a fight which lasted from morning till evening, they had the victory. The king and his brothers Gyrth and Leofwinc were killed. As Harold was condemned by the pope, William at first refused him Christian burial, and caused him to be buried on the rocks at Hastings. But it seems most likely that he afterwards allowed the body to be removed to Harold's own church at Waltham. The tale which represents Harold as escaping from the battle, living a life of penitence, and at last dying at Chester, is a mere romance.

Harold left several children, but there is a good deal of uncertainty as to his marriage or marriages. He had two sons by Ealdgyth, Harold and Wulf; but they must have been twins born after their father's death. He had also three sons, Godwine, Eadmund, and Magnus, and two daughters, Gytha and Gunhild. It will be seen how strong the Scandinavian element is in these names. These five were not children of Ealdgyth, and the sons were grown up, or nearly so, when their father died. They may have been the children of an unrecorded first wife. But the local history of Waltham represented Harold's body as being found after the battle by a former mistress of his, Eadgyth Swanneshals (Swansneck). Some have thought that this Eadgyth is the "Eddeva pulcra" of Domesday, who appears as the former holder of great estates in the east of England. This, though not unlikely, is quite uncertain; but there seems evidence enough to show that Eadgyth Swanneshals is a real person, and to connect her with Harold's East-Anglian earldom. It seems most likely that she was the mother of Harold's earlier children, and that the connexion between them was that intermediate state between marriage and concubinage called the Danish marriage, of which we not uncommonly hear in those days.

The character of Harold is blackened with many, but mostly very vague, charges by the Norman writers. The English, on the other hand, paint him as the perfect model of a ruler. With regard to his accession to the crown, the common charge of usurpation springs from ignorance of the English law of the time. Harold was beyond all doubt regularly nominated by Eadward, regularly chosen by the witan, and regularly crowned by Ealdred. This last point is of importance in those days, when the rite of coronation was deemed of such moment. The Normans try to represent the ceremony as invalid, by saying that Harold was crowned by Stigand, archbishop of Canterbury, whose canonical position was doubtful. That Harold crowned himself, instead of receiving the ecclesiastical consecration, is a mere fable, arising from a misunderstanding of some of the rhetorical invectives of the Norman writers. It should be noticed that those contemporary writers who speak of Harold as an usurper do so wholly on the ground of the alleged right of William, and of Harold's oath to William. That Harold's accession was a wrong done to young Eadgar is an idea which we first hear of in the next century, when the doctrine of hereditary right had taken firmer root. In Domesday the reign of Harold is passed by; he is regularly spoken of as earl; the doctrine of the Norman lawyers was that William, though of course not full king till his coronation, had the sole right to the crown from the moment of Eadward's death.

The military skill of Harold is plain, both from the Welsh war, when he overcame the mountaineers by making his English soldiers adopt the Welsh tactics, and from his

conduct both at Stamfordbridge and at Senlac. He clearly understood the difference between his two enemies, when it was wise to attack and when it was wise to await the attack. At Stamfordbridge his strategy was perfectly successful; it failed at Senlac only because of the disobedience of part of his army. The best witness to his civil government is the general peace and good order of England during that part of the reign of Eadward which was virtually his reign. When the peace is broken, it is always by the act of others, and Harold is always called on to make the settlement. He appears throughout as singularly mild and conciliating, never pressing hard upon any enemy. The later Norman writers indeed have an elaborate tale which represents Harold and Tostig as enemies from their childhood. But this is mere romance, with no ground in any contemporary writer.

The relations of Harold to the church, always an important feature in the character of a prince of that age, suggest several questions. He is charged in Domesday with several encroachments on ecclesiastical property, chiefly in Herefordshire, and the like charge is brought against him in a deed of Leofric, bishop of Exeter. But it must be remembered that this kind of charge is brought against every leading man of the time, and that we very seldom hear more than one side. The most distinct and detailed charge, that which represents Harold as a wholesale spoiler of the church of Wells, can be refuted, not by hearing the other side, but by going back to the charge as brought by the original complainant, Bishop Gisa. We here find that Harold took nothing from the church, but simply hindered the bishopric from receiving a bequest to which there is some reason for thinking that he may have had a right as earl. On the other hand, Harold appears as the friend and protector of several ecclesiastical bodies, and above all as the founder of Waltham. Here we may remark that, when monks were all the fashion, he preferred the secular clergy. He was the firm friend of the best prelate of his time, Bishop Wulfstan, and he appeared on good terms with most of the leading churchmen.

The contemporary authorities are the English Chronicles, the Latin biographer of Eadward in Dr Luard's collection (he gives a splendid panegyric on Harold), and Florence of Worcester, on the English side. On the Norman side are the Bayeux Tapestry, William of Poitiers, William of Jumièges, Gny of Amiens (*Cornu de Bello Hastingsensi*). In the next century the book *De Inventione Sancte Crucis Walthamensis* gives Harold's picture as drawn in his own foundation. The book called *Vita Haroldi* is a mere romance, but contains one or two scraps of authentic tradition; Orderic, Eadmer, William of Malmesbury, and the writers of the 12th century generally, often prove particular facts, and especially show how the estimate of the events of the 11th century gradually changed. The French life of Eadward in the 13th is very bitter against Harold. Of the Scandinavian writers, Saxo Grammaticus is violent against him, while the biographer of Olaf Trygvesson counts him for a saint. All the statements are brought together and examined in Freeman's *History of the Norman Conquest*, vols. ii. and iii. The opposite pictures of the earlier writers, Thierry and Palgrave, are also worth comparing. (E. A. F.)

HAROUN AL RASCHID, more properly Harún er Rashid, "Aaron the Orthodox," was the fifth of the 'Abbaside caliphs of Bagdad. His full name was Harún 'bn Mohammed ibn Abdallah ibn Mohammed ibn Ali 'bn 'Abdallah ibn Abbás. He was born at Ray the last day of Dhi'l Heggah, 145 A.H. (20th March 763 A.D.) according to some accounts, and according to others 1st Moharrem 149 A.H. (15th Feb. 766 A.D.). Haroun al Raschid was twenty-two years old when he ascended the throne. His biographers unanimously speak of him as "the most accomplished, eloquent, and generous of the caliphs;" but, though his name is a household word, and few figures stand out more grandly prominent in the history of their times, little is really popularly known about his private life and personal history.

Raschid owed his own succession to the throne entirely to the prudence and sagacity of Yahya 'bn Khalid ibn Barmek, his secretary,¹ whom, on his accession, he appointed his lieutenant and grand vizier. Yahya, upon whom the whole responsibility of the government really devolved, performed his duties with the most consummate ability and judgment. He fortified the frontiers, and repaired all the deficiencies in the administration of the empire. He filled the treasury, made the provinces flourishing and prosperous by encouraging trade and securing the public safety, and in a word brought the caliphate up to the highest pitch of prosperity and glory. He personally superintended and organized the whole system of government. As a minister he was eloquent, wise, accomplished, and prudent, and he was moreover an able administrator, ruling with a firm hand and proving himself able to cope with any emergency that might arise. His generosity was munificent in the extreme and gained for him universal encomiums. With a most affable demeanour and great moderation he combined an imposing dignity that commanded universal respect.

In 182 A.H. (798 A.D.) Al Raschid proclaimed his son 'Abdallah as his heir apparent after El Amn, his eldest son, whom he had appointed his successor when only five years old, and gave him the post of viceroy of Khorassan. It was on this occasion that he gave 'Abdallah the name of El Mamun and confided him to the care of Jafer, son of Yahya. The historians speak of this act of Raschid's with natural surprise, for he had seen the results of similar policy on the part of his father and of his grandfather, as well as what his brother Hadi had done in his own case.

Yahya, the prime minister, and Jafer, his son, enjoyed so fully the confidence of Haroun al Raschid that they rapidly rose to wealth and power. The great popularity and influence of the Barmek or Barmecide family, however, at length aroused the caliph's jealousy, and to make matters worse he heard that Jafer had secretly married his sister. No sooner had he been made acquainted with the facts than he caused his sister to be put to death, ordered Mesrur, his slave and executioner, to bring him Jafer's head, and next murdered his two inoffending young nephews.

After the fall of the Barmek family the office of prime minister was exercised by Fadhl ibn Rabi' who had been

¹ According to the Mahometan law of succession the eldest brother or male relative of the reigning monarch is the heir apparent to the throne, and almost all Muslim princes have endeavoured to set aside the claims of their relatives in favour of their own children. El Hadi, Haroun's brother, was no exception to the rule, and conceived the idea of stripping Haroun of his rights and proclaiming his own son Jafer as his successor. Yahya was then Haroun's secretary, and expected to exercise the important office of vizier if ever his master should mount the throne. Hadi saw that his first step must be to conciliate Yahya; he therefore took him apart, and having given him a present of 20,000 dinars began to broach the subject nearest his heart. Yahya, however, brought a very strong argument to bear upon the point: "If you do so, Prince of the Faithful," said he, "you will set your subjects an example of breaking an oath and disregarding a contract, and other people will be bold enough to do the same. But if you leave your brother Haroun in possession of his title of heir apparent and appoint your son Jafer as next in succession to him, it will be much more likely to secure his ultimate accession to the throne." Hadi allowed the matter to rest for some time, but at length paternal affection got the better of him, and he again summoned Yahya into his presence and consulted him, and Yahya urged that if the caliph should die while Jafer was yet a child the chiefs of the imperial family would never recognize the validity of his succession. Hadi having acknowledged the truth of this, Yahya continued, "Renounce then this project, in order the better to arrive at the consummation of your wishes. Even if your father El Mehdi had not appointed Haroun to succeed you it would be policy on your part to do so, inasmuch as that is the only way to ensure the continuance of the caliphate in the family of the Beni Hashem." Raschid ever afterwards acknowledged this as the greatest obligation which he owed to Yahya.

chamberlain to Haroun himself, and to his predecessors Mensur, Mehdi, and Hadi. He held the office of vizier until the death of Haroun al Raschid himself, which occurred at Tus, the birthplace of the celebrated Persian epic poet Firdousi. Al Raschid had set out for Khorassan to put down the insurrection of Rafi' ibn Leith ibn Nasr ibn Sayyar, who had revolted against his authority, made himself master of Samarcand, and killed the governor of that province. The rising had assumed such alarming proportions that Al Raschid determined to march in person against the rebels. He had not, however, got further than Tus when he was surprised by death in 193 A.H. (808-9 A.D.).

The reign of Al Raschid was one of the most brilliant in the annals of the caliphate, and the limits of the empire were then more widely extended than at any other period. The greater part of the Eastern world submitted to his laws, and paid tribute into his treasury; Egypt itself was only a province under his sway, and its ruler an officer appointed by himself. No caliph ever gathered round him so great a number of learned men, poets, jurists, grammarians, cadis, and scribes, to say nothing of the wits and musicians who enjoyed his patronage. Haroun himself was an accomplished scholar and an excellent poet. He was well versed in history, tradition, and poetry, which he could always quote on appropriate occasions. He possessed exquisite taste and unerring discernment, and his dignified demeanour made him an object of profound respect to high and low.

Haroun al Raschid is best known to Western readers as the hero of many of the stories in the *Arabian Nights*; and in Arabic literature he is the central figure of numberless anecdotes and humorous stories. Of his incognito walks through Baghdad, however, the authentic histories say nothing; and the account of his relations with Charlemagne, of which European historians speak, does not rest on a trustworthy basis. His reign is chiefly remarkable for the fact that a family belonging to the pure Persian aristocracy held for so long the reins of power under a caliph whose boast was that he was the only one who came of unmixed Hashimi blood, that of the family from which the prophet of El Islam sprung.

The principal authorities for the history of this period are—the Arabic histories of Ibn El Athir, Ibn Khaldun, and the Tarikh El Khamis; while the best European works to consult on the subject are Gibbon's *Decline and Fall of the Roman Empire*; Osborn's *Islam under the Caliphs of Bagdad*; and Weil's *Geschichte der Chalifen*. (E. H. P.)

HARP, a musical instrument of the string kind, approximating to triangular form from the strings diminishing in length as they ascend in pitch. While the instrument is of great antiquity, it is yet from northern Europe that the modern harp and its name are derived. The Greeks and Romans preferred to it the lyre in its different varieties, and a Latin writer, Fortunatus (vii. 8), describes it in the seventh century of our era as an instrument of the barbarians—"Romanusque lyra, plaudat tibi barbarus harpa." This is believed to be the earliest mention of the name, which is clearly Teutonic,—the Old High German "harapha," the Anglo-Saxon "harpe," the Old Norse "harpa." The modern French "harpe" retains the aspirate; in the Spanish and Italian "arpa" it is dropped.

For the origin of the instrument we have to look to Egypt, and the earliest delineations of it there give no indication that it had not existed long before. There are, indeed, representations in Egyptian paintings of stringed instruments of a bow-form that support the idea of the invention of the harp from the tense string of the warrior's or hunter's bow. This primitive-looking instrument was played horizontally, being borne upon the performer's shoulder. Between it and the grand vertical harps in the frescos of the time of Rameses III.,

more than 3000 years old, paintings discovered by the traveller Bruce (fig. 1), there are varieties that permit us to bind the whole, from the simplest bow-form to the almost triangular harp, into one family (see fig. 2).

The Egyptian harp had no front pillar, and it, being strung with catgut, the tension and pitch must necessarily have been low. The harps above-mentioned depicted in the tomb at Thebes, assumed from the players to be more than 6 feet high, have not many strings, the one, according to Wilkinson, having ten, the other thirteen. What the accordance was of these strings it would be to no satisfaction to follow Burney and others in trying to recover. We must be content with the knowledge that the old Egyptians possessed harps in principle like our own, the largest having pedestals upon which they bestowed a wealth of decoration, as if to show how much they prized them.

Fig. 1.

The ancient Assyrians had harps like those of Egypt in being without a front pillar, but differing from them in having the sound-body uppermost, in which we find the early use of soundholes; while the lower portion was a bar to which the strings were tied and by means of which the tuning was apparently effected. What the Hebrew harp was, whether it followed the Egyptian or the Assyrian, we do not know. That King David played upon the harp as commonly depicted is rather a modern idea. Mediæval artists frequently gave King David the psaltery, a horizontal stringed instrument from which has gradually developed the modern piano. The Hebrew "kinnor" may have been a kind of trigonon, a triangular stringed instrument between a small harp and a psaltery, probably sounded by a plectrum, or, as advocated by Dr Stainer in his essay on the music of the Bible, a kind of lyre.

Fig. 2.

The earliest records that we possess of the Celtic race, whether Gaelic or Cymric, give the harp a prominent place and harpists peculiar veneration and distinction. The names for the harp are, however, quite different from the Teutonic. The Irish "clairseach," the Highland Scotch "clarsach," the Welsh, Cornish, Breton, "telyn," "telcin," "têlen," show no etymological kinship to the other European names. The first syllable in clairseach or clarsach is derived from the Gaelic "clar," a board or table (sound-board), while the first syllable of telyn is distinctly Old Welsh, and has a teaisle meaning; thus resonance supplies the one idea, tension the other.

The literature of these Celtic harps may be most directly found in Bunting's *Ancient Music of Ireland*, Dublin, 1840; Gunn's *Historical Enquiry respecting the Performance on the Harp in the Highlands of Scotland*, Edinburgh, 1807; and E. Jones's *Musical and Poetical Memoirs of the Welsh Bards*, London, 1784. The treatises of Walker, Dalryell, and others may also be consulted; but in all these authorities due care must be taken of the bias of patriotism, and the delusive aim to reconstruct much that we must be content to receive as only vaguely indicated in records and old monuments. There is, however, one early Irish monument about which there can be no mistake, the harp upon a cross belonging to the

ancient church of Ullard near Kilkenny, the date of which cannot be later than 830; the sculpture is rude, but the instrument is clearly shown by the drawing in Bunting's work to have no front pillar. This remarkable structural likeness to the old harps of Egypt and Assyria may be accidental, but permits the plausible hypothesis of Eastern descent. The oldest specimen of the beautiful form the Irish harp is now recognized by, with gracefully curved front pillar and sweep of neck (the latter known as the harmonic curve), is the famous harp in Trinity College, Dublin, the possession of which has been attributed to King Brian Boireimhle. From this mythic ownership Dr Petrie (see essay in Bunting) has delivered it; but he can only deduce the age from the ornamentation and heraldry, which fix its date in the 14th century or a little later. There is a cast of it in South Kensington Museum, accurately described in the catalogue by Mr Carl Engel. The next oldest is in the Highlands of Scotland, the *Clarsach Lumanach*, or Lamont's Clarschoe, belonging, with another of later date, to the old Perthshire family of Robertson of Lude. Both are described in detail by Gunn. This Lamont harp was taken by a lady of that family from Argyleshire about 1460, on her marriage into the family of Lude. It had about thirty strings tuned singly, but the scale was sometimes doubled in pairs of unisons like lutes and other contemporary instruments. The Dalway harp in Ireland (fig. 3) inscribed "Ego sum Regina Cithararum," and dated 1621, appears to have had pairs of strings in the centre only. These were of brass wire, and played with the pointed finger nails. The Italian contemporary "Arpa Doppia" was entirely upon the duplex principle, but with gut strings played by the fleshy ends of the fingers. When Bunting met at Belfast in 1792 as many Irish harpers as could be at that late date assembled, he found

Fig. 3.— Irish (Dalway) Harp.

the compass of their harps to comprise thirty notes which were tuned diatonically in the key of G, under certain circumstances transposable to C and rarely to D, the scales being the major of these keys. The harp first appeared in the coat of arms of Ireland in the reign of Henry VIII.; and some years after in a map of 1567 preserved in a volume of State Papers, we find it truly drawn according to the outlines of the national Irish instrument. References to the Highlands of Scotland are of necessity included with Ireland; and in both we find another name for the harp, viz., "cruit." Bunting particularly mentions the "cinnard cruit" (harp with a high head) and the "crom cruit" (the curved harp). In the Ossianic MSS. of the Dean of Lismore (1512) the word "cruith" occurs several times, and in Neill McAlpine's *Gaelic Dictionary* (1832), which gives the dialect of Islay, closely related to that of Ulster, the word "cruit" is rendered "harp." In Irish of the 8th and 9th centuries (Zeuss) "cithara" is always glossed by "crot." True the modern Welsh "cwrth" is not a harp; but the expression of Fortunatus, "Chretta Britanna canat," has been too readily accepted as meaning the half-fiddle half-lyre which also bears the name of "cwrth" or "crowd." An old Welsh harp, not triple strung, exists, which bears a great resemblance to the Irish harp in neck, soundboard, and soundholes. The inference is fair that this was the form, although dimensions may have materially differed, of the Irish "crom cruit," while the triple strung harp with its elevated neck might be the form of the "cinnard cruit." But this does not imply derivation of the harp of Wales from that of Ireland or the reverse. There is really no good historical evidence, and there may have been a common or distinct origin on which ethnology only can throw light. The Welsh like the Irish harp was often an hereditary instrument to be preserved with great care and veneration, and used by the bards of the family, who were alike the poet-musicians and historians. A slave was not allowed to touch a harp, and it was exempted by the Welsh laws from seizure for debt. The old Welsh harp appears to have been at one time strung with horseshair, and by the Eisteddfod laws the pupil spent his noviciate of three years in the practice of a harp with that stringing. The comparatively modern Welsh triple harp (fig. 4) is always strung with gut. It has a rising neck as before stated, and three rows of strings,—the outer rows tuned diatonic, the centre one chromatic for the sharps and flats. Jones gives it 98 strings and a compass of 5 octaves and one note, from violoncello

Jones gives it 98 strings and a compass of 5 octaves and one note, from violoncello

C. As in all Celtic harps, the left is the treble hand, and in the triple harps there are 27 strings on that side, the right or bass hand having 37, and the middle or chromatic row 34.

Turning to the modern harp, the first pattern of it is discovered in German and Anglo-Saxon illuminated MSS. as far back as the 9th century. A diatonic instrument, it must have been common throughout Europe, as Orcagna, Fra Angelico, and other famous Italian painters depict it over and over again in their masterpieces. No accidental semitones were possible with this instrument, unless the strings were shortened by the player's finger. This lasted until the 17th century, when a Tyrolese maker adapted hooks (perhaps suggested by the fretted or bonded clavichord) that, screwed into the neck, could be turned downwards to fix the desired semitone at pleasure. At last, somewhere about 1720, Hochbrucker, a Bavarian, invented pedals that, acting through the pedestal of the instrument, governed by mechanism the stopping, and thus left the player's hands free, an indisputable advantage; and it became possible at once to play in no less than eight major scales. By a sequence of improvements, in which two Frenchmen named Cousineau took an important part, the various defects inherent in Hochbrucker's plan became ameliorated. The pedals were doubled, and, the tuning of the instrument being changed from the key of E♭ to C, it became possible to play in fifteen keys, thus exceeding the power of the keyboard instruments, over which the harp has another important advantage in the simplicity of the fingering, which is the same for every key.

It is to Sebastian Erard we owe the perfecting of the pedal harp (fig. 5), a triumph he gained in Paris by unremitting studies begun when he adopted a "fork" mechanism in 1786 and ended in 1810 when he had attained complete success. The mechanical perfection of Erard's apparatus must be seen to be appreciated. The pedals give the extent of movement the disks perform from which the studs project that stop the strings, as it may be required to raise the string in pitch a half tone or a whole tone. Erard's merit was not confined to this improvement only; he modified the structure of the comb that conceals the mechanism, and constructed the sound-body of the instrument upon a modern principle more advantageous to the tone.

FIG. 5.—Modern Erard Harp.

Notwithstanding these improvements and the great beauty of tone the harp possesses, the domestic use of it has for years past been declining. The great cost of a good harp, and the trouble to many amateurs of tuning, may have led to the supplanting of the harp by the more convenient and useful pianoforte. With this comes naturally a diminution in the number of solo-players on the instrument. Were it not for the increasing use of the harp in the orchestra, the colour of its tone having attracted the masters of instrumentation, so that the great scores of Meyerbeer and Gounod, of Berlioz, Liszt, and Wagner are not complete without it, we should perhaps know little more of the harp than of the dulcimer, in spite of the efforts of distinguished virtuosi whose devotion to their instrument maintains its technique on an equality with that of any other, even the most in public favour.

See, in addition to the works already referred to, Engel's *Musical Instruments in the South Kensington Museum*, 1874; and the articles "Harp," in Rees's *Cyclopaedia*, written by Dr Burney, in Stainer and Barrett's *Dictionary of Musical Terms*, 1876, and in Grove's *Dictionary of Music and Musicians*, 1879. (A. J. H.)

HARPER'S FERRY, a post village of Jefferson county, West Virginia, United States, is grandly situated at the foot

of Bolivar heights and at the confluence of the Shenandoah and Potomac rivers, where they intersect the Blue Ridge, 45 miles N.W. of Washington. It is the junction-point of the Baltimore and Ohio and the Winchester and Potomac railways; and the Ohio and Chesapeake canal passes along the Maryland side of the Potomac river. The village since the civil war has been in a decaying condition. It is the seat of Stover college, for students of colour. Previous to the war Harper's Ferry contained an extensive arsenal and armoury, and during the war it was the scene of several exploits which have given it a name in history. On the 16th October 1859 it was seized by John Brown, the celebrated abolitionist, and a small handful of followers, but as he was unsupported by a rising of the slaves he was overpowered on the morning of the 18th and taken prisoner. On the 18th April 1861 it was captured by the Confederates, who on evacuating it in the following June destroyed the arsenal and armoury and the bridge across the Potomac. The village was afterwards held by a Union garrison of 12,000 men, who, however, on the 15th September 1862, after a brave resistance of several days, surrendered to a strong Confederate force under Jackson and A. P. Hill. After the battle of Antietam, on the 17th of the same month, it was reoccupied by the army of the Potomac under General McClellan, who left a strong garrison in the place. In June 1863 it was again abandoned to the Confederates on their march to Pennsylvania. After their defeat at Gettysburg, the town again fell into the hands of the Federal troops, who held it until the demonstration against Washington in July 1864. After the battle of Monocacy on July 9th it was occupied by the United States forces, and held by them until the end of the war. The most flourishing part of the town was nearly destroyed by a flood in the Shenandoah October 1878. The population is about 2000.

HARPIES, or **HARPYIÆ**, a word from the root seen in *ἀρπάζω*, to snatch, are in Homer merely the embodiment of the rapacious power of violent winds. When a man has disappeared in a sudden and inexplicable fashion, it is said that the Harpies have carried him off; and the words *ἄρπυιαι* and *θύελλαι* are used indifferently (*cf. Od. xiv. 371* with *727*, and *xx. 66* with *77*) to indicate the agent in his sudden disappearance. But *Od. xx. 63-5* shows that the winds were conceived as carrying the man away to the banks of Oceanus, in other words, to the sky. So it is said (*H. Ven. 208*; *Schol. Il. xx. 244*) that a *θύεσπις ἄελλα* carried off Ganymede to heaven. There can be no doubt that the wind was by the primitive Indo-Germanic people considered to be the agent that carried off the souls of the dead to dwell with their fathers in heaven, and that this idea appears in the *Odyssey* (also *Il. vi. 345*) in a more fanciful form. As messengers of Zeus the Harpies are called *Διὸς κύνες* (*Ap. Rh., ii. 289*). In some accounts a Harpy is said to have become by Poseidon the mother of the horse Arion, and another form of the same union appears in *Il. xvi. 148*, when the harpy Podarge, grazing in a meadow by the stream of Oceanus, bears to Zephyrus (the fruitful generative wind) the two horses of Achilles. This myth, which occurs in numberless forms, has been explained in article **GORGONS**; from which it is clear that ultimately Harpy is another epithet, like Gorgo and Erinyes, of the swift, sudden, violent thunder-storm of a southern country. It is therefore with good ground that the three forms are compared by Æschylus (*Eum., 48*). The function of snatching away mortals to the other world leads up to the duty which the Greeks came to assign to the Erinyes of pursuing and punishing certain kinds of offenders (see **FURIES**). In *Od. xx. 66 sq.* it is related that the orphan daughters of Pandareus went up under the care of the gods; but when Aphrodite went to Olympus to beg to perfect their life by a marriage, the Harpies carried them off and

delivered them to the Erinyes. In these two daughters, one of whom is the nightingale (*Od.* xx. 518), and the other probably the swallow (*v. Sonne* in Kuhn's *Zeitschrift*, x., 121), we recognize the spring growing up in beauty till it is suddenly snatched away from the earth by the storms of autumn. Hesiod (*Theog.*, 267) says that the Harpies, Aello and Ocypete, winged goddesses with beautiful locks, are the daughters of Thaumas and Electra. Other accounts make them children of Poseidon or of Phineus, always the sun in some form; while a third, Celæno, is often added to their number. As we come down later in literature, a more hateful and repulsive character attaches to the Harpies. This is especially seen in the myth of the blind king Phineus, the sun-god in the dark winter months, tormented by the Harpies, where the transforming fancy of the poets can be traced more and more. Hesiod related (*Strabo*, vii. 463) that the Harpies carried off Phineus to the land of the Glectophagi, a mythic people, who represent like the Hyperboreans or the Phæacians the race of the dead, the Pitris or Manes. The myth was incorporated as an episode in the tale of the Argonauts, and is then imitated by Virgil with still more nauseous details (*Æn.* iii. 212). On the so-called Harpy monument from Lycia, now in the British Museum, they appear as winged figures, the body like that of a bird with the head and bust of a woman. They are carrying off small figures, probably departed souls.

HARPOCRATES, originally an Egyptian deity, was adopted by the Greeks, and became in later times an object of worship both to Greeks and Romans. In Egypt Harpa-khruti, Horus the child, was one of the forms of Horus, the sun-god, the child of Osiris (see EGYPT, vol. vii. p. 717). Hence Herodotus (ii. 144) considers him the same as the Greek Apollo. He was said by the Greeks to have been born with his finger on his lips, and is thus represented in statues. As the god of silence he became a favourite deity among the later mystic schools of philosophy. Festivals with certain mysterious rites were celebrated in his honour.

HARPY, a large diurnal bird of prey, so named after the mythological monster of the classical poets,—the

to Brazil. Though known for more than two centuries, its habits have come very little under the notice of naturalists, and what is said of them by the older writers must be received with some suspicion. A cursory inspection of the bird, which is not unfrequently brought alive to Europe, its size, and its enormous bill and talons, at once suggest the vast powers of destruction imputed to it, and are enough to account for the stories told of its ravages on mammals, — sloths, fawns, peccaries, and spider-monkeys. It has even been asserted to attack the human race. How much of this is fabulous there seems no means at present of determining, but some of the statements are made by voracious travellers—D'Orbigny and Tschudi. It is not uncommon in the forests of the isthmus of Panama, and Mr Salvin says (*Proc. Zool. Society*, 1864, p. 368) that its flight is slow and heavy. Indeed its Owl-like visage, its short wings and soft plumage, do not indicate a bird of very active habits, but the weapons of offence with which, as above stated, it is armed, show that it must be able to cope with vigorous prey. Its appearance is sufficiently striking—the head and lower parts, except a pectoral band, white, the former adorned with an erectile crest, the upper parts dark grey banded with black, the wings dusky, and the tail barred; but the huge bill and powerful scutellated legs most of all impress the beholder. The precise affinities of the Harpy cannot be said to have been determined. By some authors it is referred to the Eagles, by others to the Buzzards, and by others again to the Hawks; but possibly the first of these alliances is the most likely to be true. (A. N.)

HARRIER. See DOG.

HARRIER, or HEN-HARRIER, name given to certain birds of prey which were formerly very abundant in parts of the British Islands, from their habit of harrying poultry. The first of these names has now become used in a generic

Harpy.

Thrasaetus harpyia of modern ornithologists,—an inhabitant of the warmer parts of America from Southern Mexico

Hen-Harrier (Male and Female).

sense for all the species ranked under the genus *Circus* of Lacépède, and the second confined to the particular species which is the *Falco cyaneus* of Linnæus and the *Circus cyaneus* of modern ornithologists.

On the wing Harriers have much resemblance to Buzzards, using the same flapping stroke of the pinions, and wheeling or sailing aloft as they fly. One European species indeed, *C. aruginosus*, though called in books the Marsh-Harrier, is far more commonly known in England and Ireland as the Moor-Buzzard. But Harriers are not, like Buzzards, arboreal in their habits, and always affect open country, generally, though not invariably, preferring marshy or fenny districts, for snakes and frogs form a great part of their ordinary food. On the ground their carriage is utterly unlike that of a Buzzard, and their long wings and legs

render it easy to distinguish the two groups when taken in the hand. All the species also have a more or less well-developed ruff or frill of small tickset feathers surrounding the lower part of the head, nearly like that seen in Owls, and accordingly many systematists consider that the genus *Circus*, though undoubtedly belonging to the *Falconidae*, connects that Family with the *Striges*. No osteological affinity, however, can be established between the Harriers and any section of the Owls, and the superficial resemblance will have to be explained in some other way. Harriers are found almost all over the world,¹ and fifteen species are recognized by Mr Sharpe (*Cat. Birds Brit. Museum*, i. pp. 50-73). In most if not all the Harriers the sexes differ greatly in colour, so much so that for a long while the males and females of one of the commonest and best known, the *C. cyaneus* above mentioned, were thought to be distinct species, and were or still are called in various European languages by different names. The error was maintained with the greater persistency since the young males, far more abundant than the adults, wear much the same plumage as their mother, and it was not until after Montagu's observations were published at the beginning of the present century that the "Ringtail," as she was called (the *Falco pygargus* of Linnæus), was generally admitted to be the female of the "Hen-Harrier." But this was not Montagu's only good service as regards this genus. He proved the hitherto unexpected existence of a second species,² subject to the same diversity of plumage. This was called by him the Ash-coloured Falcon, but it now generally bears his name, and is known as Montagu's Harrier, *C. cineraceus*. In habits it is very similar to the Hen-Harrier, but it has longer wings, and its range is not so northerly, for while the Hen-Harrier extends to Lapland, Montagu's is but very rare in Scotland, though in the south of England it is the most common species. Harriers indeed in the British Islands are rapidly becoming things of the past. Their nests are easily found, and the birds when nesting are easily destroyed. In the south-east of Europe, reaching also to the Cape of Good Hope and to India, there is a fourth species, the *C. swainsoni* of some writers, the *C. pallidus* of others. In North America *C. cyaneus* is represented by a kindred form, *C. hudsonius*, usually regarded as a good species, the adult male of which is always to be recognized by its rufous markings beneath, in which character it rather resembles *C. cineraceus*, but it has not the long wings of that species. South America has in *C. cinereus* another representative form, while China, India, and Australia possess more of this type. Thus there is a section in which the males have a strongly contrasted black and grey plumage, and finally there is a group of larger forms allied to the European *C. aeruginosus*, wherein a grey dress is less often attained, of which the South African *C. ranivorus* and the New Zealand *C. gouldi* are examples. (A. N.)

HARRINGTON, JAMES (1611-1677), a distinguished writer on the philosophy of government, was sprung from an old family in Rutlandshire, and was born in January 1611. He received a careful education, and in his eighteenth year entered Trinity College, Oxford, as a gentleman commoner. One of his tutors was the famous Chillingworth. At the close of his university career he set out to travel on the Continent, and proceeded first to Holland, where he spent several years. He served some time in the Dutch army, and enjoyed the friendship both of the prince

of Orange and of the queen of Bohemia. After visiting France and Italy, he returned to England and lived in retirement till 1646, when he was named one of the grooms of the bed-chamber to Charles I. who was at that time being conveyed south from Newcastle as prisoner of the parliament. Though republican in his ideas, Harrington secured the confidence and respect of the king, who showed strong personal regard for him. On the removal of Charles to the Isle of Wight, Harrington was prevented from accompanying him, and was for a short time put in confinement because he would not swear to refuse assistance to the king should he attempt to escape. His feelings of respect led him also to accompany Charles to the scaffold in the following year.

After Charles's death Harrington once more withdrew into private life and devoted his time to the composition of his work on the theory of the state, afterwards published under the title of *Oceana*. The nature of his views was well known, and, as they pleased neither republicans nor royalists, the work was naturally regarded with some suspicion. By order of Cromwell the *Oceana* was seized when passing through the press. Harrington, however, managed to secure the favour of the Protector's favourite daughter, Mrs Claypole; the work was restored to him, and appeared in 1656, dedicated to Cromwell. The views embodied in *Oceana*, particularly that bearing on vote by ballot and rotation of magistrates and legislators, Harrington and others who formed a club called the "Rota" endeavoured to push practically, but with no success. In December 1661, by order of Charles II., Harrington was arrested on a charge of conspiracy, and though there seem to have been no sufficient grounds for the accusation, he was thrown into prison. Despite his repeated request no public trial could be obtained, and when at length he endeavoured to protect himself by claiming the right of *habeas corpus*, he was secretly removed to a small island off Plymouth. There his health completely gave way, and his mind appeared to be affected. By careful treatment he was restored to bodily vigour, but it is supposed that his mind never recovered its tone. After his release he married,—at what date does not seem to be precisely known. He died September 11, 1677.

Harrington's books consist of the *Oceana*, and of papers, pamphlets, aphorisms, even treatises, in support and defence of the *Oceana*. The *Oceana* is not a philosophical romance; it is a hard, prolix, and in many respects heavy exposition of a new method for constituting civil society. The details are elaborated with infinite care, even the salaries of officials being computed, but the important or leading ideas in the book are two in number, with two practical precepts following from them. The first is that the determining element of power in a state is property generally, property in land in particular; the second is that the executive power ought not to be vested for any considerable length of time in the hands of the same men or class of men. As practical corollary to his first proposition Harrington recommends an agrarian law, limiting the portion of land held to that yielding a revenue of £2000, and consequently insisting on particular modes of distributing landed property. As a practical maxim following from the second he lays down the rule of rotation by ballot. A third part of the executive, senate, or whatever it might be, are voted out by ballot every year (not being capable of being elected again for three years). Harrington explains very carefully how the state and its governing parts are to be constituted by his scheme, and *Oceana* undoubtedly contains many valuable ideas. As a book, however, it is irretrievably dull.

His *Works* were edited by Toland in 1700; Toland's edition, with additions by Birch, appeared in 1747, and again in 1771.

HARRINGTON, SIR JOHN. See HARRINGTON.

¹ The distribution of the different species is rather curious, while the range of some is exceedingly wide,—one, *C. maillardi*, seems to be limited to the island of Réunion (Bourbon).

² A singular mistake, which has lately been productive of further error, was made by Albin, who drew his figure (*Hist. Birds*, ii., pl. 5) from a specimen of one species, and coloured it from a specimen of the other.

HARRIOT, or HARRIOTT, THOMAS (1560-1621), an English mathematician and astronomer, was born at Oxford in 1560. After studying at St Mary's Hall, Oxford, where he took his bachelor's degree in 1579, he became tutor to Sir Walter Raleigh, who in 1585 appointed him to the office of geographer to the second expedition to Virginia. Harriot published an account of this expedition in 1588, and the work was afterwards reprinted in Hakluyt's *Voyages*. On his return to England after an absence of two years, he resumed his mathematical studies with zeal and success; and having made the acquaintance of Henry Percy, earl of Northumberland, distinguished for his patronage of men of science, he received from him a yearly pension of £120. He died at London 2d July 1621, after having suffered much from a cancer in the lip, occasioned it is supposed by a habit he had contracted of holding in his mouth instruments of brass often charged with verdigris. A manuscript of Harriot's entitled "Ephemeris Chrysmetria" is preserved in Sion College; and his *Artis Analyticae Praxis ad Aequationes Algebraicas resolvendas* was published at London in 1631. An account of his contributions to the science of algebra will be found in the article ALGEBRA, vol. i. p. 514; and Wallis's *History of Algebra* (1685) may also be consulted. From some papers of Harriot's discovered in 1784 it would appear that he had either procured a telescope from Holland, or divined the construction of that instrument, and that he coincided in point of time with Galileo in discovering the spots on the sun's disk.

HARRIS, JAMES (1709-1780), a distinguished English writer on the subject of grammar, was born at Salisbury on the 20th of July 1709. He received his early education at Salisbury, whence he was removed to Oxford at the age of sixteen; and, having passed the usual number of years as a gentleman commoner at Wadham College, he was entered at Lincoln's Inn as a student of law, though not intended for the bar. When he had attained his twenty-fourth year his father died; and this event, having at once freed him from all control, and placed him in the possession of an independent fortune, enabled him to exchange the study of law for other pursuits more congenial to his taste. The decided bent of his mind had always been towards the Greek and Latin classics; and to the study of these he now applied himself with unremitting assiduity during a period of fourteen or fifteen years. The first fruit of this lengthened course of application was a volume which he published in 1744, containing three treatises—one on art, another on music, painting, and poetry, and a third on happiness. In 1751 appeared the work by which he is best known, *Hermes*, a philosophical inquiry concerning universal grammar. Although *Hermes* had considerable reputation in its day as a treatise on grammar, it must now be regarded as antiquated, and even as erroneous in conception. It is not so much a work on grammar as an attempt to force upon grammatical forms a strictly logical significance, to discover the groundwork of all grammars by analysing the thoughts to be expressed in words. This method, as we now recognize, is incapable of throwing light upon the oral structure and growth of language and grammatical forms. In 1775 Harris published his *Philosophical Arrangements*, part of a larger work which he had meditated, but did not complete, on the peripatetic logic. It is in fact a commentary on Aristotle's categories, and an attempt to discuss problems of more recent philosophy by the Aristotelian notions. The *Philological Inquiries* is a pleasantly written but slight work on the principles of literary criticism and style. It is the least pedantic of all his works. Harris died in December 1780. His works were collected and published in 2 vols., 1801, by his son, Lord Malmesbury, who prefixed a brief biography.

HARRIS, JOHN, D.D. (c. 1667-1719), an English writer, best known as the editor of the *Lexicon Technicum*, which ranks as the earliest of the long line of English encyclopædias, and as the compiler of the *Collection of Voyages and Travels* which passes under his name. He was educated at St John's College, Cambridge, where he took his B.A. degree in 1687, and proceeded M.A. in 1690. Having entered the church, he was soon presented to the rectory of Winchelsea in Sussex; and as early as 1698 he was in sufficient repute as a learned divine to be entrusted with the delivery of the seventh series of the Boyle lectures—*Atheistical Objections against the Being of God and His Attributes fairly considered and fully refuted*. Between 1702 and 1704 we find him lecturing on mathematics on the foundation of Charles Cox, and advertizing himself as a mathematical tutor at Amen Corner. The friendship of Sir William Cowper, afterwards lord chancellor, soon after raised him to a much higher position. Besides receiving the office of private chaplain to Sir William, he was presented in 1708 with a prebend in Rochester Cathedral, and appointed to the rectory of the united parishes of St Mildred, Bread Street, and St Margaret Moses. In this position he showed himself an ardent supporter of the Government, and got into a bitter quarrel with the Rev. Charles Humphreys, who afterwards was chaplain to Dr Sacheverel. Harris was one of the early members of the Royal Society, and for a time acted as vice-president. Besides his contributions to the society's *Transactions*, and the two important works by which he is still remembered, he published a number of treatises on mathematics and occasional sermons; and at his death on September 7, 1719, he was busy completing an elaborate *History of Kent*, of which the first volume had just left the press. He is said to have died in poverty brought on by his own bad management of his affairs. There is only one good account of his life, that by Nichols in the *Literary Anecdotes*, vol. ix., and this even, owing to scarcity of materials, is strangely defective.

HARRIS, JOHN (1802-1856), divine and theologian, was born at Ugborough in Devonshire, March 8, 1802. At the age of fifteen he joined the Independent Church, and began to preach to the rustics of the neighbourhood as a member of the Bristol Itinerant Society. After studying at the Independent college at Hoxton he was in 1827 ordained pastor of a small congregation at Epsom. There in 1836 he wrote his essay, *Mammon, or Covetousness the Sin of the Christian Church*, which won a prize of 100 guineas offered by Dr Conquest, and brought its author into notice, thirty thousand copies being sold within a few years. In 1838 he received the degree of doctor of divinity from Brown University, America, and was appointed president and professor of theology in Cheshunt college; and in 1850, when the Independent colleges at Highbury, Homerton, and Coward, near London, were united, Dr Harris was elected principal of the New College thus formed. He died December 21, 1856.—

Besides *Mammon*, he wrote the *Great Teacher* (1835); two prize essays, *Britannia* (1837) and *The Great Commission* (1842); and *Contributions to Theological Science. The Pre-Adamite Earth* (1847), *Man Primæval* (1849), and *Patriarchy* (1855), form the beginning of a series, intended to illustrate the history of man from a theological point of view, but interrupted by his death.

HARRIS, SIR WILLIAM SNOW (1791-1867), a distinguished electrician, was descended from an old family of Plymouth solicitors, and was born there 1st April 1791. He received his early education at the Plymouth grammar-school, and completed a course of medical studies at the university of Edinburgh, after which he established himself as a general medical practitioner in Plymouth. On his marriage in 1824 he resolved to abandon his profession on account of its duties interfering too much with his favourite

study of electricity. As early as 1820 he had invented a new method of arranging the lightning conductors of ships, the peculiarity of which was that the metal was permanently fixed in the masts and extended throughout the hull; but it was only with great difficulty, and not till nearly thirty years afterwards, that his invention was adopted by the Government for the royal navy. In 1826 he read a paper before the Royal Society "On the Relative Powers of various Metallic Substances as Conductors of Electricity," which led to his being elected a member of the society in 1831. Subsequently, in 1834, 1836, and 1839, he read before the society several valuable papers on the elementary laws of electricity, and he also communicated to the Royal Society of Edinburgh various interesting accounts of his experiments and discoveries in the same field of inquiry. In 1835 he received the Copley gold medal from the Royal Society for his papers on the "Laws of Electricity by High Tension," and in 1839 he was chosen to deliver the Bakerian lecture. Meanwhile, although a Government commission had recommended the general adoption of his conductors in the royal navy, and the Government had granted him an annuity of £300 "in consideration of services in the cultivation of science," the naval authorities continued to offer various objections to his invention; to aid in removing these he in 1843 published his work on *Thunderstorms*, and also about the same time contributed a number of papers to the *Nautical Magazine* illustrative of damage by lightning. His system was actually adopted in the Russian navy before he succeeded in removing the prejudices against it in England, and in 1845 the emperor of Russia in acknowledgment of his services presented him with a valuable ring and a superb vase. At length, every doubt as to the efficiency of his system having been removed, he received in 1847 the honour of knighthood, and subsequently a grant of £5000. After succeeding in introducing his invention into general use Harris resumed his labours in the field of original research, but as he failed to realize the advances that had been made by the new school of science his application resulted in no discoveries of much value. His manuals of *Electricity*, *Galvanism*, and *Magnetism*, contributed to Weale's rudimentary series, were however written with great clearness, and passed through several editions. He died 22d January 1867, while having in preparation a *Treatise on Frictional Electricity*, which was published posthumously in the same year, with a memoir of the author by Charles Tomlinson, F.R.S.

HARRISBURG, a city of the United States, capital of Dauphin county and of the State of Pennsylvania, is beautifully situated on the east bank of the Susquehanna river, on the Pennsylvania canal, and at the junction of several railways, 126 miles by rail N. of Washington and 105 W. by N. of Philadelphia. The river, which is here a mile in width, is crossed by two bridges, one of which is for the use of the railways. Two other bridges of great beauty and strength span the river in view of the State-house. The State buildings, dating from 1819, occupy an eminence in the centre of the busiest portion of the city, and consist of the State capitol, 180 feet long by 80 feet wide, with a circular portico in front supported by six Ionic columns and surmounted by a dome, and, on two sides of the capitol, smaller buildings uniform in design, containing the executive chamber, the State treasury, and various other offices. The capitol park contains a monument to those who died in the Mexican war. Among the other public buildings are the county court-house, the State arsenal, the county prison, and the opera-house. Harrisburg is a bishop's see of the Roman Catholic Church. It is well provided with academies and schools, and possesses about 30 churches, several of which are costly and ornamental edifices. It is also the seat of

the State library of over 40,000 volumes. Among the benevolent institutions are the city hospital, the home for the friendless, and the State lunatic hospital. An abundant water supply is obtained from the river. Coal and iron are largely wrought in the neighbourhood, and the great facilities of communication both by canal and railway have enabled the city to become one of the centres of the iron trade. It possesses large iron-foundries, manufactories of steel, machines, boilers, engines, carriages, nails, files, galvanized iron, brooms, soap, and shoes, rolling-mills, saw and planing mills, flour-mills, cotton-mills, potteries, tanneries, and breweries. The inhabitants in 1860 numbered 13,405, and in 1870 23,104. The population of the city proper for 1880 is estimated at 31,700, and that of the suburbs at 4900, making a total of 36,600.

Harrisburg received its name from John Harris, an Englishman who settled on the site of the town in 1726, and whose son established a ferry over the Susquehanna in 1753. The town was founded in 1785 under the name of Harrisburg, which was afterwards changed to Louisbourg; in 1791 it was incorporated under its present name; in 1812 it became the capital of the State; and in 1860 it was made a city.

HARRISON, JOHN (1693-1776), an eminent mechanician, was the son of a carpenter, and was born at Faulby, near Pontefract, in Yorkshire, in the year 1693. Thence his father and family removed in 1700 to Barrow, in Lincolnshire. Young Harrison at first learned his father's trade, and worked at it for several years, at the same time occasionally making a little money by land-measuring and surveying. The strong bent of his mind, however, was towards mechanical pursuits; and this showed itself specially in endeavours to improve the construction of clocks and watches so as to render them more accurate measurers of time. He soon learned that, to enable a clock to keep accurate time, the pendulum must be so constructed as to preserve the distance between the point of suspension and centre of oscillation invariable, notwithstanding the expansion and contraction of the rod caused by changes of temperature. To accomplish this Harrison devised, in 1726, his ingenious "gridiron pendulum," which consists in having the bob suspended by a series of parallel rods, alternately of steel and brass, so arranged that the downward expansion of the steel rods from change of temperature is exactly compensated for by the upward expansion of the brass rods. This principle of compensation, modified to suit particular cases, is now applied to all good watches and chronometers. Another ingenious improvement in clockmaking devised by Harrison was his recoil escapement, which obviated the necessity of keeping the pallets well-oiled. He was led to invent this, as he himself tells us, by having on one occasion had to go a long distance to set right a turret clock which had stopped simply from want of oil on the pallets. This escapement, although answering admirably the intended purpose, is rather too delicate to be adopted in ordinary practice. Harrison was also the first to employ the commonly used and effective form of "going ratchet," which is a spring arrangement for keeping the timepiece going at its usual rate during the interval of being wound up.

In Harrison's time the Government of the country had become fully alive to the necessity of determining more accurately the longitude at sea. For this purpose they passed an Act in 1714 offering rewards of £10,000, £15,000, and £20,000 to any who should construct chronometers that would determine the longitude within 60, 40, and 30 miles respectively. Harrison applied himself vigorously to the task, and in 1735 went to the Board of Longitude with a watch which he also showed to Halley, Graham, and others. Through their influence he was allowed to proceed in a king's ship to Lisbon to test

it; and the result was so satisfactory that the commissioners gave him £500 to carry out further improvements. Harrison worked at the subject with the utmost perseverance, and, after making several watches, went up to London in 1761 with one which he considered very perfect. His son William was sent on a voyage to Jamaica to test it; and, on his return to Portsmouth in 1762, the watch was found to have lost only 1 minute $54\frac{1}{2}$ seconds. This was surprisingly accurate, as it determined the longitude within 18 miles, and Harrison claimed the full reward of £20,000. After some further trials £10,000 of it was paid to him in 1765, and the remainder in 1767, after he had written such a description of his instrument as would enable other artists to copy it. Harrison died in 1776, at the age of eighty-two. His want of early education was felt by him greatly throughout life. He was unfortunately never able to express his ideas clearly in writing, although in conversation he could give a very precise and exact account of his many intricate mechanical contrivances. He wrote a book entitled *Description concerning such Mechanism as will afford a Nice or True Mensuration of Times*.

HARRISON, WILLIAM HENRY (1773-1841), ninth president of the United States, third son of Governor Benjamin Harrison, was born at Berkeley, Charles county, Virginia, February 9, 1773. In 1792 he joined the army with the commission of ensign, and in the following year he became lieutenant and acted as aide-de-camp to Wayne in his expedition against the Western Indians. He was promoted to a captaincy in 1795, but resigned in 1797 on being appointed secretary of the North-West Territory. In 1799 he was chosen to represent that territory in congress, and after its division in 1801 he became governor of the new territory of Indiana and superintendent of negotiations with the Indians, over whom, on the breaking out of hostilities in 1811, he gained the important victory of Tippecanoe. In 1813 as major-general and commander of the north-western army he defeated the British forces at the battle of the Thames. In 1814 he concluded a treaty with the North-Western Indians, and in the same year he resigned his commission. He was elected in 1816 member of congress for Cincinnati, in 1819 member of the State senate of Ohio, in 1824 United States senator, and in 1828 minister to Colombia, an office which he held for less than a year, when he retired for a time into private life. By the urgent request of the Whigs he was induced in 1836 to stand for the presidency of the United States, and though unsuccessful, he at the next election in 1840 defeated the same candidate Van Buren by an overwhelming majority, after a canvass memorable for the extraordinary enthusiasm it awakened, and historically important for its introduction of new political methods—many of the most characteristic features of Western elections having their origin in this "Harrison campaign." He was scarcely spared, however, to enter upon the discharge of his duties as president, dying April 4, 1841, about a month after his inauguration. Harrison published at Cincinnati in 1838 a small treatise on the Indians entitled *A Discourse on the Aborigines of the Ohio Valley*.

HARROGATE, a town and watering-place in the West Riding of Yorkshire, England, is beautifully situated on a fine plateau near the River Nidd, 18 miles W. of York. It is indebted for its rise and importance to its medicinal springs, and is now the principal inland watering-place in the north of England. It consists of two scattered townships, Low Harrogate and High Harrogate, which have gradually been connected by a continuous range of handsome houses and villas. A common of 200 acres, which is secured by act of parliament from ever being built upon, stretches in front of the main line of houses, and on this account Harrogate, notwithstanding its rapid

increase, has retained all its rural charm. As the town is equidistant from the east and west coasts, its air is supposed to possess certain special qualities, and there is the further advantage of a choice between the more bracing atmosphere of High Harrogate and the sheltered and warm climate of the low town. The waters are chalybeate, sulphureous, and saline, and some of the springs possess all these qualities to a greater or less extent. The principal chalybeate springs are the Tewitt well, called by Dr Bright, who wrote the first account of it, the "English Spa," discovered by Captain William Slingsby of Bilton Hall about the year 1570; the Royal Chalybeate Spa, more commonly known as John's Well, discovered in 1631 by Dr Stanhope of York, and provided with a neat octagonal building erected in 1842; Muspratt's chalybeate or chlorido of iron spring discovered in 1819, but first properly analysed by Dr Sheridan Muspratt in 1865; and the Starbeck springs midway between High Harrogate and Knaresborough. The principal sulphur springs are the old sulphur well in the centre of Low Harrogate, discovered about the year 1656; the Montpellier springs, the principal well of which was discovered in 1822, situated in the grounds of the Crown Hotel and surmounted by a handsome building in the Chinese style containing pump-room, baths, and reading-room; and the Harlow Car springs, situated in a wooded glen about a mile west from Low Harrogate. Near Harlow Car is Harlow observatory, a square tower 100 feet in height, standing on elevated ground and commanding a very extensive view. A saline spring situated in Low Harrogate was discovered in 1783. Besides the hotels and churches, the principal public buildings are the High Harrogate college, a boarding-school for young gentlemen; the new Victoria baths, erected in 1871 at a cost of £20,000; the Bath hospital for poor patients, founded in 1824; and the Rogers almshouses, founded in 1860. About a mile to the south-east of Harrogate the Crayke valley is spanned by a railway viaduct 1850 feet in length. The population of the town in 1861 was 4737, and in 1871 6843.

HARROW-ON-THE-HILL, a village of Middlesex, England, 10 miles N.W. of London, derives the latter part of its name from its position on a hill which rises from the surrounding plain to the height of about 200 feet. On the summit, and forming a conspicuous landmark, is the church of St Mary, said to have been founded by Lanfranc, archbishop of Canterbury, in the reign of William I., but of the original building very little is now left. Harrow is chiefly celebrated for its school, founded in 1571 by John Lyon, a yeoman of the neighbouring village of Preston who had yearly during his life set aside 20 marks for the education of poor children of Harrow. Though the charter was granted by Queen Elizabeth in 1571, and the statutes drawn up by the founder in 1590, two years before his death, it was not till 1611 that the first building was opened for scholars. Lyon originally settled about two-thirds of his property on the school, leaving the remainder for the maintenance of the highway between London and Harrow, but in the course of time the values of the respective endowments have changed, and while the road commissioners receive about £3500, the school's share is only about £1600. In 1660 the headmaster, taking advantage of a concession in Lyon's statutes, began to receive "foreigners," i.e., boys from other parishes, who were to pay for their education. From this time the prosperity of the school may be dated. In 1809 the parishioners of Harrow appealed to the Court of Chancery against the manner in which the school was conducted, but the decision, while it recognized their privileges, confirmed the right of admission to foreigners. At present foundationers receive their education at a slightly

cheaper rate than foreigners; there are none who are taught gratis. The government of the school was originally vested in six persons of standing in the parish, who had the power of filling vacancies in their number by election among themselves; but under the Public Schools Act of 1863 the governing body now consists of the surviving members of the old board, besides six new members elected respectively by the Lord Chancellor, the universities of Oxford, Cambridge, and London, the Royal Society, and the assistant masters of the school. There is a considerable number of fellowships and scholarships in connexion with the school to both the great English universities, some to special colleges, others to colleges in the choice of the holders. The general mode of instruction and discipline is modelled on that of Eton, where most of the former headmasters of Harrow were educated. Originally an exclusively classical school, mathematics became in 1837 a compulsory study at Harrow; modern languages, compulsory on the upper forms only since 1851, were extended to the whole school in 1855; while English history and literature began to be more especially studied about 1869. Science, music, and drawing are now also taught. Among the famous men who have been educated here may be mentioned Bruce, the Abyssinian traveller, Sir William Jones, the Orientalist, Dr Parr, who was born at Harrow, Admiral Rodney, Sheridan, Byron Peel, Theodore Hook, Lord Palmerston, Lord Herbert of Lea, the earl of Shaftesbury, and Archbishop Trench. Comparatively little change was made in the school buildings till 1819, when the new portion was begun; but since that time improvements and additions have steadily increased. In 1839 a school-chapel was consecrated; but this has been gradually replaced by a handsomer edifice completed in 1857. The Vaughan library was built in 1861-63, and a hospital for the boys in 1865. A new speech room, a gymnasium, and laboratories have been erected out of the Lyon Tercentenary Fund, subscribed since 1871. The population of the parish in 1871 was 8537, and of the local board district 4997.

HARRY, BLIND, or HENRY THE MINSTREL, author of a poem in twelve books, entitled *The Actis and Deidis of the illuster and vailzeand campioun, Schir William Wallace, Knight of Ellerslie*. All that is known of Henry's personal history is contained in the following quotation from Major:—"Henry, who was blind from his birth, composed in the time of my youth the whole book of William Wallace, and embodied all the traditions about him in the ordinary measure, in which he was well skilled. By the recitation of these in the presence of the great, he procured, as indeed he deserved, food and clothing." Major was born about 1469, and the only MS. copy of Henry's works is that in the Advocates' Library, Edinburgh, dated 1488. It was first printed at Edinburgh in 1570. In his *Lives of Scottish Worthies*, P. F. Tytler claims for it a certain historical worth, as "the work of an ignorant man, who was yet in possession of valuable and authentic materials." On account of its glorification of the national hero it has enjoyed a long popularity among the Scottish peasantry, but it possesses no poetical merit except a certain rude fire and energy, and as a literary production its place must be reckoned a very humble one.

HARTE-BEEST (*Alcelaphus caama*), a species of antelope, occurring in considerable numbers throughout southern and central Africa. It stands nearly 5 feet high at the shoulders, and is somewhat ungainly in form owing to the disproportionate development of its fore and hind quarters—a difference which gives to the posterior limbs when in motion an appearance of weakness. The head is long and narrow, and is crowned in both sexes by a pair of nearly cylindrical horns, ringed throughout their lower half

and smooth above. The hair of this species is short, soft, and recumbent, and is of a brownish-yellow colour above and nearly white beneath, the colour, however, being to some extent dependent on age and sex and on the season of the year. The harte-beest is gregarious, living in herds of from five to ten individuals, and frequenting tracts of uninhabited wilderness, or the light brush forest in the neighbourhood of rivers. It is exceedingly wary, and consequently difficult of approach, and when suddenly come upon, the entire herd, according to Sir Andrew Smith, scampers off in the train of a leader,—the herd being rarely seen, when in flight, otherwise than in a string, one treading on the footsteps of another. Of a mild and gentle disposition, the harte-beest seeks safety, whenever it can, in flight; when at bay, however, it does not hesitate to turn upon its pursuers and to make use of its powerful horns as weapons of offence. During the heat of the day it is said to rest

Harte-beest.

leaning against the trunks of trees, when the colour of its body so harmonizes with that of the bark as frequently to enable it to elude observation. Dr Schweinfurth, who had frequent opportunity of observing those animals in central Africa, describes a curious and as yet unexplained habit of which he was himself a witness. Having approached nearer to a herd of harte-beests than usual without attracting their attention, he observed them running in couples like the horses in a circus, "going round and round a clump of trees, whilst the others stood in groups of three or four intently watching them. After a time these in turn took their places, and, two at a time, ran their own circuit in a similar fashion." He conjectures that the performance had probably some connexion with pairing time. The flesh of this species is considered superior to that of any other South African antelope, the eland alone excepted.

HARTFORD, a city in the United States of North America, in 41° 45' 59" N. lat., 72° 40' 45" W. long., is the eastern portion of the town of the same name, the county seat of Hartford county, and the capital of the State of Connecticut. It is situated on the west bank of the Connecticut river, 60 miles from Long Island Sound, at the head of steamboat and sloop navigation, and 100 miles N.E. of New York and 95 W.S.W. of Boston by rail. An important centre of railway communication, it has also regular lines of steamboats and packets, besides some 200 sailing craft engaged in the coasting trade. The river is usually closed from the middle of December to the
